First, and importantly, there is virtually universal disdain for the tobacco industry's practices – historically, currently and what appears destined to occur in the future. Second, despite that disdain, many faculty are concerned about setting a precedent that could have inadvertent consequences for the University's research mission. That was evidenced at the Thursday, May 17th meeting of the Academic Senate when a majority of the voting members (deans and University officials are non-voting ex officio members) elected to deny the proposal and thus uphold the long-standing University policy, which states that *“Individual scholars should be free to select the subject matter of their research, to seek support from any source for their work and form their own findings and conclusions.”* Regardless of our views, we should now lay this matter to rest. While some medical schools (Harvard, Johns Hopkins) have developed separate policies from their parent universities that ban tobacco funding, I would not support moving in that direction at Stanford. I strongly believe that our research community should be united under one set of policies and regulations.

However, we do have a responsibility and an opportunity to demonstrate and voice our core mission of promoting human health. Given the irrefutable evidence that tobacco use is one of the most serious threats to health, the medical school will be enacting policies later this summer that will further restrict smoking or tobacco use on its campus – outdoors in addition to the indoor restrictions that are currently in place. Part of the reason for this decision is the evidence that even outdoor smoking can contribute to adverse health consequences (see July 7th Stanford Report: <http://news-service.stanford.edu/news/2004/july7/med-smokefree-77.html>). In banning smoking anywhere on our campus we will also be signaling to our medical school community that such practices are contrary to our mission and should be vigorously restricted. We will also pursue further discussions with the hospital leaders to make this a Medical Center

wide policy, although I am cognizant that exceptions may need to be made for selected patients.

It is my hope that this expansion of our official smoking policy will signal to the tobacco industry our nearly universal abhorrence of its practices and our commitment to promoting the health of our community. It is my hope that in the next months to years we will couple this with programs to facilitate exercise and nutrition as well. Given the contribution of life-style and environmental impacts on health, it is important that we do all we can to improve the health of our employees as well as that of the communities we serve.

Stanford University School of Medicine Gets an “A”

I am of course fully aware that there are very strong feelings about grades among our medical students, particularly during their preclinical years. I agree that the avoidance of formal grades has permitted our students to work more collegially and productively as they navigate the preclinical sciences. At the same time, I do have a strong view that evaluations are an important aspect of clinical medicine and that formalizing this process is a topic needing further attention. But that is not the focus of this current commentary. Rather, in case you haven't heard, Stanford University School of Medicine was one of just five medical schools to receive an “A” from the American Medical Student Association in the 2007 PharmaFree Scorecard. This reflects the progress we have made in limiting the presence of marketing and gift giving through the Stanford Industry Interactions Guidelines that we adopted in October 2006 and that can be reviewed at <http://med.stanford.edu/coi/siip/>.

Concerns about the interactions of physicians with the pharmaceutical and device industry have been further heightened by individual and institutional practices – including concerns about the potential inadvertent impact of industry on the Food and Drug Administration (FDA) through the “Prescription Drug User Fee Act” (see Mark McClellan “*Drug Safety Reform at the FDA – Pendulum Swing or Systemic Improvement*” in the *New England Journal of Medicine*, 2007; 356:1700-1702) and the very fact that according to a recent study by Campbell et al that was reported in the *New England Journal of Medicine* (2007; 356:1742-1750), 94% of physicians have some financial involvement with industry – a rather shocking finding.

We are among a small group of schools that are helping to distinguish and differentiate research collaborations with industry (which we wish to support and engage) versus marketing associations with industry – which we seek to avoid. We have much more work to do in this area, but I am pleased that we are playing an important role in stimulating and leading a more enlightened national dialogue on this serious issue. That does deserve an “A.”!

A Major Step Forward for Stem Cell Research in California

On Wednesday, May 16th the California Supreme Court declined to hear an appeal in the litigation that challenged the constitutionality of Proposition 71, The California Stem Cell Research and Cures Act. Coming some 30 months and 14 days after the voters of

California voted to support stem cell research by passing with a considerable majority a \$3 billion bond initiative, this is a major victory for medical science, our citizens and the global community. As you likely know, Proposition 71 established the California Institute for Regenerative Medicine (CIRM), which is responsible for providing the funding to California investigators. But because of litigation, funding was brought to a near standstill until last summer when Governor Arnold Schwarzenegger authorized a \$150 million loan to the CIRM from the state's general fund. Together with an additional \$45 million from 14 individuals and institutions through the purchase of bond anticipation notes (BANs), CIRM was able to award \$158 million for stem cell research this past year. This research is now taking place at non-profit research institutions, medical schools and universities in California. Stanford has done exceedingly well in this competitive funding, having received \$28.9 million for its training grants as well as seed and comprehensive grant proposals.

Having served on the 29 member governing board (the so-called Independent Citizens' Oversight Committee or ICOC) from the inception of the CIRM I, along with my colleagues, have spent countless hours and many days of meetings to develop the policies, procedures and operations of the CIRM. While the negative impact of the litigation was deeply felt by all, the Supreme Court decision now allows us to move to the next round of funding – which will include \$48.5 million in shared laboratories grants and loans and up to \$222 million for major facility construction at universities, medical schools, research hospitals and research institutes in California. More importantly, this legal decision now offers the hope of funding research that will create new knowledge about stem cell biology and regenerative medicine and that will eventually lead to new therapies and treatments.

The timing of the decision is also of critical importance since the ICOC Presidential Search Committee (of which I am a member) is actively seeking the next leader of the CIRM. This decision now makes this position all the more important and exciting. Clearly this is all great news for California and for biomedical research.

While we celebrate the ability to move forward in California – and in other states as they take similar steps – we must recognize that, as important as these state initiatives are in filling in important gaps in research funding, it is equally if not more important to do all we can to strengthen our nation's biomedical research engine, the National Institutes of Health, both generally and more specifically in stem cell research. Unfortunately the latter remains a highly politicized issue and, despite increasing support in the House and Senate, the votes are not sufficient to override a Presidential veto of legislation to permit broader Federal funding in this area. That leaves only two options: first, to continue our advocacy in California and nationally and, second, to exercise our rights through the democratic process – especially in November 2008.

Are Research Universities Organized for Optimizing Interdisciplinary Research?

Some years ago I raised the question of whether the current departmental structure that defines the School of Medicine – as well as virtually all medical schools and universities

– should be re-examined in order to foster more optimal alignments among disciplines and promote interdisciplinary research and education. Part of this discussion emerged from our burgeoning efforts to establish the Stanford Institutes of Medicine, which some faculty leaders then thought – and some continue to think - might threaten or challenge the traditional domain of departments. When I originally raised this issue, many junior faculty and a number of senior faculty were supportive to change – but I think it is safe to say that many department chairs were not and hence I elected to put the matter aside and allow a more evolutionary approach to interdisciplinary research and education unfold. Interestingly, in the April 26th issue of *Nature* (2007; 446:949) an editorial entitled “*The University of the Future*” leads with the statement that “The traditional model of the US research university – based on the pre-eminence of the single-discipline department – needs to be stretched and challenged.” In part this editorial was stimulated by an update of what is referred to as “The Arizona Experiment” – where an effort by Arizona State University President Nicholas Crow is underway to break away from the traditional department-based model and build instead problem-focused interdisciplinary research centers. It is an experiment that has both supporters and detractors – but it will certainly be worth watching, as long as thoughtful metrics are configured to monitor its progress, successes and failures.

At Stanford, interdisciplinary research has been part of the fabric of the University for decades and has largely been accomplished by faculty-initiated efforts. Even Bio-X, now widely known as emblematic of interdisciplinary research, and alluded to in the *Nature* editorial mentioned above, has been faculty driven. Like many others at Stanford, I believe that the intersections between the physical and life sciences are exciting and essential to future discovery based research – as well as to translating discoveries. And while the foundations for these efforts are best left with faculty initiatives and collaborations, I also believe that efforts to further enhance these efforts across the University benefit from institution wide efforts. It is for those reasons that the Stanford Institutes of Medicine were launched.

The Institutes are progressing in various ways and on different time-lines. For example, our efforts in establishing the Stanford Cancer Center (despite its very long latency) are now fostering a new level of institutional interaction and national recognition (see below). Similarly, the Stanford Institute for Stem Cell Biology and Regenerative Medicine has achieved considerable momentum, through the support of the California Institute for Regenerative Medicine, the receipt of numerous philanthropic gifts and a community that has forged numerous education and research collaborations, among other factors. Both of these Stanford Institutes of Medicine are featured as university-wide initiatives in the Stanford Challenge (see http://deansnewsletter.stanford.edu/archive/10_23_06.html#1).

The Neuroscience Institute at Stanford (NIS) represents perhaps the broadest institutional initiative and opportunity since it extends across a number of clinical and basic science departments within the Medical School as well as in the Schools of Humanities & Sciences, Engineering, Law, Business and Education. It also engages the interlinking strategic centers of Genomics, Imaging, and Informatics, and it connects to Stem Cell

Biology and Regenerative Medicine, among others. In addition, NIS raises some of the most important societal challenges of contemporary science– from memory and human consciousness to behavior – as well as delving into the most basic and fundamental issues surrounding neural circuitry and the definitions of both the normal and abnormal workings of neural systems.

For these and other reasons, I was pleased to have the opportunity to address the Annual Retreat of the NIS at Asilomar on May 6-8th. Given the extraordinarily talented faculty at Stanford who are devoted to various aspects and features of neuroscience – and the outstanding students and staff who work with them – the goal of NIS to become among the world’s best (if not the best) university-wide initiative in neuroscience seems both plausible and achievable. While considerable progress has been made I challenged the group to think even more boldly and broadly to identify the most compelling vision possible that will distinguish Stanford Neuroscience from any efforts imagined here to date. Building on our foundations of discovery based fundamental research and extending the boundaries as broadly as possible – including to the communities that surround us – provide unique opportunities. I am excited to know that numerous leaders and members of the NIS have embraced this challenge and are working on ways to meet the Stanford Challenge. I am looking forward to receiving the benefits of their creativity in the months ahead and to sharing them with you. Clearly we are poised for success, and the time is right to bring this vision forth.

Another Affirmation for the Stanford Cancer Center

In the April 23, 2007 Dean’s Newsletter (see:

http://deansnewsletter.stanford.edu/archive/04_23_07.html#2) I announced the wonderful news that we have become an NCI-designated Cancer Center. But we all acknowledge that this important recognition is just one step along the path of becoming one of the nation’s foremost cancer treatment and prevention centers. Our achieving that goal will be based on excellence in basic discovery research together with translational and population science research and excellence in the delivery of patient care. To further validate our progress and better delineate future efforts, the Stanford University Cancer Center (SUCC) External Advisory Board (EAB) conducted a site visit on Monday May 14th. The EAB includes Drs. Ed Benz (Dana Farber Cancer Institute, Harvard), Janelle Baldwin (Fred Hutchinson Cancer Research Center), Elizabeth Blackburn (UCSF), Shelly Earp (Lineberger Comprehensive Cancer Center, UNC), John Glick (Abramson Cancer Center, U Penn), Ed Harlow (Harvard), Ron Herberman (University of Pittsburgh Cancer Institute), Richard Jones (Sidney Kimmel Comprehensive Cancer Center, Johns Hopkins), Joyce Niland (City of Hope Comprehensive Cancer Center), Electra Paskett (James Cancer Hospital and Solove Research Institute, OSU), Louise Strong (MD Anderson Cancer Center) and Marcy Waldinger (University of Michigan Comprehensive Cancer Center).

This is an impressive and highly experienced group of cancer center director leaders and investigators with expertise across the spectrum of basic research, translational discovery

and population sciences. Of interest, a number of these same individuals visited with us several years ago when we were first contemplating making an application for NCI designation. Because I had known many of them from my own past work as an oncologist, they provided me with an informal summary that was, as it turned out, humbling. Specifically, they commented that, while cancer research was enormously strong at Stanford and while we had some areas of excellence in translational research, they questioned whether we would “ever get our act together – based on our prior performance” sufficiently to make a credible application to the NCI for cancer center designation. I have been pleased that, with each passing visit, the skepticism of the EAB has morphed to increasing support.

Now, on the eve of our entry into the cadre of NCI designated Cancer Centers, we have a wonderful portfolio of basic discovery research programs, a rapidly developing number of clinical and translational research projects and, thanks to our partnership with the Northern California Cancer Center (NCCC), a burgeoning program in population sciences. And I am happy to report that the EAB, at their May 14th meeting, was most enthusiastic and impressed with our progress and our future. For that I thank all of the investigators and scientists who have stepped forward to forge new collaborative efforts in cancer research and care. I also thank the leaders and director of the NCCC for their willingness to join with Stanford in this important effort. And, of course, I thank the leaders who have moved our agenda forward, especially Irv Weissman, Bev Mitchell, Steve Leibel and Karl Blume – among many others.

In my mind the evolution of the Stanford Cancer Center is a new model for interaction and collaboration and should serve as such for our other Stanford Institutes of Medicine and Strategic Centers. The more that we can accomplish in areas of coordination, interaction, integration and cross-disciplinary research and patient care, the stronger we will be as an institution to help lead medicine and bioscience research in the 21st Century.

Physician Leadership Program Completes Its Second Year

Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership provided this report.

On Saturday May 19th, the Physician Leadership Program, co-sponsored by the School of Medicine and Stanford Hospital and Clinics, witnessed the graduation of a second group of outstanding leaders. The twenty-six graduating associate professors had completed a yearlong leadership program under the directorship of Dr. Joseph Hopkins, MD, MBA, Clinical Professor of Medicine. A highlight of the program was the faculty-led project that each participant conducted using a team-based approach. Each presentation was a vivid testimony of the talents of our faculty and of their outstanding leadership capabilities. It was delightful and inspiring to see the diversity of work that has been accomplished. One faculty leader commented, “The graduation ceremony reminded me of the ‘magic’ of Stanford. To hear about the wonderful, often groundbreaking work that everyone is doing, in spite of all the challenges we each face in our extremely busy lives, was like drinking champagne: it made me feel effervescent!”

Importantly, each of these faculty members is actively leading changes that will enable us to realize the SoM and Stanford Hospital's vision for excellence. Success in achieving their stated project goals is an inspiring indication of the positive change that can occur with the right leadership. Two faculty leader commented: "What I learned from the course and grew to appreciate was an idea of leadership more rooted in service to others and in navigating through complex systems for the general good." "Early on during the leadership course, I was astonished by the feeling of the group in general of being unable to make any change at Stanford- despite the fact that this group was picked because of their ability to lead. However, during the leadership course, reinforced by the project, where theory became practice, there was an amazing difference in the group's perception of our ability to effect change at Stanford."

In addition to accomplishing change with their individual projects, the graduating faculty leaders uniformly expressed the tremendous value of the program in building community, providing them with new networks, mentoring, and an enhanced feeling of being connected to the institution. Learning from each other, they had acquired a greater understanding of how the institution works, experienced support through shared interest, and appreciated dedicated time to discussing leadership issues with their peers. The overarching theme expressed was the powerful effect of team and collaborative work, consistent with a reframing of "leadership" as organizational capacity in which the emphasis is on developing social capital through relationships. This approach represents an important paradigm shift – instead of thinking of leadership as something that someone does – it is thought of as "something people do together."

Congratulations to all of the graduates of this year's Physician Leadership Program!

The Continuing Challenge of Enhancing Diversity

In the May issue of *Nature Medicine* an editorial entitled "Minority Report" (2007;13:513) concludes "*Minority representation in science will not increase overnight. But the need for diversity at the bench and in the highest echelons of science cannot wait another generation. Investments must be made now to recruit and retain minority scientists so that their representation increases to reflect the importance of diverse voices in scientific research.*" This important challenge is made more daunting by the fact that between 1993-2002 only 2.6% of new PhDs were black and only 3.7% were Hispanic. Improving the diversity of the faculty remains an important goal both for the President and Provost and throughout the university, including the School of Medicine, where Dr. Hannah Valantine, Professor of Medicine, leads our efforts as the Senior Associate Dean for Diversity and Leadership. While progress throughout the University has occurred during the past several years, additional major investments are still needed.

In the recent update of University faculty "gains and losses" presented to the Academic Senate and most recently at the Spring Departments Chairs Workshop, Vice Provost for

Faculty Development Pat Jones noted that the number of women faculty continues to increase, with women comprising 24.3% of the faculty as a whole and, most encouragingly, 43% of the junior faculty hired in the past year. Importantly, female and male faculty earn tenure at similar rates. While faculty of color comprise 18.4% of the faculty, it is discouraging to note that little to no growth has occurred in the recruitment of underrepresented minority faculty - especially of Black and Native American faculty. Clearly recruiting and supporting additional underrepresented minority faculty is an important priority for the School of Medicine as well as for the University. Efforts are underway to provide more assistance to search committees, heighten awareness and foster outreach programs. We have done better with the recruitment of medical and graduate students - but have work to do to make these efforts even more successful. But we also need to be more creative in retaining and developing underrepresented minority students and trainees to join our faculty so that our opportunity to more successfully diversify our faculty can be enriched and enhanced.

Advocacy on Hepatitis Prevention Among Asian Americans Takes Hold

California continues to take the lead on a number of important health initiatives. Among these is the opportunity to reduce or prevent liver cancer among high-risk populations, especially the Asian community, by immunization against Hepatitis B. This effort has been spearheaded by the vision and leadership of Dr. Sam So, Lui Hac Minh Professor and the founder and director of the decade-old Asian Liver Center at Stanford. Most recently Dr. So has aligned with other community organizations as well as with San Francisco Mayor Gavin Newsome to launch the Hep B Free Campaign, which will test and vaccinate all Asian and Pacific Islander American residents for hepatitis B – making San Francisco the first city to carry out such an effort. The goal is to raise both awareness and collaboration among the health care services to help enact this important program – which is made more important by the fact that San Francisco has the highest incidence of liver cancer in the USA, mainly due to unrecognized hepatitis B infection among the Asian and Pacific Islander populations. Indeed, two out of three Asian American San Francisco residents who turned out to be chronically infected with hepatitis B were unaware of the infection. Because infected populations can be monitored more closely for possible liver cancer and since uninfected patients and especially newborns can have infection largely prevented by the hepatitis B vaccine, this campaign has important health benefits. It is a great example of promoting human health and I want to especially acknowledge Dr. Sam So for his key role in making these important programs a reality. Without question, we need many more examples of such advocacy efforts if we are to reduce disease morbidity and the cost of health care in this nation – and around the world.

New Public-Private Partnership to Enhance Emergency Care in India

Thanks to the efforts of Drs. SV Mahadevan, Assistant Professor of Surgery, and his Emergency Medicine colleagues Drs. Matthew Strehlow, Gregory Gilbert, Peter D'Souza and Alice Chao, an agreement was signed on May 9th with the nonprofit group Emergency Management Research Institute (EMRI), based in Hyderabad, India. Under this agreement, paramedics will be trained to provide emergency services in the southern state of Andhra Pradesh, which has a population of 80 million. The ultimate goal is to extend this program through India – whose population is now 1 billion (see:

http://med.stanford.edu/news_releases/2007/may/EMRI.html for additional details). This ambitious project represents a unique public-private partnership that will include education and training programs provided by the Stanford's Emergency Medicine program. It is a wonderful example of Stanford's goal of reaching out to our global community as part of the Stanford Challenge. I am appreciative to Dr. Mahadevan and his colleagues for the leadership and to the collaboration with EMRI and India.

A Wealth of Talents

Within a span of just 10 days our students have given evidence of their vast array of talents across a spectrum ranging from the arts to the sciences and the community beyond. On May 7th, the annual Medicine and the Muse featured presentations, readings from forthcoming books and essays, visual commentaries, and instrumental and voice musical celebrations by medical and graduate students. Various displays and posters accompanied the students' presentations. The program also included a keynote address by Dr. Samuel Shem, Professor of Psychiatry at Harvard Medical School and author of "The House of God" and "Mount Misery." Medicine and the Muse was an amazing display of virtuosity and talent that helped humanize and provide an emotional and artistic voice to the many dimensions of human biology, medicine and disease.

Balancing this artistic talent was a wide range of scientific accomplishments displayed on May 16th at the 24th Annual Stanford Medical Student Research Symposium. Some 48 poster presentations were provided that ranged in content from basic science studies to clinical and translational research projects. I was pleased to review a number of these projects and witness the depth and excellence of our students' research efforts – and the guidance and mentoring they were receiving from colleagues and faculty members.

In addition, a number of our students presented their work from a variety of community service projects undertaken as an extension of their efforts in the Practice of Medicine course. This exhibit further complemented the repertoire of talents and experiences that were on display – representing the spectrum from basic discovery to clinical, translational and population science research to community service to arts and the humanities. Pretty amazing.

Some Notable Events

Goodman Simulation Center and the Learning and Knowledge Center: On Wednesday, May 9th Dr. Paul Berg, Robert W. and Vivian K. Cahill Professor Emeritus, hosted an event featuring the new Goodman Simulation Center and the upcoming Learning and Knowledge Center. Thanks to the vision and dedication of Dr. Tom Krummel, Emile Holman Professor and Chair of Surgery, and the wonderful support of the Goodman family, the Stanford Hospital & Clinics based Center for Simulation was officially opened in November 2006 (see:

http://deansnewsletter.stanford.edu/archive/11_20_06.html#6). Guests had the opportunity to visit the Goodman Center and to also learn about the rapidly developing

plans for the LKC (see <http://lkc.stanford.edu/>). In addition to housing the Center for Simulation and Immersive Learning, the LKC will foster both advanced technical learning and skill acquisition along with state-of-the-art classrooms, a conference center, executive meeting rooms, and student center, as well as a café and a bookstore. Work has already commenced on the infrastructure and site preparation of the LKC, and we hope to have ground breaking in February 2008 with project completion in late 2009 or early 2010. These are very exciting developments - the LKC and related projects will be transformative for the School of Medicine and Medical Center.

Fight for Memory: Stanford's Alzheimer Disease: On May 16th a special luncheon was hosted by Michael and Emily Goldberg and Rick and Paula Murdock to feature the efforts underway at Stanford to develop a Center for Alzheimer Disease. The current impact of dementia on the population is already seriously felt and is destined to get significantly worse with the aging population. At this very well attended event. Dr. Frank Longo, George E. and Lucy Becker Professor, described some of his own research in developing new potential approaches to the treatment of Alzheimer disease and dementias as well as the broad University-wide commitment to working collaboratively under the broad umbrella of the Neuroscience Institute at Stanford. As noted above, neuroscience is one of our highest priorities in the School and University. One of the most important challenges and opportunities before us is the development of better tools for the diagnosis, treatment and prevention of dementias – built on a deeper and more fundamental understanding of the mechanisms causing these serious disorders.

Awards and Honors

- **Dr. Stan Falkow**, Robert W. and Vivian K. Cahill Professor, received the wonderful news this week that he was elected to become a Foreign Member of the Royal Society of London for Improving Natural Knowledge (see also: <http://www.royalsoc.ac.uk/page.asp?tip=1&id=6628>). This is a most prestigious honor and another recognition of a remarkably successful career. Please join me in congratulating Dr. Falkow.
- **Dr. Ron Garcia**, Assistant Dean for Minority Affairs, and **Dr. Fernando Mendoza**, Professor of Pediatrics and Associate Dean of Minority Advising and Programs, were nominated and selected as two of the 100 Most Influential Latinos in Silicon Valley. Their biographies and pictures will be published in the San Jose Magazine July issue. Please join me in congratulating Dr. Garcia and Dr. Mendoza.
- **Dr. Richard Tsien**, George B. Smith Professor of Molecular and Cellular Physiology, has been named recipient of the Gill Prize given by the Linda and Jack Gill Center for Biomolecular Science at Indiana University for outstanding contributions to his field. Please join me in congratulating Dick for his extremely important and continuing scientific contributions and for his terrific citizenship in support of our community!

- The **Office of Communication & Public Affairs** has been notified by the Council for Advancement and Support of Education (CASE) that they have won an impressive variety of honors for their publications:
 - Gold medal - News releases covering research, medicine and science
 - Silver medal - Staff writing for "Medical Center Report"
 - Silver medal - "Stanford Medicine" in the category of special-interest magazines
 - Silver medal - Overall visual design of "Stanford Medicine"
 - Bronze medal - Illustration that accompanied the story titled, "The Oasis" (Stanford Medicine, Spring 2006).
- Congratulations to Paul Costello and his team!

Appointments and Promotions

- ***Rajni Agarwal-Hashmi*** has been reappointed to Assistant Professor of Pediatrics (Stem Cell Transplantation) at the Lucile Salter Packard Children's Hospital, effective 5/01/07.
- ***Sandip Biswal*** has been reappointed to Assistant Professor of Radiology, effective 5/01/07.
- ***Maxwell Boakye*** has been reappointed to Assistant Professor of Neurosurgery at the Veterans Affairs Palo Alto Health Care System, effective 5/01/07.
- ***Kiki Chang*** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences, effective 5/01/07.
- ***Benjamin I. Chung*** has been appointed to Assistant Professor of Urology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 6/01/07.
- ***Edward J. Damrose*** has been reappointed to Assistant Professor of Otolaryngology – Head and Neck Surgery, effective 5/01/07.
- ***Cornelia L. Dekker*** has been promoted to Professor (Research) of Pediatrics (Infectious Diseases), effective 5/01/07.
- ***Magali Fontaine*** has been reappointed to Assistant Professor of Pathology effective 5/01/07.
- ***Paul C. Grimm*** has been appointed to Professor of Pediatrics (Nephrology) at the Lucile Salter Packard Children's Hospital, effective 5/01/07.
- ***Keith N. Humphreys*** has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/01/07.

- **Neeraja Kambham** has been reappointed to Assistant Professor of Pathology, effective 5/01/07.
- **Karen J. Parker** has been appointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/01/07.
- **Gavin Sherlock** has been reappointed to Assistant Professor (Research) of Genetics, effective 4/01/07.
- **Aaron Straight** has been reappointed to Assistant Professor of Biochemistry, effective 6/01/07.
- **Edith V. Sullivan** has been reappointed to Professor (Research) Psychiatry and Behavioral Sciences, effective 6/01/07.
- **Hannes O. Vogel** has been promoted to Professor of Pathology and of Pediatrics (Medical Genetics) and, by courtesy, of Neurosurgery, effective 5/01/07.
- **Christine A.C. Wijman** has been promoted to Associate Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, effective 5/01/07.

Dean's Newsletter

June 4, 2007

Commencement 2007 Will Be June 16-17

June 16-17th is Commencement Weekend, and I invite all medical school faculty to participate in the School of Medicine Convocation Ceremony, which will begin at 1:30 pm on Saturday, June 16th. I hope as many faculty who are able to participate will join us in this wonderfully festive occasion, during which we will honor 30 recipients of the Master of Science Degree, 89 recipients of the Doctor of Philosophy Degree and 76 recipients of the Doctor of Medicine Degree – with a number of the graduates receiving more than one degree. Please let Ms. Zera Murphy (Zera.Murphy@Stanford.edu) know if you plan to participate.

Dr. Herbert L. Abrams, Professor of Radiology, Emeritus, will give this year's Commencement Address to Medical School Graduates. In addition to his enormously distinguished career as a pioneer and leader in cardiovascular radiology, Dr. Abrams is a world-renowned leader in nuclear proliferation and founding vice-president of the International Physicians for Prevention of Nuclear War as well as a 1985 recipient of the Nobel Peace Prize.

Among the great traditions of the medical school commencement are the addresses to graduates by members of the graduating class. This year Joe Dam Dunn will speak on

behalf of the PhD graduates and Joshua Spanogle will speak for the graduating class in Medicine.

On Sunday, June 17th the University Commencement will take place in the Stanford Stadium at 9:30 am to 12:30 pm. This year's University Commencement Speaker is Dana Gioia, Stanford alumnus and renowned poet, literary critic and chairman of the National Endowment for the Arts. I welcome as many of our faculty and students to participate in this event as well.

I look forward to welcoming our graduates, along with their families and friends, on June 16-17 and hope to see as many faculty members as possible as well.

Bioscience Programs Garner Outstanding Candidates

Renewal is one of the remarkably wonderful things about universities. Just as we prepare to confer degrees on distinguished students who will graduate in two weeks, we are also pleased and honored to welcome students who will be joining Stanford in late summer to begin their graduate school education. Based on the information I received from Dr. Ellen FitzSimmons Porzig, Associate Dean for Graduate Education, the 12 departmental and interdisciplinary programs offering PhD degrees received 1365 applications, of which 278 were offered interviews. Ultimately, 180 students were admitted, of whom 101 will be matriculating in bioscience programs in the Schools of Medicine and Humanities and Sciences – with the second highest yield on record. In addition to having a record of excellence and future promise, 16 of the entering students are also members of under-represented minorities and an additional two students are under-represented in science at Stanford. We remain committed first and foremost to admitting the very best students possible – but we are also committed to having as diversified a student body as possible, and I am grateful to the efforts of our faculty, students and members of the Dean's Office in attracting such wonderful individuals to Stanford.

In addition, 373 students applied to the joint School of Engineering and Medicine Bioengineering Department (335 for the PhD program and 38 for a MS degree). Of the PhD applicants, 42 were interviewed and 31 were extended offers, of whom 17 accepted and will matriculate in 2007. This is the fourth year of admissions to the still new Bioengineering Department and although its history is short, the consensus is that each year the quality of the applicants and admitted students continues to get better and better – a comment that can be offered about virtually all Stanford programs.

Without question the lifeblood of a university is the quality and commitment of its students. I am very pleased with the selection of the graduate student class entering in 2007 and grateful to the faculty and the students who make Stanford such a wonderful environment in which to work, learn and contribute new knowledge.

Why Do We Need Free Clinics?

I wish we did not need free clinics as they are currently constituted. But I am proud of and thankful to our medical and undergraduate students, faculty and community physicians volunteers for all they do to serve patients coming to the Cardinal Free Clinics – including the Arbor Free Clinic and the Pacific Free Clinic. On Wednesday evening, May 30th, we had the opportunity to thank and acknowledge the contributions of all of these volunteers in a celebratory dinner at the Arrillaga Alumni Center. Special thanks to the 2007-08 Managers (Asya Agulnik, Marissa Aillaud, Tiffany Castillo and Pearl Chang) and to Drs. Rex Chiu, Medical Director of Pacific Free Clinic, and to Lars Osterberg and Ian Tong, Co-Medical Directors of Arbor Free Clinic, for their tremendous efforts and commitment during the past year(s).

There can be no question that “free clinics” are a consequence of as well as a response to the lack of a health care system in the United States. With over forty million uninsured and many more minimally insured Americans, access to health care is limited to emergency facilities or to no health care at all. While free clinics are not an answer to the health care needs of the uninsured, they provide an important safety net for our community by providing health assessments and offering access to at least some individuals in need. Sadly, the need for free clinic services may grow even more as the state of California and various counties cut back on mental health and preventive medicine services over the next year!

Free clinics offer an opportunity for our students to minister to underserved individuals, make a patient-provider connection that is not driven by market forces or money, and learn from exceptional community physician and faculty role models – and from each other. In addition, this important volunteer work enables students to better appreciate the serious deficiencies of our current health care (non)-system and to become better-informed advocates for change. I sincerely hope that the rising national (and state-wide) dialogue on addressing healthcare in the United States will be met by real changes in the years ahead. If that occurs the need for free clinics may well disappear – but the lessons learned in the art and professionalism of medicine will be sustaining and important to current and future generations of students and physicians.

Stanford Digestive Disease Center and the Symposium on Hepatitis C

The Stanford Digestive Disease Center (DDC), with the co-sponsorship of the Immunity, Transplantation and Infection Institute, will hold its Third Annual Symposium on June 8, 2007, 8:30 am to 4:30 pm in the Clark Center auditorium. The event, focused on “The Virology and Treatment of Hepatitis C,” features experts from outside and inside Stanford, including: John McHutchison (Duke University), Stanley Lemon (University of Texas Medical Branch at Galveston), Christopher Walker (Ohio State University), Michael Houghton (Epiphany Biosciences Inc.), and from Stanford: Mark Kay, Carlos Esquivel, Steven Fount, Shoshana Levy, Xiaosong He and Jeffrey Glenn, DDC Symposium Director. Harry Greenberg, DDC Director and Senior Associate Dean for

Research and Training, will open the Symposium with welcome remarks and an overview of the Center. You are welcome and invited to attend the symposium.

The DDC is a 5-year NIH multi-disciplinary program grant. It has 46 Research Base Investigators and Associate Members from 10 departments: nine from the School of Medicine and one from Engineering. It also supports a variety of core functions. The DDC's scientific Cores include the FACS/Immunoprobe (Director, Eugene Butcher of Pathology; Associate Director, Bishr Omary of Medicine/Gastroenterology and Hepatology), Cell Imaging (Director, Stan Falkow of Microbiology and Immunology; Associate Director, Anson Lowe of Medicine/Gastroenterology and Hepatology), Proteomics/Genomics (Director, David Relman of Medicine/Infectious Diseases; Associate Director, Bill Robinson of Medicine/Rheumatology and Immunology), Animal Imaging and Tissue Histology (Director, Chris Contag of Pediatrics/Neonatology; Associate Director, Allen Cooper of Medicine/Gastroenterology and Hepatology).

Focusing on Early Diagnosis of Cancer

Even with sophisticated imaging and other diagnostic technologies, cancer is diagnosed today only when many millions to trillions of malignant cells have populated a solid lesion or invaded tissues like the bone marrow. Early detection, diagnosis and intervention could play a critically important role in improving the outcome of cancer. But while the technologies are evolving, they are not available today. Accordingly, the recently announced collaboration between the Canary Foundation, the Stanford Cancer Center and the Department of Radiology to establish a Center of Excellence for Cancer Early Detection is important and exciting. On Tuesday evening, May 22nd, Mr. Don Listwin, founder of the Canary Foundation, announced a \$7.5 million gift to this new center, of which \$4 million will support the center; the remaining will support the research of individual faculty (see also: <http://news-service.stanford.edu/news/2007/may30/med-canary-053007.html>). Of particular note, the Department of Radiology, led by Dr. Gary Glazer, has pledged a \$4 million match that will further enhance the research efforts, which will focus initially in genomic medicine and molecular imaging. This is an exciting collaboration that utilizes the strengths of Stanford faculty in innovation and technology development, which are highly relevant to our burgeoning efforts in cancer diagnosis, treatment and prevention.

Interest in Stem Cell Biology and Regenerative Medicine Continues to Grow

On Wednesday, May 30th the Stanford University Medical Center hosted a program entitled "Harnessing the Power of Stem Cells: A New Medical Frontier" that was attended by over 200 members of the community. There is no question that stem cell biology and regenerative medicine are now regarded as one of the most exciting – and controversial – areas of biomedical research. Stanford has been in the forefront of this effort and has made great strides since the formation of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, which is led by Dr. Irv Weissman, Virginia and

DK Ludwig Professor. It is particularly exciting to witness the number of outstanding Stanford faculty who are engaged in stem cell research across a broad array of biological processes and disease states – a number of whom spoke at this highly successful event. In addition to the keynote address by Dr. Weissman, some of the most challenging and exciting areas of investigation were presented by a highly diversified and outstanding faculty group from across the university, including:

- **Embryonic Stem Cells:** *Hank Greely*, Deane F and Kate Edelman Johnson Professor of Law and *Renee Pera*, Professor of Obstetrics and Gynecology
- **Cancer:** *Mike Clarke*, Karel H and Avice N. Beekhuis Professor in Cancer Biology and *Steve Quake*, Professor of Bioengineering
- **Autoimmunity:** *Seung Kim*, Associate Professor of Developmental Biology and *Judy Shizuru*, Associate Professor of Medicine
- **Tissue Regeneration:** *Mike Longaker*, Deane P and Louise Mitchell Professor in Plastic and Reconstructive Surgery
- **Heart Disease:** *Bobby Robbins*, Professor and Chair of Cardiothoracic Surgery and Director of the Stanford Cardiovascular Institute and *Joe Wu*, Assistant Professor of Radiology and of Medicine
- **Neurological Diseases:** *Theo Palmer*, Associate Professor Neurosurgery and *Gary Steinberg*, Bernard and Ronni Lacroute-William Randolph Hearst Professor and Chair of Neurosurgery and Neurosciences

Particularly exciting is the fact that more than half of these faculty have joined Stanford since the Stem Cell and Regenerative Medicine Institute efforts began in earnest. Equally important are the breadth of scholarship and the inclusion of interdisciplinary skills and backgrounds that forge new opportunities for discovery and that, in time, will translate those discoveries to improvements in the lives of adults and children. It is also important to note that this group is only a small portion of the Stanford faculty now studying stem cell biology – many of whom now benefit from the funds being provided by the California Institute of Regenerative Medicine. We can look forward to the enhancement and enrichment of those efforts in the years ahead. And while we must be careful not to over promise as to when discoveries will impact human disease I am confident that this will happen and that Stanford will be a leader in transforming this important new field of medicine and science.

Violence, Injury and Death Among the Young

While a great part of our attention and focus in academic medical centers is devoted to the diagnosis, treatment and prevention of disease – and to better understanding fundamental biological processes – the major causes of death among teenagers are accidents, injuries and violence, including suicide. This was well illustrated in the May

23rd presentation by Dr. Edward Cornwell, Associate Professor of Anesthesiology and Critical Care Medicine and Director of the Adult Trauma Service at Johns Hopkins on “A Trauma Surgeon’s Perspective on Youth Violence”. In his inspiring presentation and his responses to “5 Questions” (see: <http://news-service.stanford.edu/news/2007/may16/med-cornwell-051607.html>) Dr. Cornwell described how his experiences as a trauma surgeon prompted him to develop community programs in Baltimore in an attempt to help engage teenagers and young adults to reduce gang and community violence. One must admire and praise such a dedicated physician who is willing to go beyond the traditional borders of the medical center to help educate, inform and hopefully motivate vulnerable youth to amend their life styles and escape from the “culture of violence.”

While such efforts are important, I cannot help but express concern that their impact will be overshadowed by some of the societal issues that promote violence and by the ready availability and ease of acquiring guns. This was all too sadly illustrated in the horrible shootings that recently occurred at Virginia Tech, but they occur on different scales and with less notice virtually every day in the streets of cities around this nation. Sadly, better gun control, which would almost certainly impact on some of this violence, remains beyond the political and, dare I say moral, will of this nation. And yet, if effective gun control policies were established and implemented it is most likely that Dr. Cornwell’s efforts would be made simpler – and that violent deaths due to gunshot injuries would decline.

To a not insignificant degree we are increasingly immune to violence, since it comes across our TV each day in the inflicted deaths that occur in global communities – or in the wars between and within nations. So important is this matter that the next issue of Stanford Medicine will be devoted to the topic of “War” – and will be available later this month.

Medical Faculty Prominent as University Faculty Award Honorees

Faculty excellence is measured in many ways, among which are major awards and honors. And what makes Stanford so great is the quality of its faculty and students. Each year the President and Provost honor major award recipients and newly elected members of national academies. This year 121 faculty members from across the university were so honored – ranging from Nobel Prizes and major professional or society honors to election to distinguished honorary societies and academies. We should all be proud to be members of such an outstanding community of scholarship and excellence. I am also proud to note that 50 of these 121 awards were among faculty in the School of Medicine – many of whom I mentioned in prior Dean’s Newsletters. Congratulations to all.

Upcoming Events

Once again the very popular Outdoor Summer Science Talks are being scheduled at the Cantor Arts Museum. Everyone is invited to attend these informative sessions, which are free and open to the public.

Outdoor Science Talk 1 - Thursday, June 28th, 7pm

Regenerative Medicine: What Is It? Where Do We Stand? Where Are We Going?
with Dr. Michael T. Longaker.

Outdoor Science Talk 2 – Thursday, July 12th, 7pm

Recent Advances in Heart Surgery with Dr. Robert Robbins.

Outdoor Science Talk 3 – Thursday, July 26, 7pm

Cool Hands, Better Performance with Professor H. Craig Heller.

Outdoor Science Talk 4 – Thursday, August, 9th, 7pm

Drugs: One Size Does Not Fit All with Dr. Russ Altman

Awards and Honors

Dr. Sarah S. Donaldson, Catherine and Howard Avery Professor and Associate Chair and Residency Program Director for the Department of Radiation Oncology, has just received the Gold Medal from the American College of Radiology. Prior recipients include Marie Curie, as well as former Stanford faculty Robert Reid Newell, Henry Kaplan, and Malcolm Bagshaw. Congratulations, Dr. Donaldson.

Dr. William J. Maloney, Elsbach-Richards Professor in Surgery just been elected to serve as President of the HIP Society starting in 2009. Congratulations, Dr. Maloney.

Dr. Raymond L. Hintz, Department of Pediatrics Professor Emeritus, has been awarded The Human Growth Foundation 2007 Lifetime Achievement Award for his outstanding contributions to the field of pediatric endocrinology and growth. The Human Growth Foundation is a non-profit organization, composed of patients, families, and medical professionals, whose mission is to help individuals with disorders of growth and growth hormone through research, education, support, and advocacy. Congratulations, Dr. Hintz.

Richard W. Tsien, George D. Smith Professor of Molecular and Cellular Physiology at Stanford, has just received the 2007 Gill Award at the annual meeting of the Linda and Jack Gill Center for Biomolecular Science at Indiana University Bloomington, in honor of his career-long contributions to the field of neuroscience.

Appointments and Promotions

- **Penny Gardner** has been promoted to Adjunct Clinical Associate Professor of Pediatrics, effective 5/1/07.
- **Theodore A. Jardetsky** has been appointed to Professor of Structural Biology, effective 6/01/07.

- **John K. Salisbury** has been reappointed to Professor (Research) of Computer Science and Surgery, effective 9/01/07.
- **Carla Shatz** has been appointed to Professor of Biological Sciences and of Neurobiology, effective 6/01/07.

Dean's Newsletter

June 18, 2007

Commemorating Commencement 2007

The year since our last Commencement in 2006 has been a highly memorable one for the Stanford University School of Medicine. It witnessed the remarkable excellence of our faculty with two Nobel Prizes along with more than 50 other major honors, awards and distinctions. It was a time of continued progress in the fulfillment of ***Translating Discoveries***, and included the significant milestone of being named an NCI-Designated Cancer Center. It was a time of compelling basic science discoveries as well as of notable achievements in clinical research and innovations in patient-care. During this past year we recruited numerous extraordinary faculty and leaders and admitted a class of exceptional graduate and medical students who will be joining the Stanford community in late summer. But to the purpose of the moment, on June 16th we celebrated our 2007 Commencement and graduated a class of highly talented individuals who will join the ranks of our bioscience and medical communities. They emerge with extraordinary promise but face significant challenges due to the worrisome climate now casting shadows over the nation's support for biomedical research as well as the continued deterioration of our "healthcare system." It is our obligation to do all we can to foster their future careers and help create the opportunities for their continued success. But it is also my hope – and should be our expectation – that these new graduates will continue the tradition of Stanford by becoming leaders who will transform medicine, science and our society. They are our source of hope and promise and we are proud to celebrate their achievements to date – and to anticipate their contributions for tomorrow.

Reflections – Representing PhD and MD Graduating Students

Joe Dan Dunn, Candidate for Doctor of Philosophy

Graduation. Graduation is what brings us together today. Graduation, that blessed arrangement, that dream within a dream...

At this ceremony marking the end of my formal education, I will tell a story about the beginning. On a warm August day in Texas in the -- let's say -- early 80's, my father

drove me to my first ever day of school. During the drive he explained that I would go to school for only half a day; I would have class in the mornings until Christmas break and then would switch to afternoons for the remainder of the school year. Upon hearing this information, my eyes grew wide, and I exclaimed in dismay, “Christmas? I have to go to school until Christmas?”

Of course, at the time I had no idea that I would be in school not only until that Christmas but also for many, many Christmases to come. My classmates and I chose the long road. Earning a PhD is no quick and easy task but rather an arduous, sometimes lengthy, sometimes very, very lengthy journey. And let us not forget that science can be a particularly harsh teacher.

Why do we do it? Is it for the prestige? The snazzy lab coats? The freedom to work long hours for low pay? The wary, frightened, and rarely respectful glances from the undergrads? No. We do it because, as Antoine de Saint Exupery wrote in *The Little Prince*, “When a mystery is too overpowering, one dare not disobey.” We do it for the thrill of discovery and for the chance to expand the boundaries of human knowledge – even if, admittedly, we only push the boundary back a few millimeters at a time.

And why does it take so long? Is it because *The Onion* consistently publishes such hilarious and distracting articles? No. Borrowing again from *The Little Prince*, it is because, “Straight ahead of him, no one can go very far.” The road to a PhD is often filled with unexpected twists and turns. Indeed, these surprises are what make science so darned interesting. For some of us, an analogy can be drawn between our graduate careers and the plot of the classic Cohen brothers film *The Big Lebowski*: after a series of perplexing and seemingly random observations, we manage to sort through all the strands of data in our heads to solve the puzzles set before us as thesis projects. Of course, our solutions often raise more questions than answers, but hey, we’ve got to save something for future graduate students.

For others of us, our graduate careers are more like the experiences of the protagonists of *Harold and Kumar Go to White Castle*: after a series of mishaps and zany adventures that force us to grow as scientists, we finally reach our goal and earn the degree.

And for all of us, at times it no doubt seemed like we were trapped in an episode of the Teletubbies: upon hearing us present beautiful data from that perfect experiment our advisors would say, “again.”

Regardless of how we reached our goals, the fact remains that my classmates and I have all been deemed worthy of the degrees we sought to obtain. So congratulations to all that are graduating today. And, on behalf of my classmates, I would to thank our advisors, mentors, colleagues, friends, and family for their support over the years... sometimes many years... sometimes many, many years.

In the midst of this celebratory moment I pose a challenge to my fellow graduates: whether you continue to do research, whether you continue to practice medicine, whether

you decide to enter a new field, do what you can to promote science education. A strong science curriculum inspires and prepares the next generation of scientists. Moreover, a solid science education is also critical for the next generation of non-scientists so we can avoid a future in which public health and environmental policy decisions are based on ideologies and political agendas rather than scientific data. I urge you: please, do what you can to defend science.

Graduation is a crossroads of journeys that signifies both an end and a beginning. And so I will close with the following poem from *The Lord of the Rings*:

The Road Goes Ever On and On
*Down from the door where it began.
Now far ahead the Road has gone,
And I must follow, if I can,
Pursuing it with eager feet,
Until it joins some larger way
Where many paths and errands meet.
And whither then? I cannot say*

Joshua Spanogle, Candidate for Doctor of Medicine

Man, what a difference four years to twelve years makes.

I think back to the beginning of school—two weeks into classes and already we magnets for medical questions. Family and friends treating us like we’d been in practice since the Eisenhower administration. The questions about glucosamine and beta blockers, the question about what to do when Zoe got a FruitLoop stuck up her nose. And, my personal favorite: the frantic call from my mother. “Josh, the dog just ate a bug and his head is the size of a basketball.” We fumbled through answers and explanations, we quickly learned that “I don’t know” doesn’t wash with anyone claiming blood ties or history with us. And so we—some of the best and brightest students in medicine—did what any reasonable person would do in such circumstances—we went to Google. Now, years of medical education under our belts, we field more questions about arthritis, high blood pressure, allergic dogs. But this time, we answer right then and there. We are faster, we are smarter. But most importantly, our Google searches are better. And we know about Up-To-Date (folks: don’t ask your kids about Up-To-Date; just assume they’re really, really smart).

But I’m not here to sing the praises of Internet search skills, or even our basic medical training. What I want to talk about is engagement, and I don’t mean the kind that ends with inappropriate speeches by the best man. I’m talking about physician engagement with issues beyond the OR or the clinic. And the reason I want to talk about this is that I believe we’re at an historic moment when it comes to health care in the U.S.

Let me set the stage. 47 million uninsured. Health care spending of over 2 trillion bucks last year, \$6700 for every person in this country. It's expected to be about \$4 trillion by 2015. (To put this in perspective, if you put 4 trillion on a scale, it would weigh more than the sun. Just kidding, but it's a lot of money). On the research side, NIH funding peaked in 2003 and, despite producing some spectacular results, funding has declined (in real dollars) since then. I don't need to tell anyone involved in the hunt for grants that these are, indeed, lean times.

In summary, the health of health care in this country is not what it should be.

Let me set another stage as an example: in the first 100 years of this country 4.6% of members of Congress were physicians. In the past 40 years, 1.1% were.

So, why all the wonky numbers in a graduation speech? For me, it comes down to this: at a time when health care is becoming the largest single chunk of our economy, when it has its fingers deep into the lives of every person here, when the political climate—for the first time in almost 15 years—is truly recognizing the importance of the issue...At this time, physician participation in these immense forces that shape the country's fate—and especially our fate as doctors—is at an historic low.

But why? Why the lack of doctors in public life? People much smarter than I have come up with answers, ranging from the narrow focus of physician education to the demands of daily practice, which don't allow doctors to explore other career options while still caring for patients. The gist of it is that physicians can't focus on anything but either practice and/or research because there aren't enough hours in the day. This, I think, is a problem, not only because it's somewhat disingenuous—there is research that says development of expertise in two disciplines enhances performance in each—but because it deprives society of the unique perspective physicians can provide.

So, am I saying that all of us should chuck our training and run for that open seat in the 9th District? Hardly. However, I am saying that physicians—for themselves and for society—should be more involved in the larger debate, which sorely needs the doctor's voice right now. And the ways in which we can speak up are myriad: through elected politics and policy work, sure, but it can also be through letters-to-the-editor, it can be through business, it can be through art. It can even, God forbid, be through fiction. The important thing is to engage.

And this is the point at which we come full circle: back from the travails of national policy to the Stanford campus, June 16th, 2007. I might be biased, but Stanford Med is doing a better job than any other school in the country to prepare its students for "Engagement with Medicine"—Capital "E", capital "M"—which comes down to a lot more than providing us access to Up-To-Date. Not only has Stanford given us an unparalleled medical education—that goes without saying—it has also allowed us the flexibility to wrangle with the world outside the hospital. And it has supported that endeavor with cold hard cash—a little over \$2 million in student research funds last year alone. These were grants for work in the lab, for work in public policy, epidemiology,

the arts. These were grants for papers that had titles ranging from “Formation, Malformation and Transformation: My Experience as Medical Student and Patient” to “Ensemble molecular dynamics yields sub millisecond kinetics and intermediates of membrane fusion.” Stanford truly has provided fertile ground for scientists, policy experts, advocates, writers and entrepreneurs. From the top down, this medical school recognizes the importance of the physician’s role in society. It recognizes the importance of engagement. This is not trivial. Especially now.

So what are we supposed to do with all this? What do we do with a stellar medical education that pays attention to the “big picture?” Here, I will only speak for myself. Just as I hope to carry my medical education with me for the rest of my life, I hope I will continue to carry the Stanford ethos. In short, I hope I never stop being a Stanford student, though I admit not paying tuition will be a very, very welcome change.

In the end, there is a lot of thanks to go around today. Thanks to the faculty and administration for the dynamic and supportive environment they’ve created. Thanks to my classmates, who’ve already been so engaged and challenging. Thanks to the parents and families, who’ve sweated and sacrificed so we could trudge through fluorescent-lit hospital corridors while the California sun shone outside. And, finally, I trust, someday society will thank Stanford Medical School for the forward-thinking, paradigm-busting physician leaders who get their wings today.

Oh, and one final thing, for the families here. Don’t let all the paradigm-busting, forward-thinking, physician-engagement talk fool you. Even if your kid finds herself cooling her heels in a Senate office someday, she will always—always—have time to take a look at that rash that’s been giving you such trouble lately.

Commencement Speaker: Professor Herb Abrams

Dr. Herb Abrams is Emeritus Professor of Radiology at Stanford, where he has also served as a member-in-residence at the Center for International Security and Cooperation. A world-renowned authority in diagnostic radiology with major leadership positions at Stanford and Harvard, Dr. Abrams has also been a leading figure in issues surrounding the human frailties controlling nuclear arms, the impact of ionizing radiation and nuclear weapons, and the impact of purposeful as well as inadvertent decisions made around nuclear proliferation and war.

In addition to his numerous scholarly articles on diagnostic and particularly cardiovascular radiology, Dr. Abrams was the founding vice-president of International Physicians for the Prevention of Nuclear War, which received the 1985 Nobel Peace Prize. He has received numerous honors for his academic and public policy contributions and I am pleased to welcome him to address you today.

Fourth Dimension of Biomedicine

It's a pleasure and an honor to share some thoughts with the extraordinary women and men this convocation. Yesterday, you were medical and graduate students, and tomorrow you will join the transplanetary society of physicians and biomedical scientists whose lives of service and intellectual engagement have absolutely no bounds. I congratulate you, together with your assembled families, friends and faculty, and welcome you to this unique sisterhood and brotherhood.

I've been asked to say a few words about my career and my involvement in diagnostic imaging and the greater world outside. In brief, I went to medical school to become a psychiatrist; discovered the excitement of internal medicine at the end of my second year; and began to understand in my third year that radiology was the quintessence of diagnostic medicine. Whether it was the brain, the heart, the lungs, or the skeletal system, radiologic imaging provided the road map for virtually all surgical and many medical therapies. After a few post-graduate years in internal medicine, I came to Stanford in 1948 for residency training in radiology. I remained on the faculty, and with the move of the medical school from San Francisco to Palo Alto in 1959, I became professor and director of the diagnostic radiology division. In 1967, I accepted the challenge of developing radiology further at Harvard Medical School as Chairman of the medical school department, with day-to-day operational responsibility for radiology at the Brigham and Women's and Dana-Farber hospitals. I returned to Stanford in 1985, eighteen years later.

Throughout this period, my laboratory and clinical research focused on cardiovascular pathophysiology and imaging. That was the centerpiece of my work in the three dimensions of medicine: patient care, research and teaching. I had the pleasure of doing the first selective coronary arteriogram at Stanford in 1960, and, with Ricketts, of designing and describing in the JAMA the first percutaneous transfemoral pre-shaped catheter method, the basis of modern coronary arteriography.

We're all aware of the breadth and import of those three dimensions, but what in the world is the "fourth dimension," my topic for today? The answer to that question will become clear as I reflect on my involvement in two physician movements during the last century.

Earlier this year, on the weekend of February 23, 2007, I had the opportunity to meet with some of the next generation of leaders in one of those movements, when Stanford was host to the annual national meeting of Students Physicians for Social Responsibility. I was privileged to address and then to listen to 100 bright, energetic and informed attendees from medical schools across the nation present an impressive set of papers on nuclear issues, the environment, and violence prevention at many levels. It was like a shot of adrenaline.

For many years I had served on the National Board of "PSR", as Physicians for Social Responsibility is referred to. It began as an effort by a small number of physicians in late

1961 to “study the dilemma in which the world now finds itself.” This concern was expressed in a series of articles in the New England Journal of Medicine on the human and ecologic effects of a nuclear attack, and the physician’s role in the post-attack period.

PSR, with other groups, was active in demanding a ban on nuclear testing, collecting hundreds of baby teeth and demonstrating that they contained Strontium 90. Together with worried parents, they took the teeth to Washington. As the clamor about the hazards of fallout around the globe grew louder, an atmospheric test ban was proposed and signed on August 5, 1963.

Towards the end of the seventies, PSR was galvanized once more by the heightening alarm over nuclear weapons stockpiles and the tension of the Cold War. After a series of symposia held around the country on college campuses, including Stanford, its membership increased rapidly and many new chapters were formed.

In the summer of 1979, a few of us in PSR joined together to discuss an international organization to form a bridge between the East and West. The goal would be to inform and educate physicians, the public, and policy makers in many nations on the life and health impact of nuclear war. International Physicians for the Prevention of Nuclear War, known as IPPNW, was formally incorporated in the spring of 1980. In March 1981, the first international congress was held, with about seventy participants from the United States, the Soviet Union, Japan, Canada, France, the United Kingdom, Norway, Sweden, and the Netherlands. An appeal to the United Nations and to the heads of all governments emerged from the meeting, urging a set of measures for the avoidance of nuclear war.

IPPNW grew rapidly through the years, with sixty national physician groups meeting in a series of congresses in Cambridge, Amsterdam, Helsinki, Bonn, Moscow, Montreal, Hiroshima, Mexico City, and Beijing. In 1985, it was awarded the Nobel Peace Prize, and as its founding Vice-President, I had the pleasure, along with my wife, of sitting next to the King of Norway at the ceremony in Oslo. The chairman of the Nobel committee explained the choice: “IPPNW has educated us and the world on the dangers to life and health that nuclear weapons represent. The prize expresses a hope that bridges can be built over the chasms that represent our fear of the future.”

With the end of the eighties, we had come a long way from the threat of a massive nuclear exchange between the USSR and the USA. There was a sense of wonder that the Northern Hemisphere had managed to weather the Cold War without an episode of nuclear violence. IPPNW leadership communicated directly with Gorbachev and had major hearings with some in Congress and the executive branch. Doctors were engaged in their traditional role of preventing disease and death. In 1987, with international pressure high, Reagan and Gorbachev signed the treaty to eliminate Intermediate-Range nuclear weapons

Beyond the impact of IPPNW on policy decisions, it provided an extraordinary opportunity for person-to-person exchanges, and ultimately communication with a larger

audience during the Cold War. I was asked to lead a party of eight physicians to the USSR in July 1985. It was a time of tension, the Russians highly suspicious of Reagan's intentions to launch a preemptive strike under an SDI umbrella, the Americans viewing the Soviet nuclear arsenal and policies with great distrust. What good could our visit possibly do?

Importantly, there was the richness of the direct interaction with Soviet physicians and health workers. There was also the unusual opportunity to express the concern of many Americans over the nuclear arms race before large audiences of health professionals, and on Soviet television. During our ten-day visit to Moscow, Tbilisi, Kiev and Leningrad, we presented graphic lectures on the "Medical Consequences of Nuclear War" and documented the sheer size and composition of the Soviet stockpile, side-by-side with that of the U.S. As we concluded our trip with our daily exchange of ideas and observations, there was a powerful feeling that one visit was worth a thousand books.

Subsequently, I was contacted in the United States by the daughter of a Soviet dissident in chronic congestive heart failure, desperately in need of valve replacement. The prosthetic valves were not available in the USSR at the time. When I reached Moscow for an IPPNW meeting, I was able to transfer the valves to the dissident's brother, who came to my hotel from his home in Leningrad. Subsequently, cardiac surgery was successfully performed and he became asymptomatic. IPPNW was the bridge.

At our meeting in Cologne in June 1986, a few of us expressed our concern to our Russian colleagues about a Soviet cardiologist named Vladimir Brodsky, who had been imprisoned as a member of the Moscow Trust Group, the Soviet analogue of Human Rights Watch. We were assured that his case would be pressed with Soviet authorities. He was not released. In early August, I sent a letter to Dr. Chazov, the head of Soviet IPPNW and director of the Moscow Institute of Cardiology, in which I said: "Dear Eugene, I write to you in the hope that it may be possible to follow through on the review of Brodsky's case and have more encouraging news about him in the very near future."

In early September, at the World Congress of Cardiology in Washington, I had breakfast with Chazov. He informed me that Brodsky's wife had already left the Soviet Union and was in Vienna, and that Brodsky was now out of prison, back in Moscow, and would be released within days. Two weeks later, my wife and I were awakened by an excited phone call from Switzerland at 5:00 A.M. from Brodsky and his wife, both now safely out of the USSR, and thrilled to be free. We all had dinner at our house on the campus a few months later, and received a first-hand account of their unhappy journey, and its happy ending.

On May 28, 1987, at the time of the Moscow IPPNW meeting, I met with Andrei Saccharov and his wife, Elena Bonner, and had supper at their apartment. It was only five months before that Gorbachev had invited the great Soviet physicist, architect of the Soviet H-bomb, Nobelist and the USSR's most famous dissident to return to Moscow after seven years of internal exile in the closed city of Gorky. Saccharov had written in 1980 that "the questions of war and peace and disarmament are so crucial that they must

be given absolute priority.” But with Glasnost in the air, the matter of Human Rights continued to pre-occupy him, and his voice was never stilled.

These are just a few examples of the “bridge” function. Beneath a broad umbrella, physicians from vastly different national, geographic, political, ethnic, economic and value-based backgrounds succeeded in carrying on a conversation, effecting change, educating each other and our respective constituencies, and pressuring government to act so as to moderate the huge threat to human health and life. The mobilization of thousands of medical voices towards a life-enhancing societal goal can create a power bloc of great influence.

Participation in such a movement is a single facet of Activism, which I consider the “Fourth Dimension” of Biomedicine. Activism means engagement, involvement, sharing a voice or an activity, individual or joint or cooperative action in an area of need. There are many avenues, levels, and values that converge on the term. It represents an understanding that there are large areas beyond our professional work and achievements that link to urgent continental or planetary needs. It stems from the connectivity of all humans and the awareness of that great universal community in which hundreds of thousands of smaller ones co-exist. It reflects a sense of values that derive partially from the Enlightenment and persist in religious and secular humanism over time.

You may ask, “Why expand the notion of participation in the vast array of areas of need to Stanford medical and graduate students, for heaven’s sake? After all, your projects in the last year or more have taken you to 48 countries in Africa, Asia, Europe, South and Central America and Australia. You have spent time in Zimbabwe, Mongolia, Nepal, Tanzania, Nigeria and China. You were involved not only in research but also in vaccine programs, dehydration assessment, improving maternal health and other important goals.”

The answer is that you are entering a new phase, a giant step on the road to the independent lives you will all lead, with huge demands on your time and energy that may limit your vistas as the 24 hour day consumes you. You may find it difficult to find the time to savor and enjoy the activist experience.

During meetings past midnight in PSR and IPPNW we often asked ourselves, when time was short and competing priorities urgent, what can any one person do? Why waste our energy? Can we justify this “digression” from the professional roles that we have trained for all our lives?

At any juncture in the life of a free society and the democratic process, we ask ourselves the same question: what good does it do? One voice in the wilderness cannot change history; add a few more or even a few thousand more and they represent a tiny fraction of the whole.

But as the day ended in Oslo at the time of the IPPNW Nobel award and the procession moved from downtown Oslo to the Aula, the great auditorium, there was a strong sense

of faith in the renewal of the individual and his ability to have an impact. We could then recall the words of Robert Kennedy in Capetown in 1966:

“Each time a man [or woman] stands up for an idea, or acts to improve the lives of others or strikes out against injustice, he [she] sends forth a tiny ripple of hope, and crossing each other from a million different centers of energy and daring, those ripples build a current which can sweep down the mightiest walls of oppression and resistance.”

Awards and Honors

2007 Stanford University School of Medicine Award for Graduate Teaching

Tim Stearns, Biological Sciences and Genetics

2007 Stanford University School of Medicine Award for Outstanding Service to Graduate Students

Karla A. Kirkegaard, Microbiology and Immunology

Arthur L. Bloomfield Award for Excellence in the Teaching of Clinical Medicine

James Baxter, Medicine

Paul Fisher, Neurology and Pediatrics

2007 Henry J. Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education

Audrey Shafer, Anesthesiology

The 2007 recipients of the Henry J. Kaiser Family Foundation Awards for Excellence in Preclinical Teaching

Ben Barres, Developmental Biology and Neurology

It took a lot of organizing, planning and hard work to have the Commencement events run so smoothly. Many thanks to Zera Murphy, Suzanne Bethard, and their team – Ann Davis, Joann Berridge, Jana Baldwin, Mira Engel, Lorie Langdon, Kathy Fitzgerald, Velissa Peairs and Cass Sooter – for a job well done!

Upcoming Events

Medical Grand Rounds – Note: New Day and Location

Starting Wednesday, July 11th Medicine Grand Rounds will occur every Wednesday, from 8 – 9 am, in M-106. For additional information or questions please contact Sarah Pearson at sarahp1@stanford.edu or 650-498-4558.

Awards and Honors

Dr. Donna Bouley, Associate Professor of Comparative Medicine, has won the Dinkelspiel Award for exceptional contributions to undergraduate education and the quality of student life at Stanford. Congratulations, Dr. Bouley.

The following 46 of our students received the prestigious and highly competitive National Science Foundation Graduate Research Fellowships. Several of our students also received Honorable Mention in the NSF Fellowship competition.

Dean's Newsletter July 9, 2007

Board of Trustees Approves Plan to Help University Building Projects

In the December 4, 2006 Dean's Newsletter

(http://deansnewsletter.stanford.edu/archive/12_04_06.html) I delineated the plans and timelines for physically transforming the School of Medicine and the Medical Center during the next 10-15 years. Among the major changes being planned are the new Learning and Knowledge Center (for which the preparative is already underway), the Stanford Institutes of Medicine (SIM) 1-3, and the Foundations in Medicine (FIM) 1-3. Some of these (e.g., the LKC and SIMs) are incremental new facilities, whereas others (e.g., the FIMs) are new facilities that replace ones whose life cannot be productively and financially extended (e.g., Gale, Alway, Lane and Edwards buildings). To make room for these new facilities, an exciting new master plan for the Medical School has been developed which, when completed, will result in a wonderful environment for learning and research that is closely aligned to patient care facilities, and that will serve future generations of students, faculty and staff deep into the School's next century. Equally important, the transformed medical school campus we are now developing will offer important connections and alignments to the University, particularly to the Schools of Engineering and Humanities and Sciences. These physical contiguities help make Stanford unique and promote and facilitate the exciting interdisciplinary programs in research and education underway and being developed.

In tandem with the developments on the School of Medicine footprint, we are also collaborating with the School of Engineering in the development of a new Bioengineering building that will be housed on the Science and Engineering Quad 2 (SEQ2). We are also working with our colleagues at the Palo Alto VA Medical Center to develop one or more research facilities that will facilitate and enhance selected areas of program alignment. It is important to point out that these exciting and transformative changes are guided by the results of our comprehensive Strategic Planning efforts over

the past several years that helped define our overarching mission in *Translating Discoveries*, and closely connect our defined missions in education, research and patient care.

The construction plans of the School of Medicine are coupled with equally exciting and compelling plans at the Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCCH). To provide the highest quality patient care and service as well as meet California seismic mandates, SHC is planning a replacement hospital facility that will ultimately provide the most advanced patient care facilities available. Similarly, LPCCH will be expanding its facilities so that it can continue to provide the most sophisticated and highest quality pediatric services. The timing of these new hospital facilities will also occur during the next 10-15 years. Thus at the conclusion of this process Stanford Medicine will be even better able to serve patients from our communities locally and beyond so that they will benefit from the important innovations and discoveries made by our faculty and students. Taken together we have crafted a bold vision for the future – but one that is compatible and consonant with a world-class institution and the spirit of the *Stanford Challenge* (http://deansnewsletter.stanford.edu/archive/10_23_06.html).

Needless to say, bold visions are also expensive and when the new facility and related infrastructure projects are combined, the cost for just the School of Medicine components of these projects is currently estimated at approximately \$1.3 billion in cost-inflation dollars. Of course we have coupled our facilities planning with equally comprehensive financial planning to assess the feasibility of these projects as well as equally detailed program planning to assure that the projected space will support our long-term program plans and requirements. While portions of these facilities will be funded through debt as well as school and departmental resources and from the President's fund, the largest source is projected to come from philanthropy. Accordingly, we have also been deeply engaged in expanding our Office of Medical Development and in working closely with both Medical School and University leaders to help raise the funds necessary to move these projects forward. This will be a constant and ongoing process but it is important to note that we are making real progress thanks to the efforts of many individuals – especially the wonderful members of our community locally and globally who are stepping forward to help support our facilities and programs. We are deeply appreciative of these wonderful gifts and contributions, and will do all we can to honor those who have placed their trust and resources in helping to make Stanford a leading research-intensive School of Medicine for the 21st century.

Despite our progress to date, it is clear that the challenges before us are significant because of the size and scope of the transformative plan we envision. This is also true of the broader University's plans envisioned through the *Stanford Challenge*. While significant progress has already been made toward the \$4.3 fundraising goal that was announced with the Stanford Challenge in October 2006, it is widely appreciated that raising support for facilities is particularly difficult. Since it is recognized that committing significant resources to capital projects from operating and reserve budgets would require limiting program development throughout the university, the Board of

Trustees has considered a number of options and alternatives. While one approach might be to fund projects through increased debt borrowing, this runs the risk of seriously impacting future resources that might be available for the University as well as the School of Medicine. There needs to be a balance between how much debt is leveraged to support capital programs. Further, the Trustees, who are the ultimate fiduciaries for the University, want to be mindful of how resources from sources like endowments are available to future generations, as well as to those currently responsible for the stewardship of Stanford. Recognizing these challenges, the Board of Trustees announced a decision on June 13, 2007 to increase the endowment payout rate from 5% to 5.5% for the next five years. This increased payout will free up unrestricted funds that can be dedicated to support major facility projects. Because the annual returns on the “Merged Endowment Pool” has averaged 15% during the past 25 years, increasing the payout rate now will provide an immediate source of funds with relatively minimal impact on the long-term financial viability of the university’s endowment. This higher payout rate will be monitored closely with adjustments made should the current market forecasts change. With this decision, each school has been asked to develop plans by which unrestricted general funds can be used for major facility projects.

Because endowment income must be spent in accordance with the specific restrictions of each endowment (and there are over 6000 separate endowment accounts throughout the University!), it is envisioned that the incremental endowment income can be used in place of unrestricted school funds that would be allocated through the operating budget and related programs. Each School has been asked by the Board of Trustees to set up account(s) for the dollars that would be sequestered by this process and which would be used to help support major facilities. Because the School of Medicine is a “formula school”, we have been working on a plan that will permit us to achieve the directive of the Board of Trustees based on the School’s endowment resources – which were at \$2.13 billion as of April 30, 2007. The school’s endowment is located in a wide variety of accounts including central and department funds and endowed professorships– which in the aggregate will yield more than \$26 million in incremental payout per year under the new Board of Trustees’ policy. To assure that we can fulfill the Board of Trustees’ mandate, the Dean’s Office will be working with central funding sources as well as those held in departmental and professorship accounts to permit the appropriate exchanges to take place. Importantly this will **not** result in any decrement of funds coming to faculty, departments or school than would have taken place in the absence of this change in endowment payout policy – which is good news. Indeed had the Board of Trustees not taken this important decision, it is likely that reductions in general operating dollars would have been necessary to meet essential capital developments. Notably, these capital projects can also be envisioned as the conversion of selected financial assets into physical assets – both of which are part of the endowment we will leave to future generations of students and faculty.

While the implementation of this new policy will require the cooperation of faculty and departments, it offers an important step in helping to achieve the facilities plan that I outlined above. While we will continue to raise as many funds as we can from philanthropy, this new policy will reduce the need to leverage excessive debt and will

help provide resources to support projects that may be less achievable from fundraising sources. It should be obvious that the Board of Trustees and University leadership will be closely monitoring how we utilize these resources and whether we are fulfilling their expectations based on this important financial decision. I am confident that we will do so – and pleased that these new resources will help us with the transformative facilities plan that I summarized above and that I have discussed in more detail in prior Newsletters. Unquestionably this is a major step forward for the School of Medicine and the Stanford University.

Defining the Research Laboratory of the Future

To help guide our thinking about the size and scope of the research laboratory of the future, I charged a group of faculty and staff to examine this issue. The goal of this committee was to offer as enlightened a view as possible on how we should best plan for new laboratory space – whether in the SIMs or FIMs – and how research space should be most optimally utilized in the decades ahead. A group of faculty and staff led by Nancy Tierney, Tim Gadus, John Pringle and Daria Mochly-Rosen grappled with these questions, sought advice from the research community at Stanford (over 200 faculty responded to a survey on this issue) and, based on this work, generated a thoughtful and helpful report. You can access their May 2007 report on “Defining the Research Facilities Model of the Future” at

<http://medfacilities.stanford.edu/space/downloads/TaskForceReport.pdf>. I would encourage you to review their report and offer any additional comments you have to Nancy Tierney or John Pringle. In turn I want to thank all who worked on this committee or who contributed to the data collection. This work is already helping to shape our planning for future research facilities at Stanford.

Getting Our Message to the Community on Hospital Renewal and Expansion

As I described above, the Medical Center facilities plans include major capital projects for the School of Medicine, Stanford Hospital & Clinics (SHC) and the Lucile Packard Children’s Hospital (LPCH). These essential projects are critical to the future of the Medical Center and the communities it serves. While the entirety of the hospital renewal and replacement projects are all in the City of Palo Alto, the facilities projects of the School are only partly in Palo Alto (e.g., the Foundations in Medicine (FIMs) that replace the Gale, Alway, Lane and Edwards buildings); the remainder of the facilities projects (e.g., Learning and Knowledge Center and the Stanford Institutes of Medicine 1-3) are governed by the County of Santa Clara and the “General Use Permit (GUP).”

Accordingly, together with the leaders at SHC and LPCH we have been working closely on the “Entitlement Process” with the City of Palo Alto. Because some of you reside in Palo Alto and others have friends and colleagues who do, it is important for each of us to be cognizant of the key reasons why the hospital replacement and renewal projects are so critical and essential to our community. I would like to share some of the reasons with you so that if you are queried, you can respond knowledgeably. Equally importantly I would hope that you would serve as an advocate for these important projects. If you have questions or concerns, please do not hesitate to raise them with me or other leaders in the Medical Center.

Among the major reasons why we (the School, SHC and LPCH) believe the Stanford renewal and replacement projects are so important are:

- **Our patients deserve the best medical care in modern facilities:** New medical innovations and discoveries emanating from basic and clinical research help to assure advances in patient care. Moreover, complex treatments available at SHC and LPCH require a new design for modern facilities. We want to ensure that our quality of care will continue to keep pace with cutting edge technologies and advances in new treatment strategies that optimize patient recovery. Our new facilities will take advantage of the tremendous benefits that emerge from having the hospitals and the School of Medicine housed together. It also means that medical breakthroughs developed at Stanford and in conjunction with the biotechnology and device industry that is uniquely available in Silicon Valley will thus be available in our immediate community.
- **We want to be here when you need us most:** Whether it's a personal emergency, a pandemic or environmental catastrophe (like an earthquake), we want to make certain that we're here for the Palo Alto and the surrounding communities – at the time they need us most. Right now we are turning away hundreds of patients who need emergency or state-of-the-art medical care because of the limitations on our facilities. Rebuilding our hospitals to make them earthquake safe and expanding our emergency capacity will ensure we will be available to help our community in the times of greatest need.
- **We need to take down the “No Vacancy” Sign:** The hospitals must have more space to meet the growing needs of our community. LPCH has an acute shortage of beds and has been forced to turn away critically ill children and refer them to other facilities. SHC cannot admit many adult patients because of a shortage of rooms. Moreover, better management of infectious diseases, single patient occupancy rooms – something that would exist in the new facilities - would facilitate medical and surgical treatments and patient recovery. In addition, the Emergency Medical Facilities for SHC and LCPH are seriously undersized and need replacement.

These are just some of the important factors that mandate the hospital renewal and replacement projects. This month SHC, LPCH and the School sent out some 80,000 copies of the first edition of Stanford Medicine News, a new publication designed to provide updates to the community on the important activities taking place at the Medical Center. Palo Alto is unique in having such an extraordinary medical resource in its own backyard and we need to do all we can to help educate our community about why the preservation and enhancement of the Medical Center is essential to the health and well-being of our community. I hope you will do all you can to help with this education process.

A Focus on Quality

There is an increasing public focus on the quality of patient care being provided at community and teaching hospitals reflected in publicly accessible reports that compare hospitals locally and nationally on various quality outcome measures. This is being coupled with an effort by a number of payers, including CMS (the Center for Medicare and Medicaid Services) to link hospital payments to comparative performance. Among the most well known sources now providing information about hospital and physician performance are the *University Healthcare Consortium*, *Leapfrog*, *Hospital Compare* and *US News & World Reports*. While some are reputation scores, an increasing number are based on more objective metrics of quality performance. Certainly among our very highest institutional priorities is the delivery of the highest quality patient care possible. But it is also clear that our reputation – and financial success as a medical center - will be strongly impacted by how we perform on a variety of quality metrics in comparison to peer institutions. Indeed recent months have seen dramatic reports of hospital success or failure based on how well institutions measure up to these comparative metrics. Needless to say, the scope and validity of the quality measures that are chosen by various organizations can impact outcomes – as can the types of patients and severity of illness being treated at any one center. While innovation and discovery are important aspects of our mission and can differentiate us from our peers, we also need to measure up on the comparative metrics that are being employed. And while many physicians and faculty may quickly retort that these comparative metrics are inappropriate for their type of practice or what they believe constitutes “state-of-the-art” care, especially if they are not rated favorably, such protestations will accomplish little other than deflect us from the reality that irrespective of our opinion, we must work to achieve success on the comparative metrics as a starting point. That said, we can also embrace quality measures into our culture and academic enterprise and thus help shape the national discourse taking place on which metrics to employ and what truly represents outstanding quality of care. But we will only have a voice that will be listened to when we offer our comments and recommendations from a platform of excellence in the defined metrics of quality.

Some of our plans and efforts to achieve outstanding quality of patient care were recently presented to the Board of Directors at SHC and LPCH as well as to the Medical Center Committee of the Board of Trustees. These have been based on joint efforts of faculty and school leaders and hospital leaders. A highly successful program focused on quality and safety has been in place at LPCH for the past 5 years and has yielded considerable success. Indeed, LPCH has received recognition from payers such as Aetna and Blue Shield for “Excellence in Patient Safety and Health Care Quality.” Moreover, LPCH recently ranked #1 in the nation by the Leapfrog Survey assessing evidence-based measures of quality and safety; it has also had the distinction of being a two-time winner of the “Race for Results” from CHCA and its national prominence has enabled LPCH to help shape the debate and discussion about efforts to improve patient quality and safety. Importantly, there is an alignment of faculty and hospital leaders at LPCH in these areas along with a culture of oversight and expectation by the hospital Board of Directors that helps assure continued process improvements. While the metrics used in assessing pediatric practice are simpler and perhaps less rigorous than those being employed at

adult hospitals, LPCH is well positioned to continue to improve and to address the new challenges that will unfold in the years ahead.

During the past six months, leaders at SHC and the School of Medicine have worked diligently to develop additional programs and opportunities to enhance their integrated performance on meeting quality and safety metrics. These efforts will be overseen by the Hospital CEO and Dean and will regularly present progress reports to the SHC/SoM community and its Board of Directors. Dr. Kevin Tabb, Chief Quality and Medical Information Officer at SHC and Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, have overseen a comprehensive Working Group on Quality to generate programs and policies to improve patient quality for SHC. A number of clinical department chairs and hospital leaders participated in this process which made clear that to be successful in this arena, every chair, deputy chief and medical director needs to develop explicit requirements in patient quality for every member of the medical staff. To help facilitate this, we will seek ways for quality patient care performance to be integrated into both the appointment and promotions process for clinical faculty and also into incentive performance bonuses. In tandem, a curriculum will be developed on patient quality that will be used to teach and guide medical students, residents and fellows about the importance of a systematic approach to patient quality. Indeed it is recognized that these metrics will be a critical facet of patient care systems forever more.

To help monitor and facilitate the organizational and the cultural changes that are needed to create a broad medical center climate of quality, SHC is investing considerable resources to expand its quality improvement and patient safety department and to align these services the medical directors and clinical chairs to develop specific quality improvement plans, data analysis and reporting. Of course this will require clinical chairs to personally review and act on these data and to develop annual quality improvement action plans with clear timelines. To underscore the importance of these efforts, senior hospital leaders as well as chairs and school leaders will be evaluated on their performance (and that of their faculty and staff) and have a portion of incentive compensation linked to outcomes.

To help further our efforts in quality it is also planned that SHC and the School of Medicine will create a Center for Quality and Effectiveness that will enable Stanford to lead in clinical quality and in research and scholarship for quality and effectiveness. This new Center will help develop processes and outcomes to assess clinical care, address the gap between outcomes achieved in clinical research and those achieved in clinical practice and help remediate the inequalities in health care access and outcome impacted by factors such as race, gender, and social class among others. I am pleased to note that Dr. Ralph Horwitz, Arthur L Bloomfield Professor of Medicine and Chair of the Department of Medicine has agreed to lead the development of the Center for Quality and Effectiveness.

It is also clear that being transparent about our outcomes and quality metrics, including both areas of success or failure, is of critical importance. Accordingly, a biweekly “quality alert” report is now being sent to hospital and faculty leaders. Moreover, within

six months SHC plans to proactively publish institutional core measures of performance on its own website – a practice that has already been established at LPCH. In addition to regular communications and updates at departmental meetings, the Council of Clinical Chairs, Board of Director meetings, etc., we will also host an annual “quality summit” that brings together faculty, community and hospital leaders to assess where we are – and where we need to go – to become a true leader in this emerging field.

Importantly a number of these activities, policies and programs have been or will soon be launched. While this is important it is abundantly clear that ongoing and across the board efforts will be needed if we are to be successful. Indeed, every community and faculty physician, each chair and medical director and hospital staff– together with School and Hospital – must be continuously engaged, responsible and accountable if we are to be successful. And there is no choice - successful we must be.

A Ban on Industrial Support is Likely to Extend to CME at Stanford

In October 2006 the School of Medicine, together with the Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital, took a national leadership position by instituting a ban on gifts from industry to support educational and related activities (see: Stanford Industry Interactions Policy at <http://med.stanford.edu/coi/siip/>). As we and other institutions, along with a number of regulatory and legislative bodies, examine the data on an additional issue – the interactions of industry with Continuing Medical Education (CME) - the findings are disturbing. In a Perspective article by Dr. Robert Steinbrook entitled “Commercial Support and Continuing Medical Education” in the *New England Journal of Medicine* (2005; 352:534-435 – see: <http://content.nejm.org/cgi/content/full/352/6/534>) it was noted that the majority of support for CME in the USA came from commercial sources – a trend which has continued and even accelerated in recent years - and that now accounts for nearly two-thirds of the cost of current CME activities. While industry claims that that they have a hands-off policy on how these funds are used, the reality appears to be much more intertwined – with promotion of speakers, topics, etc – with the money not infrequently provided through third-party sources.

Oversight of CME takes place through the Accreditation Council for Continuing Medical Education (ACCME), a regulatory body that has tried to create policies to protect the integrity of the education mission. In reality, many of the policies are adaptations to existing realities and raise the very real question of whether truly unrestricted pharmaceutical and device industry support for CME can be achieved in the current climate. While many CME activities take place under the banner of medical schools and teaching hospitals, it should also be noted that a number of for-profit CME organizations have been established that are actively and robustly supported by industry. In fact, in the absence of industrial support, most CME programs could not be solvent – or competitive.

Because CME is required for medical recertification, every physician is required to accrue CME credits each year. Medical schools and medical centers use CME for education as well as for marketing – and so does industry. The negative features

associated with these interrelationships have prompted two recent Congressional hearings, led by Senators Herb Kohl (D-Wis.), Max Baucus (D-Mont.) and Charles Grassley (R-Iowa). In fact, it seems only a matter of time before some forms of regulation are imposed. But regardless of such activities, it is both prudent and responsible for leading institutions to re-examine their CME programs, how they are configured, what they seek to accomplish, and how they are supported. I have asked Drs. Rob Jackler, our newly appointed Associate Dean for Continuing Medical Education, and Myriam Curet, Senior Associate Dean for Graduate Medical Education, to examine this issue and make recommendations to current practice within the next four months. As we did when we established our Stanford Industry Interaction Policy, I am interested in your thoughts and opinion on this topic and thus seek your opinion. Were we to ban industrial support for CME (unless it was clearly and unequivocally unrestricted) it would surely have a number of consequences – both locally and nationally. But it is important that we do the right thing to support the integrity of our programs and our missions in education.

Smoke Free Medical School Goes Into Effect in August

In the April 9th, 23rd and May 21st Dean's Newsletters (see: http://deansnewsletter.stanford.edu/archive/04_09_07.html#1, http://deansnewsletter.stanford.edu/archive/04_23_07.html#7, [http://deansnewsletter.stanford.edu/archive/05_21_07.html #1](http://deansnewsletter.stanford.edu/archive/05_21_07.html#1)), I highlighted some of the recent debates and discussions that have taken place in recent months on the tobacco industry, focusing more specifically on whether or not universities should accept funds for research from this entity. I also noted that even though the University elected to sustain its policy stating that "*individual scholars should be free to select the subject matter of their research, to seek support from any source for their work and form their own findings and conclusions*", on a related matter, the School of Medicine's Executive Committee agreed that it was appropriate to extend the non-smoking policy to cover the entirety of the medical school campus – both inside and outside. This is part of a broader effort to do what we can to promote health among our faculty, students and staff – which includes fostering some activities (like exercise and proper nutrition) and avoiding others (like smoking). Our "Tobacco Free Campus" policy will go into effect on August 1st. I will be sending you more specific information about what this will mean – especially the boundaries for smoking on the medical school campus.

To that regard it is interesting to note that the Cleveland Clinic has just announced a new nonsmoking hiring policy that commenced on July 1st that will ultimately restrict employment to individuals who are unwilling to cease tobacco use through smoking cessation programs. The basis for this decision rests on their commitment as an institution to promote healthy living – especially recognizing that smoking contributes to a number of serious chronic as well as life-threatening illnesses that cost approximately \$75 billion annually in direct and indirect medical costs. Their goal is to play a more proactive role in reducing health care costs by promoting health and wellness.

Clearly the Cleveland Clinic has taken a much stronger stand than we are taking on the issue of tobacco use. But I hope that the policies we are putting into place in the School

of Medicine will help reinforce that smoking is seriously detrimental to health. Coupled with that message will be a series of resources that will appear on a new website to help members of our community engage in smoking cessation programs or pursue other health improvement activities that better promote individual and our collective wellness.

Planning for the Future: Appointment of a Senior Faculty Transition Task Force

There is broad consensus about the importance of mentoring and counseling at the early stages of one's career in medicine and science. There is also recognition that mentoring and career guidance is helpful – and indeed important – throughout one's career. But there is little if any attention paid to guidance or mentoring that may take place at the later stages of one's career. Given the fact that many scientists and physicians are living longer – and working longer – the lack of such guidance is a problem – or at least a challenge.

The need to better formalize our approach to senior faculty transitions was illustrated to me in a discussion that I had with Dr. Gary Schoolnik, Professor of Medicine (Infectious Diseases and Geographic Medicine) a few months ago. Dr. Schoolnik pointed out that he was at an interesting point in his own career – he is well-funded by the NIH, highly productive as an internationally recognized physician and scientist, but cognizant that now entering his early sixties, he should be giving some thought to his own transitions – as a faculty member, investigator, clinician and citizen. But he was also aware that there were no defined individuals or programs to whom he might turn for advice. As we discussed this important topic together with Dr. Harry Greenberg, Senior Associate Dean of Research, I felt that this was an issue that requires some thought and a more formalized approach. Simply put, there is every reason to be as responsive to senior faculty and the issues they face in their lives and careers as we are to more junior faculty and trainees.

Accordingly, I asked Dr. Schoolnik to serve as the Chair of a Senior Faculty Transitions Task Force and also appointed Dr. Kathy Gillam, Senior Advisor to the Dean to serve as Co-Chair. Members of the Task Force include Professors John Boothroyd, Regina Casper, Linda Cork, Harry Greenberg, Peter Gregory, Bob Lehman, Michael Levitt, Jim Mark, Chirsty Sandborg and Stanley Schrier along with staff members Rob Krochak, Ellen Waxman and Sam Zelch.

The charge to this Task Force is to come up with policies, procedures and resources through which advice and guidance can be provided to senior faculty about career and life planning. For some faculty this might involve changing the size or scope of their research - which could mean downsizing for some or increasing the allocation of their effort for others. Similarly this might result in changes in clinical activities and responsibilities or different roles in education or administration. For other senior faculty this may mean opportunities outside of medicine in either the public or private sector. The Task Force is cognizant that a number of factors impact a senior faculty member's decisions and options – including personal factors (e.g., marital status, personal finances, health and family issues, etc.) and professional issues (e.g., research funding, size of lab

group, clinical activities and proficiencies, etc.). There is also a broad range of desires and expectations – some individuals wish to continue working whereas others contemplate retirement or some transition. That said, we anticipate that these issues will increase in the future as our faculty ages and as longevity permits individuals to stay in the workforce much longer than in previous generations. Interestingly, as we were preparing our agenda for this Task Force I noted that some of the issues we are concerned about have a broader platform as pointed out in a recent editorial in the June issue of Nature Medicine (2007; 13:649) entitled “The Young and the Restless” (see: <http://www.nature.com/nm/journal/v13/n6/full/nm0607-649.html>) which unfortunately pits young faculty against old – but also raises important issues and needs for senior faculty.

From my point of view the major reasons for addressing this important issue is to be proactive and helpful. I am well aware that the decisions about transition are highly individualized and I want to underscore that when I refer to transitions I am **not** specifically highlighting retirement or becoming *emeritus* per se. Indeed I would argue that most of our senior faculty are more interested in how their personal transition, whatever form it takes, is associated with new opportunities and challenges – whether in education, research, patient care or other activities within the university or community. My hope is that our Task Force will help guide the kinds of resource or mentoring/career advice programs. Indeed we should be thinking about making Senior Transitions another exciting facet of a career in academic medicine and science.

The Task Force is already engaged, gathering data and setting agendas. I hope that we will have more to report on this important issue later this year.

Upcoming Events

The first of the Outdoor Summer Science Talks at the Cantor Art Museum was very successful. Everyone is invited to attend the next sessions, which are free and open to the public.

Outdoor Science Talk 2 - Recent Advances in Heart Surgery

Dr. Robert Robbins

Thursday, July 12th, 7pm

Outdoor Science Talk 3 - Cool Hands, Better Performance

Professor H. Craig Heller

Thursday, July 26, 7pm

Outdoor Science Talk 4 - Drugs: One Size Does Not Fit All

Dr. Russ Altman

Thursday, August, 9th, 7pm.

Awards and Honors

- **CIRM Awards**

As you will hopefully recall from prior Newsletters, Stanford has been extremely successful in successful awards from the California Institute for Regenerative Medicine. What is likely less apparent, but equally important, is that our Research Management Group (RMG) has also been a leader in working through the administrative and financial issues related to the applications – such that Stanford will be the first to receive the funding for these awards – which is great news. So, in addition to thanking our faculty I also want to thank our RMG staff for their leadership and diligence that has helped make us a leader in science and research administration!

- **Dr. Marilyn Winkleby**, Associate Professor of Medicine and Director of the Stanford Medical Youth Science Program, in collaboration with Drs. PJ Utz (Medicine), Barry Starr and Rick Myers (Genetics) and Parvati Dev (SUMMIT) received the wonderful news that their proposal is one of 31 in the nation that will receive funding from the Howard Hughes Medical Institute “to provide a unique opportunity for the biomedical research community to provide hands-on experiences and rich content to students and teachers, extending their impact to a broader range of the education continuum.” In this competition, 297 institutions were invited to submit proposals and based on these submissions, HHMI has awarded \$1.5 billion in grant support (Stanford will receive \$748,330).

Based on their proposal, the Stanford plan “will help sustain, integrate, and expand three exceptional biomedical outreach programs in the fields of Medical Sciences, Immunology, and Genetics within the Stanford University School of Medicine. The three existing programs will form the foundation for integrated and new activities for high school students, teachers, Stanford students, families, and the community that are not possible through the individual programs. The Initiative will offer scientific training to high school students, with a special emphasis on low-income and ethnic minority students who are in great need of science education. Centered in Santa Clara County, California, the Initiative will draw on local scientific resources and expertise to specifically target the County’s large underserved population and will expand activities to the 11 under-resourced high schools in the San Jose East Side Union High School District that serves 20,000 students.”

This is exciting news for Dr. Winkleby and her collaborators and will permit them to continue offering exciting programs to students and our community. Please join me in congratulating Drs. Winkleby, Utz, Starr, Myers and Dev.

Appointments and Promotions

- **Stéphan Busque** has been reappointed to Associate Professor of Surgery (Transplantation), effective 7/1/07.

- **Eliza F. Chakravarty** has been reappointed to Assistant Professor of Medicine (Immunology and Rheumatology), effective 7/1/07.
- **Lisa J. Chamberlain** has been appointed to Assistant Professor of Pediatrics (General Pediatrics) at the Lucile Salter Packard Children's Hospital, effective 6/1/07.
- **James Chang** has been promoted to Professor of Surgery (Plastic and Reconstructive Surgery) at the Veterans Affairs Palo Alto Health Care System, effective 6/1/07.
- **Alexander D. Colevas** has been appointed to Associate Professor of Medicine (Oncology) and, by courtesy, of Otolaryngology – Head and Neck Surgery, effective 6/1/07.
- **Tina Cowan** has been reappointed to Associate Professor of Pathology and, by courtesy, of Pediatrics (Medical Genetics), effective 7/1/07.
- **Lauren Gerson** has been promoted to Associate Professor of Medicine (Gastroenterology & Hepatology), effective 6/1/07.
- **Iris Gibbs** has been promoted to Associate Professor of Radiation Oncology, effective 7/1/07.
- **Louis P. Halamek** has been reappointed to Associate Professor of Pediatrics (Neonatology) at Lucile Salter Packard Children's Hospital and, by courtesy, of Obstetrics and Gynecology, effective 6/1/07.
- **Paula J. Hillard** has been appointed to Professor of Obstetrics and Gynecology, effective 7/1/07.
- **Susan Hintz** has been promoted to Associate Professor of Pediatrics (Neonatology) at the Lucile Salter Packard Children's Hospital, effective 6/1/07.
- **Kathleen Horst** has been appointed to Assistant Professor of Radiation Oncology, effective 7/1/07.
- **John R. Huguenard** has been promoted to Professor of Neurology and Neurological Sciences and, by courtesy, of Molecular and Cellular Physiology, effective 7/1/07.
- **Ruth B. Lathi** has been appointed to Assistant Professor of Obstetrics and Gynecology, effective 7/1/07.
- **Henry Lowe** has been reappointed to Associate Professor (Research) of Medicine (Medical Informatics), effective 7/1/07.
- **Eric W. Olcott** has been reappointed to Associate Professor of Radiology at the Veterans Affairs Palo Alto Health Care System, effective 6/1/07.

- ***Daniel Palanker*** has been promoted to Associate Professor (Research) of Ophthalmology, effective 7/1/07.
- ***Christopher K. Payne*** has been reappointed to Associate Professor of Urology, effective 6/1/07.
- ***Priscilla S.A. Sarinas*** has been reappointed to Associate Professor of Medicine (Pulmonary and Critical Care Medicine) at the Veterans Affairs Palo Alto Health Care System, effective 6/1/07.
- ***Glyn Williams*** has been reappointed to Associate Professor of Anesthesia, effective 6/1/07.
- ***Sherry M. Wren*** has been promoted to Professor of Surgery at the Veterans Affairs Palo Alto Health Care System, effective 6/1/07.
- ***Wei Zhou*** has been appointed to Associate Professor of Surgery (Vascular Surgery) at the Veterans Affairs Palo Alto Health Care System, effective 7/1/07.

Dean's Newsletter

July 30, 2007

Summer Transitions

For much of the University, the summer session that begins after commencement is a quieter time, with the undergraduate students largely gone and faculty away or otherwise engaged. In contrast, the Medical School and Medical Center hardly miss a beat in summer – and in many ways there is a flurry of activity. New interns, residents, fellows and postdocs arrive and begin their graduate or postgraduate training in clinical medicine and/or research. And with that our Medical Center community is infused with new perspectives, energy and opportunities. On the administrative side, summer brings to conclusion the final phases of budget setting, faculty reviews and salary assessments for the new academic year, which begins September 1st - among many other activities. So, the so-called “lazy days of summer” are more wishful thinking for the Medical Center – although many do take some time for well-deserved vacations. And the Dean's Newsletter often moves to a less regular schedule during the summer months – offering a vacation of sorts to readers and, of course, to its writer!

Healthcare Up in the Air

The good news is that discussions and debates about healthcare in America are on the rise. With the early staging of the Republican and Democrat presidential debates fully underway, commentaries, reflections and recommendations about healthcare in America have become increasingly prominent. And while sweeping changes on the federal level

seem unlikely, at least for now, a number of states are moving forward with healthcare reforms of their own. For example, Vermont proposes to introduce a new state-subsidized health plan to cover the approximately 10% of its citizens who are currently uninsured. Concurrent with this, Vermont also seeks to focus on preventive care and better management of chronic illness as a way of controlling costs. Maine is also seeking a program to enroll the 130,000 state residents who lack insurance in an affordably priced plan from a private insurer based on a sliding scale of household income. And Massachusetts is attempting to institute its “nearly universal” coverage of nearly half a million residents who lack health insurance.

These New England plans, along with the one proposed for California, which I previously reviewed in the *Dean's Newsletter* (see: http://deansnewsletter.stanford.edu/archive/03_12_07.html#1), all strive to address the rising costs of healthcare along with the problems of access and of the large number of uninsured individuals. They also, to varying degrees, include a sharper focus on prevention, wellness and quality. These efforts are all admirable and one hopes that each will be successful— or at least that they will provide an opportunity to assess different approaches to solving this country's health care challenges. While it is important for states to move forward where the federal government or nation as a whole has been unable to do so, it is also clear that the mobility of our citizenry and the porosity of state borders, among many other factors, will eventually make a national solution essential. But what will that look like and when will it happen?

While I promise not to lapse into the role of a movie critic *per se*, it is important to note that further attention to the crisis in health care (beyond the presidential debates and related rhetoric) is taking place this summer with the release of Michael Moore's “documentary” entitled *Sicko* (<http://www.revolutionhealth.com/healthy-living/special-feature/sicko?msc=S20016>), which I had the opportunity to see about 10 days ago. Admittedly it is highly anecdotal, although the various vignettes do help to tell a story that, while clearly organized around a point of view, quite poignantly reveals what works and what doesn't in the US health care system – and how it contrasts to that of nations having more organized systems, such as Canada, the UK and France. While a big fear of Americans is that such systems would mean “rationing” of health care, I think it is fair to say that this already happens based on what insurance companies or HMOs are willing to pay for – something that will only increase as the pressures and costs continue to rise.

Given the severity of the healthcare crisis in this country, it continues to amaze me that doctors have remained so unengaged in the debate. Even more sadly, when they do become involved – not infrequently through organizations like the American Medical Association – they often seem to take on such self-serving positions that they lose the moral high ground or sometimes even a credible voice in the debate. In an opinion piece in the July 25th Washington Post (see: <http://www.washingtonpost.com/wp-dyn/content/article/2007/07/24/AR2007072401850.html>), Regina Herzlinger, a Harvard Business School professor and authority on health care, opines that the AMA recently “declared war on retail medical clinics located in places such as CVS and Wal-Mart” while noting that “these clinics do a lot of good: their convenient locations and extended

hours – they are open usually every day – enable ready access so that busy people need not defer important medical care such as flu shots, and their prices enable the uninsured to obtain care at reasonable costs rather than face the high prices that hospital emergency rooms all too often reserve solely for the uninsured.” Of course the AMA immediately responded that the purpose of their action was to protect the quality of the services being offered (see: <http://www.washingtonpost.com/wp-dyn/content/article/2007/07/27/AR2007072702049.html>). While this is surely an appropriate concern, it is also true that these new market driven health care offerings are also challenging the province of primary health care providers – and they appear to be growing in number and following across the nation.

Of course the fundamental problem is that these new ventures, such as the store based medical kiosks run by nurse practitioners, are just another market-based response to the lack of a clearly defined health care system. And it is likely that other ventures will arise – some driven by a desire to improve health care delivery and others driven by profit – in the absence of a more encompassing approach to health care reform.

I certainly understand that the complexities involved in radically reforming the US healthcare system are nearly overwhelming. But the consequences of not doing so look equally large. I surely do not think that significant reform will take place by the sound-bite solutions of presidential debates or by a polarized political process. What is needed is a much more apolitical and bi-partisan concerted effort that asks first what will improve the health care and health of this nation – and that does so without all the preconceived and often economically or emotionally biased positions on what will not work. I recognize it is Pollyannaish to think that this will happen imminently – but I also think that it will happen, indeed that it needs to take place, since the current system is neither sustainable nor truly defensible. I also hope that academic medical centers will offer a different voice to this debate than that which has been representing medicine and doctors heretofore.

Tobacco Beyond Stanford School of Medicine

Going from movie critic (see above) to book reviewer is dicey at best. But for those interested in public health, public policy and some of the major economic forces driving both, Alan Brandt’s recent book entitled *The Cigarette Century: The Rise, Fall and Deadly Persistence of the Product That Defined America* (Basic Books, 2007) is worth knowing about. Brandt is the Amalie Moses Kass Professor of the History of Medicine and History of Science at Harvard and is a highly credible scholar. In his book he addresses major questions of personal, social and corporate responsibility by focusing on how the tobacco industry, which first got its foothold in the USA in the 1880s and rose to prominence following World War I, came to influence so profoundly not only health outcomes (20% of all deaths each year in the US are tobacco related, and tobacco-related deaths represent the second leading cause of death in the world) but the entire economics of our nation. He also delves into our response – or lack of response – to the data regarding tobacco use and disease.

In September the Stanford School of Medicine will take the additional step of banning smoking outside as well as inside of its buildings (smoking is already prohibited inside buildings). This is part of our overall effort to improve the health and wellness of our community and will be coupled with access to smoking cessation programs as well as other wellness programs. It is a small but important step.

I was reminded of the larger issues involving tobacco use when I was asked to make some opening comments to the 4th Meeting of the World Health Organization (WHO) Study Group on Tobacco Product Regulation when it met at Stanford on July 25-27th. While various restrictions on smoking in a number of states and cities are helping reduce smoking among adults in the USA, there are still clearly vulnerable populations – especially teens and the impoverished - who are continuing to or beginning to smoke. Advertising and marketing by the tobacco industry help to foster this and create the dependencies that addict new generations of smokers. This problem is even worse in other parts of the world – which makes the work of groups like the WHO so important. Given the impact of tobacco related illnesses on mortality, disease morbidity and health care costs, one would think that reducing or eliminating tobacco use would be a high priority for nations around the world. Such priorities and concerted efforts led to the elimination of polio generations ago and could do the same for tobacco. Doing so is certainly possible and highly desirable– just not politically expedient.

So while banning smoking anywhere on the Stanford School of Medicine campus is just as small step given the magnitude of the problem, it is a step, which if taken by others could have a significant pro-health impact. We need to work with our colleagues in the university and community to establish similar policies.

Update on Facilities Planning

In recent weeks much has been written in the local media about the hospital expansion projects. These efforts are incredibly important – as I addressed in the July 9th issue of the Dean's Newsletter (see: <http://deansnewsletter.stanford.edu/#3>). Less has been reported about other Medical School projects that are currently underway but that are not located in the City of Palo Alto. I wanted to give you a quick update on their status as well.

Three major projects are underway or being actively planned. The first is the Connectivity Project, which is currently underway, albeit mostly below ground (although the closure of the south parking lots certainly calls attention to it). This project involves the location and relocation of major utilities and the creation of infrastructure and underground tunnels that will support the Learning and Knowledge Center (LKC) and the Stanford Institutes of Medicine-1 (SIM1) as they move to the next phase of construction.

Presently the LKC group is working through interior design issues and preparing for construction (see <http://lkc.stanford.edu/> for regular updates). The site for the future LKC-1 is the Fairchild Auditorium, which is currently planned for demolition beginning in mid-October. The actual ground breaking for the LKC is scheduled for March 2008, but this will require approval of the Board of Trustees, which is anticipated this October.

That said, we are currently on schedule – although we still have some major philanthropic work to complete.

The architects for SIM1 are also completing the schematic programming. They have made major progress in defining the size and layout of this exciting facility. The proposed Site Plan for SIM1 was presented to the Ad Hoc Board Committee for the SEMC (Science, Engineering and Medicine Campus) on Wednesday, July 25th and received favorable reviews. The next step for SIM1 is to proceed to architectural design, and we currently are on schedule for this as well.

There are a lot of other projects being planned or worked on, but for the first three – the Connecting Elements, LKC1 and SIM1 – we are making great progress, and we are adhering to our timelines and budgets. Clearly more to follow!

Awards and Honors

- **Dr. Marilyn Winkleby**, PhD, MPH, Professor of Medicine has been named the recipient of the 2007 Robert F. Allen Symbol of H.O.P.E. (Helping Other People Through Empowerment) Award. This national award honors individuals who have made outstanding contributions to promoting cultural diversity within health promotion or who have demonstrated significant achievement in serving the health promotion needs of underserved populations. Dr. Winkleby received her award at the National Wellness Conference on July 18th in Wisconsin.
- **Dr. Lubert Stryer**, the Mrs. George A. Winzer Professor of Medicine, Emeritus, has been named one of the 2006 winners of the National Medal of Science, the highest honor and award conferred by the USA. He received his award at a White House ceremony on July 27th (see http://med.stanford.edu/news_releases/2007/july/stryer.html for additional coverage).
- **Dr. Ann M. Arvin**, Lucile Salter Packard Professor of Pediatrics, Vice Provost and Dean of Research and Professor of Microbiology & Immunology, has been elected to serve a four-year term on the NIAID Council.
- The American College of Rheumatology (ACR) has just announced its 2008 award winner, including these Stanford recipients:
 - **Dr. Edward D. Harris, Jr.**, George DeForest Barnett Professor of Medicine, Emeritus has received the Presidential Gold Medal, the College's highest award.
 - **Dr. Garrison Fathman**, Professor in Medicine, Immunology and Rheumatology, has been named as an ACR Master.
 - **Kate Lorig**, Professor in Research (Immunology and Rheumatology), is the first non-M.D. to become a Master of ACR.

Congratulations to all!

Appointments and Promotions

- **Sarah M. Horwitz** has been appointed to Professor of Pediatrics (General Pediatrics), effective 8/1/07.
Profile: http://med.stanford.edu/profiles/Sarah_Horwitz/
- **Donna M. Peehl** has been appointed to Professor (Research) of Urology, effective 8/1/07.
Profile: http://med.stanford.edu/profiles/Donna_Peehl/
- **Eunice Rodriguez** has been appointed to Associate Professor (Teaching) of Pediatrics, effective 8/1/07.
Profile: http://med.stanford.edu/profiles/Eunice_Rodriguez/

Dean's Newsletter August 20, 2007

Progress and Transitions in the Neuroscience Institute

In the May 21st Dean's Newsletter (see

http://deansnewsletter.stanford.edu/archive/05_21_07.html#4) I discussed the importance of the Neuroscience Institute as an important component of the **Stanford Challenge** (see:

http://deansnewsletter.stanford.edu/archive/10_23_06.html,

http://deansnewsletter.stanford.edu/archive/03_12_07.html#3). I highlighted the *Challenge* as an opportunity for the neuroscience community at Stanford to construct a bold and compelling vision that could transform this rapidly evolving field by developing a bold and integrated research agenda. Indeed that was my own challenge to the group assembled at the Neuroscience Institute Retreat at Asilomar on May 6-8th. I am pleased to report now that the NIS community has galvanized its efforts and has addressed this challenge in an exciting manner. Specifically, NIS has developed the blueprint for a fundamental and integrated research agenda that it has codified under the banner of "**Neuro-X: Brain, Behavior and Society**". Its 55-page working proposal seeks to integrate observations that extend across the entire continuum from molecules to neurons, neural circuits, behavior, cognition and society. In tandem, the NIS aims to catalyze and accelerate basic discovery and prospects for translating new innovations into clinical practice. In doing so, **Neuro-X** will seek "a deeper understanding of the mind and how it is shaped by biological and social processes; improvements in human health, longevity, well-being and productivity; and applications to social policy grounded in science, law and ethics."

In addressing this broad continuum, the NIS community has set as a goal the engagement of faculty from virtually every school at Stanford through five discrete and integrated

research themes, together with new centers and programs to support research and clinical programs and innovative education and training programs. Ultimately these efforts will be supported and enhanced by new research and clinical facilities as well as the other resources needed to stimulate new programs, discoveries, innovations and advances in patient care.

The *Neuro-X* vision and goals propose five major experimental programs or themes:

1. **Neural circuits: bridging molecules to mind.** Investigators across the university will work to achieve a detailed understanding of the molecular mechanisms underlying the plasticity of synapses and circuits. They will also track changes in the activity of ensembles of synapses, neurons and circuits as well as visualize the structural changes in synapses and circuits in response to various experiences. Investigators will also develop tools that will enable the control of neural activity in specific sets of neurons and circuits. This will help determine the molecular and cellular basis for the functioning of neural circuits and thus help to define the fundamental building blocks for cognitive functions and behavior. This research agenda will be facilitated through the creation of a new *Program in Neural Circuit Control*.
2. **Imaging neural circuits in action.** Over the last decades, imaging techniques have provided new insights into the structure and function of neural circuits. This is a rapidly developing area of innovation and discovery that is already advanced at Stanford. These efforts will become even further developed through the establishment of a *Center for Cognitive and Neurobiological Imaging* that will help link investigators and students across the University. The resulting resources and technologies across the scale of analysis (from molecular to cellular to organ and system levels) will further the ability to decipher neural circuit and brain function during perception, cognition and action.
3. **From experimentation to computation and theory.** In this program the daunting task of understanding how neural circuits produce complex brain functions will be made possible through powerful computational platforms and highly refined theoretical models. These efforts will be advanced by the *Center for Mind, Brain and Computation*.
4. **Solving the Riddle of Disease to Treat and Prevent Brain Disorders: *The Program for Translational Neuroscience at Stanford*.** This broad initiative will foster connections between insights and discoveries emanating from basic research and the care of adults and children. It will facilitate the creation of a culture of interdisciplinary collaboration in tandem with novel platforms that will enhance translational research (e.g., neuroimaging, neural engineering and prosthetics, drug development). This program will build on efforts already underway to understand the basis for neural circuit malfunction and repair as well as the genes and molecules that perturb circuit function in disease. It will also strive to develop treatments, intervention and tools that correct faulty neural

circuit function. It will be important to develop, in addition to research programs and facilities, the clinical and hospital facilities that will enable this important work to be carried out.

5. **Neuroscience and Society.** Advances in neuroscience evoke new challenges in ethics, education, business, the law and society. This initiative will attempt to link and bridge these domains – from K-12 education to a better understanding of how the human brain makes decisions that influence both positive and negative behavior. To help address these important issues a *Center on the Brain and Society* will be developed as part of the *Neuro-X* initiative.

These important themes and research programs will be further enhanced by the development of various proposed cores, including:

1. A Behavioral and Functional Neuroscience Laboratory
2. Gene Vector Core Facility
3. Instrumentation Core Facility
4. Interventional Neuroscience/Circuit Control Facility

In addition to these cross-cutting themes and cores, the NIS and its *Neuro-X* program also envision the development of a number of interdisciplinary programs that will be more focused or disease based. These are also evolving but among those currently in the planning phase are:

1. Alzheimer's Translational Research Center
2. Autism Program
3. Center for Down Syndrome Research and Treatment
4. Epilepsy Program
5. Mood Disorders Research Program
6. Motor Control Program
7. Pain and Analgesia Research Program
8. Parkinson's Disease Program
9. Neural Stem Cell Program
10. Sleep Disorders Program
11. Spinal Cord Injury and Repair Program
12. Stroke Center

Ultimately, the success of the NIS Neuro-X program will rest on the construction of new facilities for research and patient care – which are included in the master plans for the School of Medicine and Stanford Hospital & Clinics respectively. In addition, the NIS is planning exciting training programs as part of the Neuro-X effort along with the recruitment of new faculty to further amplify the excellent research and clinical programs already extant at Stanford.

This exiting proposal emanated from a group of leaders in the Neuroscience Institute. I would like to particularly thank Dr. Bill Mobley who has served as the Director of the

NIS from its inception. In developing the *Neuro-X* program he worked closely with Professors Dick Tsien, Sue McConnell, Hank Greely, Jay McClelland, Rob Malenka, Bill Newsome, Alan Schatzberg and Brian Wandell along with Lang Ahn Pham and more than 35 neuroscience faculty across the University. I want to extend my thanks and appreciation to each of them.

The development and construction of the *Neuro-X* program also led Dr. Bill Mobley to reflect deeply on his own focus and plans for the future. With the delivery of this wonderful Neuro-X proposal, Dr. Mobley has informed me that he has elected to step down as Director of the NIS and focus his energies on his own important research, which has received less of his valuable time and energy than he would like. I want to thank Dr. Mobley for all the important and significant work he and his colleagues have accomplished during the nearly four years that he has served as the Director of the Neuroscience Institute. I also want to thank him for the exciting new opportunities that he and his colleagues have created in the *Neuro-X* program. I am in the process of considering Dr. Mobley's replacement and will be sharing information about that in the near future.

One further success of Dr. Mobley, along with Drs. Rob Malenka, Craig Garner and other members of the NIS, has been the recruitment of Dr. Tom Südhof, who has agreed this past week to join Stanford. Dr. Südhof is currently Professor of Molecular Genetics, HHMI Investigator, Director of Basic Neuroscience, and holder of the Gill as well as the Loyd B Sands Distinguished Chairs in Neuroscience at the UT Southwestern School of Medicine (see: <http://www8.utsw.edu/utsw/cda/dept120915/files/144559.html>) where he has had an enormously distinguished career. Dr. Südhof's research interests focus on the machinery that mediates the targeted secretion of neurotransmitters at a synapse. His laboratory is particularly interested in how neurons assemble the presynaptic secretory apparatus precisely at the synaptic junction, how ultrafast neurotransmitter release is achieved, and how release is modulated under conditions of synaptic plasticity. Dr. Südhof is being proposed to join Stanford as the first incumbent of the Avrum Goldstein Chair and his work will have a major impact on the entire neuroscience program. Please join me in welcoming Tom Südhof to Stanford.

This is a time of significant and exciting developments, challenges, transitions and opportunity in neuroscience. We have a remarkably accomplished and talented neuroscience faculty at Stanford and with the *Neuro-X* program we have the opportunity to transform this field and make Stanford a world leader in this important area of research, education and patient care. To paraphrase Winston Churchill, this is not the beginning of the end, but rather the end of the beginning – with exciting times ahead at Stanford.

More About Industry Marketing and Academic Medical Centers

In October of 2006 the Stanford School of Medicine initiated its Industry Interactions Policy (see: <http://med.stanford.edu/coi/siip/>). In doing so, we became one of a handful of academic medical centers to take a strong position on the intrusion of marketing by

industry into education and clinical programs. Over the subsequent 11 months an increasing number of medical schools and academic medical centers have adopted similar policies, some based on the work done at Stanford. As I noted in the July 9th Newsletter (http://deansnewsletter.stanford.edu/archive/07_09_07.html#5), our policies continue to evolve, and we are presently examining the broad question of industry support for Continuing Medical Education through a broad faculty committee led by Dr. Harry Greenberg, Senior Associate Dean for Research. We anticipate that the work of this committee will be completed in the next several months.

Outside of Stanford, issues surrounding industry support for physicians involved in education programs – or for gifts from industry to medical schools and hospitals – has received increasing public attention, including a six-part story in the August 6th Los Angeles Times (<http://www.latimes.com/features/health/la-he-bribingthegatekeeper6aug06,1,7957877.story>) as well as the announcement in the August 4th NY Times that Senator Charles Grassley (R-Iowa) has called for the formation of a registry of drug company payments to physicians. Whether this constitutes a harbinger of federal regulation or is simply another public warning, it is clear that there is an increasing concern about this issue. These developments underscore the value and importance of our decision last year to self-impose restrictions at Stanford. We strive to be a role model among academic medical centers, and I do believe we are fulfilling that intention on this issue– as well as many other important ones.

Changes in Medical Education Leadership

Dr. Charles Prober, Senior Associate Dean for Education has asked me to share with you some of the key leadership changes he is initiating in medical student education and curriculum oversight. These include:

Clarence Braddock III, MD, MPH will be assuming the role of Associate Dean for Medical Education and Chair of the Committee on Courses and Curriculum. Since his arrival in 2003 from the University of Washington, Dr. Braddock has been instrumental in developing and overseeing the very successful Practice of Medicine (POM) course. In addition to being an accomplished and compassionate clinician and effective educator, Dr. Braddock is a recognized national expert in patient-physician communication, informed decision making, and medical ethics education.

As Dr. Braddock takes on his new role, *Preetha Basaviah, MD* will become the Director of POM. Recently recruited from UCSF, where she served a Co-Director of the “Foundations” program in their preclinical curriculum, Dr. Basaviah is recognized for her superb clinical, teaching, and mentoring skills. In addition, *Andrew Nevins, MD* will be increasing his efforts in the Standardized Patient Program, through his appointment as Medical Director. Dr. Nevins’ leadership of this program has resulted in its continued improvement and increasing utilization by both preclinical and clinical students.

Other leadership changes include:

Elizabeth Stuart, MD, one of the leaders of the highly successful pediatric clerkship, has been appointed Director of Clerkship Education and Chair of the Committee on MD Performance Assessment and Advising. Dr. Stuart will be working with all clerkship Directors, with the goals of continuing to enhance clinical training, while improving the timeliness and richness of student evaluations.

Laurence Baker, PhD will be assuming the role of Director of the Scholarly Concentration Program. Dr. Baker also will become Chair of the Committee on Medical Student Scholarship, the committee responsible for the review of all Medical Scholar applications.

William Mobley, MD, PhD and **Audrey Shafer, MD** will be leading the development of a new program, *Translating Discoveries*, a program that will be replacing the Applied Biomedical Science series. Stay tuned for the unveiling of this exciting initiative!

I also want to add my thanks to Dr. Charles Prober for his leadership in continuing to shape our education programs – and to achieve our shared goals of having the most innovative program possible in medical education.

Leadership Changes in the Department of Medicine

Dr. Ralph Horwitz, Chair of the Department of Medicine, has let me know of the following changes in the leadership in the department. First, he and Kevin Tabb, Chief Quality and Information Officer, have announced the appointment of **Dr. Clarence Braddock**, Associate Professor of Medicine, as Associate Chair for Organizational Improvement and Medical Director for Quality at Stanford Hospital and Clinics. In his new role, Dr. Braddock will oversee quality, patient safety and organizational improvement for the department. He will also take leadership in introducing educational initiatives focused on quality and safety for students, residents and fellows in the department. As evidenced from Dr. Prober's announcement (see above), Dr. Braddock is taking on a number of important leadership roles in the Medical Center

In addition, Dr. Horwitz has announced the reorganization of the department chair's office whereby a number of faculty have assumed increasing responsibility for leadership functions within the Department. To reflect this enhanced level of responsibility and authority, the following individuals have been named Vice Chairs: **Andy Hoffman** for Academic Affairs; **Larry Leung** for the Palo Alto VA; **Kelley Skeff** for Education; and **Ann Weinacker** for Clinical Affairs. **Sandra Horning** has also been named Vice Chair for the Department.

Please join me in supporting all of these faculty in their efforts on behalf of the department and medical school.

Palliative Care Program at Stanford Hospital & Clinics (SHC) Opens

On August 1st SHC opened a Palliative Care Program to provide patients and families with the highest quality of supportive and quality of life care for a variety of challenging symptoms, including pain, nausea, and shortness of breath. The new Team includes Dr. Stephanie Harman along with Judy Passaglia, RN, MS and Sandy Chan, LCSW. The Palliative Care service is available to assist with symptom management and with discussions of goals of care and management, including advanced directives, communications about prognosis, treatment options, hospice care and family support. A consultation by the Palliative Care service requires a physician order. The team can be reached at 723-6661 or Pager 26254.

Palliative Care Services are also well established for children and families at the Lucile Packard Children's Hospital. See

<http://www.lpch.org/diseaseHealthInfo/healthLibrary/terminallyill/pliativ.html> for additional information.

Conversing with Seniors at the Hyatt

On Tuesday July 31st I had the pleasure of delivering a presentation to over 150 residents at the Classic Hyatt on Sand Hill Road. The residents of the Hyatt represent a highly knowledgeable community – many with strong ties to Stanford. I had the opportunity to discuss a wide array of issues such as the impact of healthcare on the public trust in our communities and nation – along with the remarkable advances that occurred in medicine during the second half of the 20th century as a consequence of basic and applied research.

Upcoming Event: "Inside Terrorism: the X-ray Project"

From September 4-15 the Radiology Interest Group, co-sponsored by the Stanford Medical Student Association and the School of Medicine, among other groups, will be hosting an exhibit entitled "Inside Terrorism: the X-ray Project." The exhibit will be held in the Fairchild Auditorium, and there will be an opening reception on September 4 from 5:30 - 7:30 p.m.

This exhibit uses X-rays and CT-scans of the victims of terrorist attacks from hospitals in Jerusalem to explore complex social issues surrounding terrorism. The School sought to be thoughtful in its review of this project and is sensitive to various points of view of this topic, especially as it manifests itself in the Middle East. However, terrorism is a worldwide phenomenon that knows no boundaries. While the images in this exhibit are taken from Jerusalem hospitals, the radiographs and CT-scans cannot distinguish race, religion, age, or sex. As such they represent the broad cross-section of people who, tragically, are the targets of terrorist attacks, such as commuters on the London subway system and on the trains in Madrid, celebrants at a wedding in Amman, Jordan and at a bat mitzvah in Hadera, Israel, little kids eating pizza, tourists in Bali and Egypt, people praying in churches and mosques and synagogues. Because terrorism transcends geographic as well as religious, ethnic and societal borders, the School supports this

exhibit, and I encourage you to see it while it is at Stanford. More information about the exhibit can be found as <http://www.x-rayproject.org>.

In addition to awakening our knowledge about the consequences of terrorism through efforts like the X-Ray Project, the medical profession has also had to confront the role of physicians as terrorists in light of the horrendous events that recently occurred in the UK – where doctors were responsible for acts of terrorism. As pointed out by a perspective piece in the August 16th issue of the *New England Journal of Medicine* (2007;357:635-637) entitled *When Doctors Become Terrorists* by Dr. Simon Wessely (see: <http://content.nejm.org/cgi/content/short/357/7/635>), these awful experiences are not new. Indeed, doctors have played a role in past and recent terrorist activities, forcing us all to confront our roles and be aware of the possibility of crossing the line of humanism and professionalism. As Wessely notes, “An idealistic doctor can indeed become fixated on disease and its eradication, and there are times when even obsessive single-mindedness can serve a useful purpose. But danger lurks if that single-mindedness is not tempered by empathy for the plight of the individual. If the doctors now in custody are indeed judged to have planned mass murder on the streets of London, this is a failure not of medicine but of humanity.”

Employee of the Year Spirit Award

I have received the following announcement from the Spirit Award Selection Committee. I hope you will take the opportunity to nominate someone for this award.

Dear Colleagues:

The School of Medicine is pleased to announce the Dean's 2007 Employee of the Year Spirit Award Program that will take place during the Fall of 2007. This award will acknowledge two staff members – one exempt and one nonexempt – who have been selected for providing outstanding contributions to the mission and vision of the School of Medicine. Dean Pizzo will award each of the two selected staff members with a \$1,500.00 cash award at the School's Annual Staff Recognition Banquet on November 8, 2007.

Criteria and Eligibility

Any faculty, staff, student, fellow and post doc working at the School of Medicine may nominate any eligible staff members (i.e., non-exempt and exempt) – bargaining unit workers are not eligible – in any department or administrative area who meet the award criteria. To be selected, staff must consistently demonstrate the following traits:

- Customer service
- Positive attitude
- Initiative

- Dedication
- Motivation

Staff members must have been employed as regular employees, at least half-time (50% FTE) or more, in one department/unit for the past 2 years.

Nomination Process

Nomination Ballots can be accessed online at <http://med.stanford.edu/SPIRIT>. You may fill out the online form and then click the SUBMIT button (only once) – and your ballot will be forwarded to the SPIRIT Award Selection Committee, Human Resources Group. If you wish, you may print out a hard copy of the ballot or obtain one from your department DFA, fill it out and forward it directly to the Spirit Award Selection Committee, c/o Human Resource Group, Medical School Office Building, Mail Code 5460. All ballots must be received by the Selection Committee by Friday, September 14, 2007. Late ballots will not be accepted.

Recipients will be selected and notified in late October and will be invited to attend the Dean's Recognition Program on November 8th.

We are quite excited to be bringing this award forward once again and hope you will use this opportunity to nominate deserving employees. Please let me know if you have any questions (or suggestions) about the aforementioned process or award.

Thank you for your participation!

Awards and Honors

Kristen Whitaker, 2nd year medical student, and **Elizabeth Chao**, a Ph.D. graduate in the Biochemistry Department, were selected through a highly competitive national competition to participate in the 6th annual Paul Ambrose Scholars Program and attended the Leadership Symposium in June in Washington, DC. Congratulations to Kristen and Elizabeth.

Appointments and Promotions

- **Ramona Doyle** has been reappointed to Associate Professor of Medicine (Pulmonary and Critical Care Medicine), effective 8/1/07.
- **Stephen A. Felt** has been appointed to Assistant Professor of Comparative Medicine, effective 12/1/07.
- **Sarah M. Horwitz** has been appointed to Professor of Pediatrics, effective 8/1/07.

- **Monisha Kumar** has been appointed to Assistant Professor of Neurology and Neurological Sciences, effective 7/1/07.
- **Geoffrey K. Lighthall** has been promoted to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 8/1/07.
- **Daniel J. Murphy** has been promoted to Professor of Pediatrics (Cardiology) at the Lucile Salter Packard Children's Hospital, effective 8/1/07.
- **Donna M. Peehl** has been promoted to Professor (Research) of Urology, effective 8/1/07.
- **Edward T. Riley** has been reappointed to Associate Professor of Anesthesia and, by courtesy, of Obstetrics and Gynecology, effective 8/1/07.
- **Eunice Rodriguez** has been appointed to Associate Professor (Teaching) of Pediatrics, effective 8/1/07.
- **David A. Spain** has been reappointed to Professor of Surgery, effective 8/1/07.
- **Daya Upadhyay** has been appointed to Assistant Professor of Medicine (Pulmonary and Critical Care Medicine), effective 9/1/07.
- **Irene L. Wapnir** has been reappointed to Associate Professor of Surgery, effective 8/1/07.
- **James Zehnder** has been promoted to Professor of Pathology and of Medicine (Hematology), effective 8/1/07.

Dean's Newsletter

September 10, 2007

Learning Medicine in a Global Community: Another Year Begins

Medicine, like most of our lives, has become increasingly global in its dimensions, reach and impact. It was only a decade ago that many major academic centers in this country viewed medical care from a decidedly United States-centric perspective. Indeed, many medical centers (e.g., Mayo, Cleveland Clinics, Johns Hopkins, Partners) established international centers that catered to international communities whose members were willing to travel to their various centers for medical or surgical interventions. I would be remiss if I did not also say that a significant financial motive drove some of these programs, since payment was usually cost and cash based. While many international patients continue to travel to the U.S. (or Europe or Australia) for personal healthcare, a

notable change is unfolding wherein a number of countries (e.g., India and Thailand, among others) are offering less expensive high quality procedures, such as joint replacements, that are attracting U.S. patients and companies. Another example, and one consonant with Thomas Friedman's "*The World is Flat*" hypothesis, is that many U.S. hospitals have begun using digital imaging technology to have their emergency nighttime radiographs requiring immediate assessment (when their own radiology staff are out of the hospital) read by radiologists in countries like India, where time zone differences provide opportunities for rapid information sharing.

In addition, international medical graduates train in various medical and surgical specialties in the U.S. (as well as other countries) and constitute an important component of our medical workforce. At the same time, U.S. medical students and physicians carry out clinical work, research or education programs in other nations around the world. Also, a number of medical schools oversee medical education or research programs in Asia, Africa, the Mid-East and elsewhere, and an increasing number of U.S. students desire an international experience as part of the training or plan to spend some portion of their time abroad during their career. And of course, the global nature of medicine is well evidenced by the fact that infectious diseases more rapidly traverse geographic borders through air travel, and potentially preventable disorders in the U.S. (e.g., tobacco use, poor nutritional habits and consequent obesity) may, regrettably, be exported or emulated globally, with consequent healthcare consequences.

More than ever it is important that we learn and teach medicine and science with greater global awareness and intent. Cultural sensitivity and an increased appreciation of the impact of different social and ethnic mores as well as differences in the perception of disease – including its treatment or prevention - are enhanced and enriched by learning in a more diverse community. One of the wonderful features of Stanford Medical School is the diversity of its students. I was pleased to witness this diversity once again when our incoming First Year Students arrived on August 30th for Orientation and the beginning of classes. Of the 86 incoming medical students, 18 were born in countries outside the United States and 14% are underrepresented in medicine. Students also came from throughout the U.S., although California led the field as the birthplace to 25 of the incoming students. (Of course I might add that some have considered California as a foreign country in its own right). The rest come from 23 other states and the District of Columbia – making for a geographically and culturally enriched incoming class. So we have much to celebrate in the broad diversity of our new students– which we all believe plays an important role in the overall educational experience and opportunities for the entire medical school.

Our new students are talented in a number of important ways. They were selected from an applicant pool of 6599 (yes, that is 1 out of 77 applicants who finally join Stanford!) and did their undergraduate work at 37 different colleges or universities. Of these Stanford and Harvard led the pack, with 12 and 11 graduates respectively, followed by graduates of Yale (8), Johns Hopkins (7) and MIT (5). The majority (59) concentrated in biological sciences as undergraduates, 22 in physical or engineering sciences and the

remainder in humanities. Moreover, a quarter of the class enters medical school with one or more advanced degrees – and many plan additional ones during their time at Stanford.

In addition to our incoming medical students, 7 of our PhD students enrolled in the Masters in Medical Science Program pioneered by Dr. Ben Barres, Professor of Neurobiology. This program provides a grounding in medicine for selected students whose discovery based investigation may address translational research.

With each new class we seek to continue to enhance the Stanford legacy by training leaders and critical thinkers as well as excellent and caring physicians. We expect our students to be the transformers of tomorrow's medicine, biomedical science and healthcare. We take this responsibility seriously and endeavor to develop and refine our unique and exciting education programs, which were rejuvenated as the New Stanford Curriculum in 2003 (see: <http://med.stanford.edu/md/>). To an ever-increasing degree, the special focus of our education offerings accounts for why outstanding students like those who joined us last week chose to come to Stanford – and why we invited them to be part of our community. We recognize that each has unique and highly individualized talents, knowledge, interests and goals, and it is our responsibility to assure that their dreams and aspirations are fulfilled, while recognizing that these will evolve and take many unanticipated directions during the years ahead.

As I underscored during my welcoming comments at Orientation, the opportunity at Stanford is to train both broadly and deeply and to do so in a way that permits opportunities for lifetime transitions and opportunities. Medicine and science are among the most exciting and fulfilling career paths that I know of, and they offer a lifetime of learning, contributing to the public good and advocating for positive world changes. For many this will mean traditional pathways that include clinical medicine or specialty care in either academic centers or communities around the nation. Many will combine this with career paths that include (sometimes exclusively) a commitment to research and/or education. Others will follow other pathways at various stages of their careers – as hospital, medical school or university leaders and administrators, in industry or consulting, as part or full-time artists, public health or international health leaders and numerous other paths. For many, career paths will change over time – which is why a commitment to lifetime learning and to serial skill acquisition is so important. And if these are done wisely (and of course with some luck) a life of continuing personal discovery and opportunity can result, and one's career rarely, if ever, becomes a "job" in the more traditional sense.

Regardless of the path chosen, it is important for every Stanford student and graduate to be an advocate for change and leadership in their professional or personal communities, locally or globally. There is much that needs such leadership, both now and in the future. Whether it is advancing new discoveries, including in areas where new territories must be explored and failure looms high, or in tackling some of the health woes of our society, we can each make a difference. I have written all too often about the need for leadership in helping to transform our nation's healthcare or in confronting the policies that pit science against religion or politics. Thankfully, these are topics that many throughout the nation,

and indeed the world, are increasingly discussing and for which they are, sometimes, seeking solutions. These issues will likely grow larger as national resources for investment in science and education – and health care – are limited by unfortunate global conflicts and ideologies. This is another reason for viewing medicine today as part of a global effort and enterprise for which bold new visions are needed and for which Stanford can play an important role.

Stanford Medical Youth Science Program Celebrates its 20th Anniversary

In 1987 the foundations were laid for the wonderfully successful Stanford Medical Youth Science Program (SMYSP), which was envisioned, championed and brought to fruition by the dedicated leadership of Dr. Marilyn Winkleby, Professor of Medicine. On August 17-19th the 20th Anniversary of SMYSP was celebrated with workshops and a Reunion Banquet. Over these two decades, nearly 600 students have graduated from SMYSP, the vast majority of whom have graduated from college and now pursuing careers as health professionals. This is a truly remarkable accomplishment, and it offers evidence of what personal advocacy can accomplish and how lives can be changed as a consequence. Please join me in congratulating all the participants and graduates of SMYSP and especially its leaders, Dr. Winkleby and Judith Ned. Well done!

The Stanford Challenge and Medical Development 2006-2007

The Stanford Challenge (http://deansnewsletter.stanford.edu/archive/10_23_06.html) was publicly announced in October 2006, when more than half of the \$4.3 billion campaign goal had been raised. As I have previously discussed, the Stanford Challenge is unique among university fundraising campaigns in *Seeking Solutions* to some of the world's most pressing problems and in its goal of *Educating Leaders* who will address the future because they have been equipped with the skills and knowledge to meet important global challenges. Focused on three major themes (The Initiative on Energy and the Environment, the International Initiative, and the Initiative on Human Health), the Stanford Challenge is addressing problems in alternative energy sources and in creating a sustainable environment, is seeking solutions to global warming and global conflicts and security and is taking on the major health and biomedical research challenges of the 21st century. It is a commitment to transform Stanford and, through the knowledge, discoveries and insights gained, to help with important global issues.

On September 5th, I had the opportunity to address leading alumni and friends of Stanford at a Washington D.C. launch of the Stanford Challenge, held at the Phillips Gallery and hosted by Stanford University Trustee Vicki Sant and her husband Roger Sant, together with Stanford parents Jim Johnson and his wife Maxine Isaacs. I relayed to this group my conviction that Stanford is uniquely poised to take on these challenges. We are a relatively small research-intensive University, with world class schools of Business, Earth Science, Education, Engineering, Humanities & Sciences, Law and Medicine. In addition, we have an extraordinarily talented students and faculty who are highly entrepreneurial and willing to work across disciplines and take on big challenges – even

with the risk of failure. The campaign themes, *Seeking Solutions* and *Educating Leaders*, are in my view, wonderfully emblematic of Stanford in the 21st century.

At the D.C. launch, we also hosted a panel presentation on the challenges and opportunities in stem cell biology and regenerative medicine that featured Irv Weissman, Virginia & DK Ludwig Professor and Director of the Stanford Institute of Stem Cell Biology and Regenerative Medicine, and Hank Greely, Deane & Kate Edelman Johnson Professor of Law and of Genetics. The panel spanned the basic discoveries and opportunities emerging from research in stem cell biology along with the scientific, political, ethical and legal issues that challenge and confound this important new area of science and medicine. Thanks to our recent successes at Stanford and the important funding now flowing through the California Institute for Regenerative Medicine and fueling research and education in California, we were able to convey the exiting opportunities and prospects for the future. It did not escape the audience that similar research is not going on in Washington or most of the rest of the nation because of the restrictions placed on the NIH by the current Executive Branch and Congress – something that we all hope will change in the not too distant future.

Through our presentations and a vibrant discussion session we were able to convey the excitement that is taking place at Stanford as the Stanford Challenge continues to unfold. I am also happy to say that the School of Medicine and Medical Center have played an important part in the Stanford Challenge.

As most of you know, Stanford's fiscal years run September 1 through August 31st. One of the exciting accomplishments of the fiscal year that just ended is the continued progress in private fundraising for the medical center. I have been spending an ever-increasing amount of time and energy on development and am thankful to the many faculty who have lent their time and efforts to helping with our fundraising activities. We have also forged a close working relationship between the School and Stanford Hospital & Clinics, and the SUMC Executive Committee, led by John Freidenrich and Denise O'Leary, has been working diligently and collaboratively.

The continued growth, organization and effectiveness of our Office of Medical Development, led by Associate Vice President Douglas Stewart, have been vital to our efforts. Certainly most significant and exciting is that Doug reports that FY 2007 (September 1, 2006 – August 31, 2007) broke previous fundraising records by a considerable margin. Notably, for the School of Medicine and Stanford Hospital, combined new fundraising activity (new gifts and new pledges) exceeded \$270 million (compared with \$156 million last fiscal year, a previous record), and cash received (new gifts and pledge payments) exceeded \$188 million (up from \$115 million last fiscal year).

Especially noteworthy is the excellent progress we have made on capital projects for the School of Medicine, with several great gifts for the Learning and Knowledge Center, including a \$5 million commitment from Akiko Yamazaki and Jerry Yang and a \$4 million pledge from Professor Paul Berg and his wife Millie. For SIM-1, the first of our

Stanford Institutes of Medicine research buildings, progress has been substantial, led by Lorry Lokey's remarkable commitment of at least \$40 million. Wonderful anonymous donors to our stem cell program have contributed more than \$7 million last fiscal year. And just last week, our friends John and Regina Scully pledged \$20 million to the medical center, half to support stem cell research in SIM-1, and half toward the new Stanford Hospital construction. It is also exceedingly important that the Stanford Hospital efforts are gaining momentum with record new activity. I am also pleased to say that we have a number of very significant potential capital gifts in the pipeline and am optimistic that a number of these will come to fruition in the months ahead.

We saw a record number of new endowed professorships established this year, with many more in the pipeline. Among these are the Dorothy and Thye King Chan Professorship in Neurosurgery (now held by John Adler, Jr., MD), the Coyote Foundation Professorship (to be held by Gregory Albers, MD), the Allan and Tina Neill Professorship of Lymphatic Research and Medicine (to be held by Stanley Rockson, MD), and the Joan and Peter E. Haas, Jr., Professorship for Cutaneous Lymphoma Research (to be held by Youn Kim, MD). A number of key faculty leaders helped make these professorships a reality, including Drs. Frank Longo, Rich Hoppe and Gary Steinberg, among others. Nearly a dozen more endowed professorship gifts are in various stages of discussion and approval.

The School of Medicine is enjoying robust alumni support, as well. Among the highlights, Dr. Bob Cody, class representative for the MD Class of 1957, did a magnificent job of organizing his 50th year class reunion. In addition to rallying his classmates to attend, he also challenged them to each make a gift of at least \$2,500 to the school. The class responded with 44 gifts that totaled \$207,500, the largest class gift on record.

These achievements reflect not only the efforts of our Development Office staff and volunteer leaders, but also those of all of our faculty and staff across the medical center, who appreciate that philanthropy is critical to our growth and continued excellence. Thank you to all of you – most especially to the record number of donors who chose to support us this year. That said, we began a new fiscal year (FY08) on September 1st, and, as always, we started again at the beginning, with a blank slate but with lots of optimism for continued success in the year ahead!

Update on the Department of Bioengineering

Beginning at the September 7th Executive Committee Meeting, we reinstituted a program we conducted several years ago of having chairs provide updates on their departments' activities and challenges as a shared learning opportunity. I plan to provide summaries of those presentations in upcoming issues of the Dean's Newsletter. Following is the report prepared by Dr. Russ Altman, Professor of Bioengineering, Genetics and Medicine and, by courtesy, of Computer Science.

The Bioengineering Department is led by Russ Altman (Chair) and Steve Quake (Co-Chair). The mission of the department is "to create a fusion of engineering and the life sciences that promotes scientific discovery and the invention of new technologies and therapies through research and education." The Department is unique at Stanford in that it is part of both the Schools of Medicine and Engineering, reflecting the dual emphasis on both discovery and application. Administratively, all support for the department is shared equally by the two schools, including faculty billets, space, and financial support. The department research program is broad, but generally focuses on "translational bioengineering" in which basic sciences (particularly physics and chemistry) is translated into clinical applications or new research tools and technologies, using the principles of engineering.

The department currently has 15 full or joint appointees, 6 courtesy, 1 consulting, and 11 affiliated faculty. The anticipated equilibrium size is approximately 24 full appointees. The faculty boasts three NIH Pioneer Award winners (Steve Quake, Karl Deisseroth, Kwabena Boahen). Research foci include biomedical computation, biomedical imaging, biomedical devices, regenerative medicine/tissue engineering, and cellular and molecular engineering. The latest recruits in 2007 Markus Covert, Zev Bryant, and Annelise Barron. Taking another view of the department by application domain within medicine, there is strong representation in cardiovascular medicine, neuroscience, orthopedics, cancer, psychiatry/neurology, pharmacology and radiology.

The Bioengineering department has a close working relationship with the BioX program, as the departmental offices and many faculty are housed in the Clark Center and are committed to interdisciplinary research. The department hosts NIH training grants in regenerative medicine and biomedical computation. It also is the home of the NIH Roadmap National Center for Biomedical Computation focusing on physics-based simulation of biological structure (<http://simbios.stanford.edu/>). The department has a translational seed grant program, supported by the Wallace Coulter Foundation that is devoted to funding partnerships of clinicians and bioengineering faculty to bring technology to the bedside in time periods of one to five years.

Bioengineering has welcomed four classes of graduate students (roughly 15-20 per year), pursuing the MS and PhD degrees. These students are free to work with any Stanford faculty who can provide research opportunities relevant to bioengineering. The curriculum includes a core sequence, and then electives in the five research foci defined above.

Bioengineering faces three exciting and important challenges in the coming years.

1. Continued faculty growth. There is a strong interest in synthetic biology, physics-based modeling, joint appointments with clinical departments,

joint appointments with other engineering departments, and a strong interest in biomedical applications.

2. Creation of an undergraduate major (and, most likely, a minor) in Bioengineering. There is considerable interest among undergraduates in being dually trained in biology and engineering. These students in many cases are interested in research careers or careers in medicine. The department is defining a timeline for building up a curriculum, advising system, and research opportunities for undergraduates, with the goal of introducing a major in the next few years. The department will coordinate this program with other undergraduate programs, and will take advantage of Stanford's special strengths in both engineering and life sciences.
3. Aggressive development to support the departmental mission. As a new department, Bioengineering needs to articulate its mission and develop mechanisms to support the innovative research and education programs it is creating. Current priorities include student fellowships, support for the translational research seed program, and support for the planned Bioengineering/Chemical Engineering building as part of the new Science & Engineering Quad (SEQ) across Campus Drive from the medical school. In addition, the department is considering a small number of high impact research projects consisting of teams of bioengineering faculty and other faculty from the BioX program.

In summary, the Department of Bioengineering is in its fifth year. It is building on a very strong start recruiting a core faculty with stellar research credentials, and is now focusing attention on further recruitment, undergraduate and graduate curriculum development, and gathering resources to support these programs.

The School of Medicine is now a “Tobacco-Free Zone”

You have hopefully noticed the new “No Smoking” signs posted around the perimeter of the Medical School. I’m pleased to report that as of September 1st, the School of Medicine campus is now a “tobacco-free zone.” The purpose of this new “Tobacco Free Campus” policy is to further our commitment to promoting health and wellness. With over 400,000 deaths annually in the United States related to tobacco, not permitting smoking on our campus is an appropriate move towards improved health for all.

Importantly, the University has launched a campus-wide program to support smoking cessation and end tobacco use. On September 1, Stanford Benefits and the Health Improvement Program (HIP) started offering a new Quit Tobacco Program to benefits-eligible University faculty and staff and their dependents (age 14 and older). This program provides free educational and counseling support and a supply of nicotine patches or gum to help participants quit tobacco. Additional information about the Quit Tobacco Program can be found at:

<http://benefitsu.stanford.edu/Web%20site%20info-v4.pdf>

Another resource for smokers wanting to quit is our “Tobacco Free Campus” web site. Here you will find campus, local and national resources to help you stop smoking, as well as background information about the effects of smoking and tactics of the tobacco industry. I encourage you to visit the site at: <http://med.stanford.edu/tobaccofree>. Thanks to Kristin Goldthorpe, Project Coordinator in the Dean’s Office, for her efforts in making the new policy a reality.

Celebrating Dr. Lubert Stryer and Stanford

On Friday, September 7th friends and colleagues of Dr. Lubert Stryer, the Mrs. George A. Winzer Professor of Cell Biology, Emeritus, and Professor Emeritus of Neurobiology, gathered in the Dean’s Courtyard to celebrate his receipt of the National Medicine of Science which was announced earlier this summer (see: <http://med.stanford.edu/mcr/2007/stryer-0725.html>). This event was also a reminder of what makes universities like Stanford so great. In looking around at the guests, who included Nobel Laureates, previous National Medal of Science Awardees, and other extraordinary faculty from throughout the University, one could not avoid being impressed by the remarkably talented faculty who are at Stanford and who create the environment that fosters the success of students and each other. I was also reminded of how important faculty like Lubert Stryer have been to the development of the Medical School during the past nearly 50 years since the school moved to the Stanford campus. Dr. Stryer joined the Department of Biochemistry in 1963 at the invitation of Dr. Arthur Kornberg and was one of the pioneers who contributed to the vibrant education and research milieu that has characterized Stanford Medicine. He and his colleagues also contributed to and benefited from the entrepreneurial environment that has shaped Silicon Valley and Stanford in a mutually synergistic manner.

In his own reflections at the ceremony, Dr. Stryer commented on the important factors that characterized his own illustrious career and that represent significant challenges for the future. These include his love of science, his ability to excite and stimulate students and colleagues, and the unique interdisciplinary environment at Stanford, which forged collaborations throughout the medical school as well as with colleagues in chemistry, applied physics, engineering and SLAC and opened new vistas to discovery. Dr. Stryer and Andrea, his wife of 49 years, have been an integral part of Stanford (except for a seven year sojourn to Yale) and have deep personal and professional connections both here and in the local community.

But Dr. Stryer also expressed concern about three important issues. First, while he expressed deep appreciation for the doors of opportunity that were opened to him as an immigrant to the U.S. based on his hard work and achievements, he offered a concern – and hope – that the U.S. would continue to open its doors to immigrants and offer them the opportunities that have characterized his and past generations. Second, he expressed concern that the period of training for young scientists has become too lengthy and that independence as an investigator (as measured by the time to the first NIH award) is occurring later and later – a trend he hoped could be reversed. In tandem, he expressed

concern that the current climate of uncertain funding for biomedical research creates an inordinate pressure for grant writing and can blunt the most creative ideas from being pursued.

I want to again congratulate Dr. Stryer for his many accomplishments as a scientist and for the important role he has played as an educator and faculty member. We are so fortunate to have him at Stanford.

Living Lessons

Like so many others, I have found that many of the lessons I have learned in my own life come directly from living them. This past summer I was privileged to do one of my rotations as an Attending Physician on the pediatric infectious disease service. I have been doing this since I arrived at Stanford and have many reasons for wishing to do so even though it creates some havoc with my “day job.” Among them is that it not only affords me the opportunity to contribute to the care of seriously ill children and to play a role in the education of students and residents, but it also provides an opportunity to directly observe and participate in the inner workings of a leading teaching hospital. One of the important lessons and reminders I continue to take away from these experiences is how challenging and difficult the lives of clinical faculty and trainees can be. The many time demands, often extending deep into the evening hours and beyond, require considerable focus and energy. And because so many faculty, particularly those who are on the upward climb of their academic career, are deeply engaged in teaching and research as well, the personal and professional pressures can be enormous. I quite purposefully reflect on this while I am “on service” and try recalling this experience when I am reviewing faculty appointments for appointment or promotion. Thus my own experience provides a living lesson reality check on the pressures of life in an academic medical center.

I also had the experience this summer of witnessing the additional pressures that arise when faculty members have children to attend to as well. With my own children long grown, this summer brought our first grandchild. This has been a wonderful experience in its own right. But it is also an affirmation of the tremendous pressures faced by new parents who are seeking to balance career and family against the pressures of time, sleep deprivation and all the uncertainties of a new role hallmarked by life (and family) transforming dimensions. In taking the opportunity to learn on a personal basis from this new experience, I have renewed admiration for the ability of our faculty to balance so many features and dimensions of their lives. But I also recognized, once again, that many of the pressures fall more exclusively to women and young mothers. This underscores the importance and need for robust support systems, including childcare. I have written previously about the work underway by Dr. Hannah Valentine, Ellen Waxman and others to further improve our offerings in childcare. And while I would like to think that I have been highly sensitive and proactive in these important needs in the past, I am certain that this summer’s new “living lesson” will make me even more so on many dimensions in the future. Certainly these experiences are important on multiple levels – and I will endeavor to keep them so.

Awards and Honors

Myriam Curet, M.D., *Professor of Surgery and Associate Dean for Medical Education*, has been chosen to receive the Association of Women Surgeons' Olga Jonasson Distinguished Member Award. This award is given to a member surgeon who exemplifies the ideals and mission of the association. Congratulations to Dr. Curet!

Ron Rosenfeld, M.D., *Senior VP for Medical Affairs* has been selected to receive the 2008 Robert H. Williams Distinguished Leadership Award. This award is given by the Endocrine Society in recognition of outstanding leadership in fundamental or clinical endocrinology. He has also been selected as the 2008 Transatlantic Medalist by the Society for Endocrinology in the United Kingdom for his significant contributions to the discipline. Congratulations Dr. Rosenfeld!

Dave Hogness, M.D., *Rudy J. and Daphne Donohue Munzer Professor, Emeritus* has won this year's "International Prize for Biology" prize, awarded by the Japanese Society for Promotion of Science (JSPS) to an individual who "has made an outstanding contribution to the advancement of research in fundamental biology." The award ceremony will be held on November 19th in the presence of the Emperor of Japan. Congratulations Dr. Hogness!

Dr. James Chang, *Professor of Surgery (Plastic Surgery) and Chief of the Division of Plastic and Reconstructive Surgery*, was recently elected to the Board of Directors of the American Association for Hand Surgery. The purpose of the Association is to provide an educational forum to increase the professional expertise and knowledge of surgeons involved in hand surgery. Congratulations Dr. Chang!

Appointments and Promotions

- **Laurence Baker** has been promoted to Professor of Health Research and Policy, effective 9/1/07.
- **Jimmy Brown** has been appointed to Clinical Associate Professor (Otolaryngology - Head and Neck Surgery), effective 9/01/07.
- **Kenan Christopher Garcia** has been promoted to Professor of Molecular and Cellular Physiology, effective 9/01/07.
- **Kyle Harrision** has been promoted to Clinical Assistant Professor (Affiliated) (Pathology), effective 8/01/07.
- **Michele Kastelein** has been reappointed to Clinical Assistant Professor effective 9/01/07.
- **Hau Liu** has been appointed to Clinical Assistant Professor (Affiliated) (Medicine), effective 9/01/07.
- **Melanie Manning** has been promoted to Clinical Assistant Professor (Pathology) effective 8/01/07.

- **Vibha Mohindra** has been promoted to Clinical Assistant Professor (Affiliated); (Medicine), effective 9/01/07.
- **Friedrich Moritz** has been reappointed to Clinical Assistant Professor (Affiliated) (Pathology), effective 9/01/07.
- **Vyjeyanthi Periyakoil** has been reappointed to Clinical Assistant Professor (Medicine), effective 9/01/07.
- **Pavi Prasad** has been promoted to Clinical Assistant Professor (Pathology), effective 9/01/07.
- **Mary-Anne Purtill** has been promoted to Clinical Assistant Professor (Surgery), effective 7/01/07.
- **Jeanne Rosner** has been reappointed to Clinical Assistant Professor (Pathology) effective 9/01/07.
- **George Triadafilopolous** has been reappointed to Clinical Professor (Medicine), effective 9/01/07.
- **Volney Van Dalsem III** has been appointed to Clinical Associate Professor (Radiology), effective 9/01/07.
- **Kirsti Weng** has been reappointed to Clinical Associate Professor (Affiliated) (Medicine), effective 9/01/07.
-

Dean's Newsletter **September 24, 2007**

Welcome to Our 2007 Graduate Students

This week we welcome our 2007 incoming class of graduate students. This outstanding group of 101 aspiring PhD students—who were selected from an applicant pool of 1365 applications - will be studying in our 12 departmental and interdisciplinary programs. In addition to the remarkable academic credentials and promise of each individual in this incoming cohort, I am pleased to note that 16 of the 101 are members of underrepresented minority groups. Our faculty and students are committed to enhancing the diversity of our community as the best way to achieve excellence in our individual and collective experiential knowledge and cultural enrichment. In addition to the incoming Biosciences students, we are also pleased to welcome the 17 students who are beginning in the PhD program in the Department of Bioengineering, our joint department of the Schools of Engineering and Medicine. Taken together the Biosciences and Bioengineering students represent the future lifeblood of Stanford's extraordinary research enterprise, and I am most pleased to welcome each and every one of them to our Stanford community.

Stanford is the University for Pioneers

Without question, what contributes to the uniqueness of Stanford University and serves as among the most distinguishing features of the Medical School is the excellence and accomplishments of its discovery based basic scientists. This has been the case since the Medical School moved to the Stanford campus nearly 50 years ago - and it has continued

to this moment. There are many ways of demonstrating the remarkable discoveries and innovations of our research faculty (e.g., high impact publications, patents, awards and honors). One emerging and highly visible measure is the number of NIH Pioneer Awardees at Stanford compared to peer institutions. Since NIH began issuing the Pioneer Awards four years ago to recognize true innovations in basic research, Stanford faculty have received nearly 20% of the awards – more than any other university. This figure is even more remarkable given the relatively small size of our faculty. The trend continues in 2007 as a result of the announcement by NIH Director Elias Zerhouni on September 18th of the 2007 Pioneer Award winners. Among the 12 awardees were Tom Clandenin, Assistant Professor of Neurobiology, and Mark Schnitzer, Assistant Professor of Biological Sciences and Applied Physics (see: http://med.stanford.edu/news_releases/2007/september/pioneer.html). With these awards, Stanford faculty now hold 9 of the 46 Pioneer Awards! This is truly a remarkable accomplishment, and it is clear evidence of the creativity and accomplishments of our faculty.

Importantly, the nine Stanford NIH Pioneers come from different disciplines and Schools (H&S, Bioengineering and Medicine) and thus further affirm the talents and strengths of our faculty across the biological, physical and engineering sciences. Drs. Clandenin and Schnitzer join previous Stanford Pioneer winners: Steve Quake (Bioengineering), Karl Deisseroth (Bioengineering and Psychiatry), Tom Rando (Neurology-VA), Pehr Harbury (Biochemistry), David Relman (Medicine/ID-VA), Kwabana Boahen (Bioengineering) and Karla Kirkegaard (Microbiology & Immunology) - truly a broad and deep spectrum of talent.

Given our prominence in the Pioneer competition it is not inappropriate to think of Stanford as the University for Pioneers!

Performance, Professionalism, Promotion

On September 19th the Medical School Faculty Senate approved the formation of a new Committee on Performance, Professionalism and Promotion (aka CP3). Led by Senate Chair Sherry Wren, Professor of Surgery, this committee will play an important role in providing oversight and guidance for all Stanford medical students. The stated purpose of the CP3 is “to provide all medical students with periodic and systematic review of their overall progress towards completion of the MD degree, as well as reviews on an as-needed basis. The committee will monitor student development and will provide guidance, recommendations and remediation as appropriate.”

Given the selectivity for admission to the School of Medicine there can be no question that our primary goal is to provide the very best education for all of our students and to work with them, individually and collectively, to be as successful as possible. While we are successful in nearly all situations, from time to time students encounter difficulties, and it is important to be clear and transparent about what our expectations are from an institutional perspective. Accordingly, the CP3 policy notes “Stanford Medical School has an obligation to evaluate the performance of each student on an ongoing basis from

matriculation until graduation with an MD degree, and to endorse each student as being suitable in terms of meeting the academic, professional, and technical standards for the practice of medicine.”

In practice the CP3 will be composed of 12 voting members who are broadly representative of the School’s expertise in basic and clinical sciences. All students will be reviewed on an ongoing basis to assure that they have fulfilled the stated academic, technical and professional standards such that plans for promotion or remediation are delineated. In the very rare circumstances where these standards are not met, the criteria for dismissal are also delineated.

The new policy was discussed and endorsed by the Stanford Medical Student Association prior to its presentation to the Faculty Senate. With the unanimous approval of the Senate, the policy will be broadly circulated to all students and will be available on the Faculty Senate website (<http://med.stanford.edu/senate/>). In my opinion, the new policy on Performance, Professionalism and Promotion is an important step in bringing clarity and transparency to the assessment of all students and serves both their best interests as well as the institutional responsibility of the School. I am very appreciative to Dr. Sherry Wren for her leadership and for the input that came from faculty and students to help shape and refine this important new policy and committee.

Good News on Quality Performance at SHC

The Leapfrog Hospital Quality and Safety Survey is one of the measures used to assess how well hospitals and physicians are doing in meeting quality standards and how they compare with each other in various standardized metrics. On September 18th the Leapfrog Group announced the 2007 “Top Hospital” list based on the 1285 hospitals that responded to the Quality and Safety Survey. The list included 33 adult facilities and 8 children’s hospital. Stanford Hospital and Clinics (SHC) is included in this “Top Hospital” list – which is great news and is a tribute to the partnership among the Hospital, Medical School and medical staff leadership. Coupled with this news is the publication of an improved ranking of SHC on quality metrics by the University HealthSystem Consortium.

The Leapfrog survey and the UHC quality assessment are among numerous rating systems being used to assess hospital and physician performance.

Ranking in the Leapfrog system is based on achieving progress in four areas:

1. ***Computerized Physician Order Entry***: Do physicians enter patient prescriptions and other orders into computers linked to error prevention software?
2. ***ICU Physician Staffing***: Are intensive care units staffed by trained ICU specialists (intensivists)?
3. ***Evidence-Based Hospital Referral***: How well do hospitals perform seven high risk procedures and care for three high-risk neonatal conditions?
4. ***Leapfrog Safe Practices Core***: How well are hospitals progressing on the other 27 National Quality Forum-endorsed Safe Practices?

Without question a focus on high quality and patient service must go hand-in-hand with providing the best medical care. While this is the right thing to do for its own sake, it is also the case that measures of quality will be increasingly used to rank and assess hospitals and physician performance, and the results will more and more be made available to the public. Moreover, public and private payers are beginning to use these performance measures to determine pay for service. While this trend in assessment and payment is becoming a standard, it is also important to note that the measures used are not always precise or even as evidence based as one might hope or believe. But they are being employed, and it is essential that we pay attention to them. As you know from past communications (see: http://deansnewsletter.stanford.edu/archive/03_12_07.html#2) the school has forged close relationships with both SHC and LPCH to “shine a bright light focus” on quality, as I delineated in my July 9th Dean’s Newsletter (see: http://deansnewsletter.stanford.edu/archive/07_09_07.html#4). To further our efforts, the Medical Staff, School and SHC will hold a Quality Summit on October 27th that will further shape our plans, goals and commitment to continue our trajectory of improvement in providing the highest quality care possible.

Handwashing – From Semmelweis to SHC

I recently learned that, despite our progress on a number of patient quality measures (see above), observations from a number of sources indicate that handwashing practices are deficient at SHC– by physicians, nurses, trainees, etc. I must admit I find this shocking. I am well aware that consistency of handwashing has been a longstanding problem in hospitals, ever since the seminal observations of Ignaz Semmelweis in the 19th century that handwashing and hygiene reduced the incidence of puerperal fever. In fact, the failure and unwillingness of the medical establishment to adopt his recommendations ultimately led Semmelweis to have a nervous breakdown (although this is debated). Nonetheless, the data that handwashing reduces the transmission of microorganisms are unassailable, and, given the rising incidence of antibiotic resistant staph and streptococci, it is essential that all providers wash their hands prior to direct contact with any patient. While there was a time when this was difficult because of the lack or location of sinks, it is now easy to accomplish with the ready availability of hand cleansers outside every patient room. In fact there can be no excuse for not doing hand cleansing prior to patient contact. It is incumbent on each of us to be vigilant and to remind individuals failing to cleanse their hands between patient contacts to do so. This is an essential practice and simply must be done.

Message from SHC Regarding Transcription

The Stanford Hospital & Clinics Health Information Management Service asked me to provide the following information to you regarding the dictation and transcription project.

“Stanford Hospital and Clinics is preparing to transition to Spheris to provide its dictation and transcription services. Originally, we said you would learn the new system and begin using its online editing and electronic signature functions this summer. We will implement these features; however, we will wait to roll them

out when we launch the Epic Clinical Information System (CIS) in February 2008.

You will dictate letters and other documents as you previously have. HIMS will provide you with paper documents for editing and your signature. Clinics will continue to mail final documents. Documents will be electronically sent to Carecast. Once Carecast is replaced by Epic, documents will be sent to Epic for electronic signature and viewing from the patient record.

For the Spheris rollout, clinics and specialty care areas will still be grouped by their existing transcription vendor. Spheris will go live as each vendor is retired. The revised rollout schedule is included with this memo. Training required for Spheris will be simplified to cover just those functions that will change in the short-term, including:

- New phone number: ext. 233 inside the hospital; 800-242-9770 from outside the hospital
- Use the patient's entire, 8-digit, medical record number
- One additional identifier, speak the "Visit" number or "Encounter" number

You will receive a brochure with instructions to aid in training.

Please watch other SHC communications for Spheris updates, including Medical Staff Update".

Bicycles and Pedestrians – Sharing the Road

A number of facilities projects are underway, with more to come in the next several months. As you know, the plans to build the Learning and Knowledge Center (LKC) and the Stanford Institutes of Medicine 1 (SIM1) have resulted in the closure of a large number of parking spaces – with further loss of parking imminent in the weeks ahead. This loss of parking has facilitated the ongoing "Connectivity Project," which is re-routing utilities and creating tunnels and related infrastructure to support the School's Master Facility Plan that will unfold in the next 10-15 years. The end result will be an exciting and transformed medical school campus. But getting there is filled with challenges. One of these is the need to use more remote parking (at Stockfarm or Roth) and is coupled with our efforts to reduce car trips overall on campus. The good news is that many more faculty, students and staff are now using bicycles instead of cars to get to work. This is something we want to encourage and to see increase over time. But there is a bad news part as well.

With increased numbers of cyclists and the construction projects underway, both bikers and pedestrians are competing for the same lanes and paths. While this is inevitable, an observation and concern registered by many is that bikers are moving all too quickly on

congested road and are being less attentive to pedestrians. This has led to some near accidents and angry encounters. Because the numbers of bikers are likely to increase, I want to call on them – and others – to be as careful and thoughtful about safety as can be. Even though lanes are marked and caution signs in place, pedestrian anxiety and complaints are increasing. We have engaged the University bicycle coordinator to provide advice on how to mitigate the current problem. For now we are calling on voluntary behavior to pay increased attention to safety. Should that not resolve the problem the only recourse will be to have bikers walk their bicycles while on share pedestrian lanes. To avoid this I would like to alert you to the problem and ask for your help and assistance in assuring the safety of pedestrians and cyclists. Thank you.

Medical Development Results Even Better Than Reported

In the September 10th Deans Newsletter I happily reported that we had achieved record results in medical development (philanthropy) for the 2006-07 academic year (see: http://deansnewsletter.stanford.edu/archive/09_10_07.html#3). While the results reported were outstanding, it turns out that they did not include several important gifts that arrived between August 28th - August 31st. Indeed, during that period the Office of Medical Development recorded an additional \$15.9 million in cash for the School, of which \$13.7 million was new gifts and pledges. That makes the School of Medicine and SHC combined new gifts and pledges for FY07 \$284.6M (compared to \$156M in FY06), and the combined cash for FY07 \$204.4M (compared with \$115.3M for FY06). For the School of Medicine alone, the new gifts and pledges for FY07 is \$246.4 million (compared to \$145.7 million for last year) and the cash received is \$198.1 million (compared to \$107 million for FY06). Truly these are remarkable results – making our challenge for FY08 all the greater – but worth striving for!

In my September 10th report I also did not give the breakdown for medical development dollars received in partnership with the Lucile Packard Children's Hospital and the Lucile Packard Foundation for Child Health. According to Chris Dawes, President and CEO of LPCH, the new gifts and pledges for the both the School and LPCH totaled \$74,503,103 for FY07 and grants from the Children's Health Initiative to the School and LPCH for FY07 totaled \$31,913,805 – also a remarkable set of results totaling \$106,416,909.

Again I want to thank the Office of Medical Development and the LPFCH staff as well as our faculty and hospital partners for an incredible effort and remarkable results. Now on to FY08!

Healthcare for Children

A recent Gallup Pole of the images of 25 business and industry sectors shows that the healthcare industry is among the lowest rated with a 28% positive rating – which places only slightly above the federal government (21%) and the oil and gas industry (19%). Moreover, were it not for the Iraq War, it is likely that healthcare would be among the most important, if not *the* most important, current issue to Americans. As we all know from the presidential debates and commentaries, healthcare reform features prominently

in both the issues raised by voters and the plans proposed by candidates. While most of the proposals strive to increase health insurance coverage, none of them are bold – likely fearing the catastrophic events that surrounded the 1994 efforts at healthcare reform. Among the issues at the heart of the debate is the balance between the private and public sector in providing healthcare coverage. These issues are playing out on a state level as well as in the federal government and, so far, regardless of the sentiments, motivations or perspectives, no real plan seems likely to move forward, at least until there is a change in leadership in 2008.

But there is a debate that will take place in the next week that focuses on the provision of healthcare to poor children through the program called SCHIP (State Children's Health Insurance Program), which was launched in 1997 and which has won broad bipartisan support in the states as well as the Congress. But SCHIP is destined to expire at the end of the month unless it is reauthorized. Currently it seems likely that the House and Senate could reach a reconciliation on proposals that have achieved broad support (more so in the Senate than the House) but the White House has made it clear that it intends to veto the bills that seem likely to come forward. Several issues obtain, but among them is the Administration's insistence that health care is better provided by the private sector than the government. At risk is that poor children will be left without healthcare if the President is successful with a veto. While I am sensitive to the multiple views about healthcare, I strongly believe that the attempts to derail SCHIP are truly irresponsible since they have an impact on a population that has no voice and that cannot speak out except through advocates. If you are interested, a balanced perspective on this issue was recently published in the September 6th issue *New England Journal of Medicine* by John K Iglehart entitled "The Battle over SCHIP" (see: <http://content.nejm.org/cgi/reprint/357/10/957.pdf>). At this point we can only hope that the Congress will garner enough votes to override a presidential veto. For the sake of poor children, one can hope that this is achieved.

Tobacco and UC

You may recall my report in the April 9th Dean's Newsletter on Tobacco, Human Health and Academic Freedom (see http://deansnewsletter.stanford.edu/archive/04_09_07.html#1) and my commentary on Promoting Health (http://deansnewsletter.stanford.edu/archive/05_21_07.html#1) that led us to ban smoking on the medical school campus. Central to the initial debate was whether the university should ban the acceptance of research support from the tobacco industry. This question resulted in a rigorous discussion and debate in the University Senate, where concerns about infringement on academic freedom and the potential for creating a precedent for a "slippery slope" that could impact other academic policies and freedoms led the Senate to vote against a proposition restricting acceptance of research funding from the tobacco industry. A not dissimilar debate has also been taking place throughout the University of California system with seemingly similar polar views being expressed about whether to accept or deny funding from the tobacco industry. While most consider the tobacco industry particularly egregious in its longstanding practices, the UC Regents, like the Stanford Senate, recently voted to reject a ban on receiving

tobacco funding. But the UC policy includes the provision that research proposals involving tobacco-industry funding will have to be evaluated by a special scientific review committee prior to accepting the funding. This committee will verify that the study “uses sound methodology and appears designed to allow the researcher to reach objective and scientifically valid conclusions,” among several other provisions.

While the debate about tobacco industry funding seems destined to continue and to garner both proponents and opponents, it seems more important to focus our energies on doing all we can to encourage smoking cessation and the promotion of health. This is the direction we have decided to pursue at the Stanford University School of Medicine.

Update on the Stanford Institute for Immunity-Transplantation-Infection (ITI)

On Friday, September 21st Dr. Mark Davis, Burt and Marion Avery Professor and Director of the ITI, gave an update to the Executive Committee on the progress being made by the ITI. Following is a summary of the presentation that has been prepared by Dr. Davis.

"The ITI is led by Mark Davis (Director), Carlos Esquivel (Associate Director) and Paul J. Utz (Associate Director for Education). Its mission is to promote interactions and develop programs that take advantage of the explosive growth in knowledge about the immune system, infectious diseases and transplantation in order to realize the inherent synergies between these areas and quicken the pace towards curing some of the most serious diseases of our time. Over 300 Stanford faculty have expressed an interest in these efforts and seventy are currently registered as members. The Institute has pursued a multi-pronged strategy towards fulfillment of its mission: Aiding and enabling existing multidisciplinary centers within these areas and creating new ones, forming "working groups" that will be the incubators of new strategies in the approach to key problems, innovative educational programs and creating reduce new facilities that empower Stanford researchers to make quantum leaps in patient care and in our understanding of diseases.

Centers

Two very innovative and successful centers at Stanford predated, set the stage for ITI and now constitute vital parts of it. These are the Center for Clinical Immunology at Stanford (CCIS) started by Garry Fathman in 1994 and the Stanford-LPCH Vaccine Program, started by Ann Arvin and Harry Greenberg in 1997. CCIS has been instrumental in bringing together and supporting clinical immunologists and others across many specialties and in developing new educational programs. It has also had a national impact in that it spurred the creation (also led by Garry) of the Federation of Clinical Immunology Societies (FOCIS) which pools the knowledge of 22 separate clinical organizations. The Vaccine Program has been a vital resource in the infectious disease/ vaccine area, bringing together many Stanford researchers in those areas and particularly spearheading a major NIAID-funded effort to discover the immunological basis of protective influenza vaccines, so that we can replicate the successes in this area to the many other urgent needs we have for other vaccines. A vital component of this center is

the excellent clinical expertise of its Medical Director, Corry Dekker and her staff, without whom many important studies would not be possible. In addition to these important enterprises, last year the ITI approved the establishment of a new entity, the Center for Hepatitis and Liver Regeneration, headed by Jeffery Glenn. Hepatitis is an important, world-wide cause of both acute and chronic liver disease, liver cancer, and Hepatitis C in particular is the single major cause of liver failure necessitating transplantation in the US. Since the need for transplanted livers is much greater than the supply, the center is actively engaged in both finding a cure for Hepatitis C and in developing ways to regenerate failing livers or "grow" new ones. Recently Dr. Glenn has obtained permission to initiate a clinical trial of a promising new drug for Hepatitis C, and this, if successful, would be a major breakthrough in this area.

Working groups

Working groups are an important way in which Stanford faculty and their students can meet and focus their efforts on devising new approaches to a particular disease or opportunity to advance the science behind one or more diseases. We see them as key "incubators" in which knowledge across the whole spectrum of biomedical science, from basic science to clinical care, can be pooled and collaborations established to tackle the biggest problems. ITI has started a number of working groups, specifically in Transplantation Tolerance (led by Sam Strober), Hepatitis C (led by Jeffrey Glenn), Inflammation after Surgery (Martin Angst), Rheumatoid Arthritis (Bill Robinson) and the Infection and Immunity Database Project (Amar Das). Many more are in the works and suggestions from the community are welcome. Some support for these groups will be available this year as will be "seed" grant funding for the most promising projects.

Human Immune Monitoring Center and Core Facility

One of the most important endeavors of ITI, in close collaboration with Garry Fathman and the CCIS, has been the planning, fundraising and now the opening of the Human Immune Monitoring Center (HIMC) under the leadership of David Hirschberg. This facility has been operational in temporary quarters since the beginning of the year and is just now moving into its newly renovated quarters in the CCSR building, just in time for its official opening next week. This unique facility is laying the groundwork for a revolution in medicine and human immunology and infectious disease. It takes clinical samples (mostly blood) and analyzes them with state-of-the-art instrumentation that can measure thousands of markers simultaneously to obtain a real time "picture" of that individual's immune system and any infectious diseases that might be present. This data, together with the expertise that the center offers, will enable clinical investigators across many disciplines to obtain detailed information on each patient enrolled in a particular trial, and help them to identify new markers that will aid in understanding that particular disease and devising better treatments. An important innovation of this facility is that the data on all the analyses performed will be pooled into a broader database that will enable researchers to look across many diseases, as well as data from normal volunteers, in ways that will greatly accelerate the search for common mechanisms and treatments. This facility has been made possible by a generous donation from the HEDCO Foundation as well as grants from the Russell Foundation, the Sidney Frank Foundation and from the

Becton-Dickenson Corporation. We are also very grateful for the support we have received from the Dean's office.

Education

Eight years ago, Paul (PJ) Utz started what is now an extremely successful summer program of instruction and immunology laboratory experience for talented high school students under the sponsorship of CCIS. ITI has now joined with CCIS in expanding this effort to encompass infectious diseases as well and this will also be the template for similar efforts in the other Stanford Institutes of Medicine that PJ is coordinating. This year ITI was also pleased that PJ accepted our offer of a position as Associate Director for Education at ITI and we look forward to both his continuing efforts with the expended summer program as well as other initiatives that will benefit the many other kinds of students within ITI.

Development

Philanthropic support has already proven to be crucial to ITI's progress, particularly in the creation of the HIMC. With the heroic efforts of June Lang and Michael Welch in the Office of Medical Development we have formed Campaign Council to intensify our fundraising efforts so that we can do even more to support the important work here.

Future

ITI is still in its relative infancy and thus we are particularly looking forward to ways in which we can facilitate translational science at Stanford. We especially look forward to these developments in future years:

Seed Funding for working groups and innovative projects: This year for the first time we will be able to provide seed funding for innovative proposals in ITI's core areas. We expect that this will provide further impetus for collaborations and working groups in that it will allow them to try out new strategies and obtain the preliminary data needed for larger scale funding from the NIH. ITI will also be able to provide scientific support for grant writing through our program officer and logistical support through our program manager.

Further development of the HIMC: This coming year will see the continuing evolution of the HIMC, with the implementation of our database strategy and the development of new assays to assess immune function. Eventually we expect that the Stanford HIMC will be a model for similar facilities across the country and the nucleus of a "genome project" scale international effort to use immunological and infectious disease markers to better define human health and ameliorate or cure at least some of the many diseases with an immunological component.

Symposia: In the coming year ITI will sponsor two important symposia, one on "Immune Monitoring" in the fall (Dec. 13-14) and another on "Basic Mechanisms of Infection and Immunity" in April of next year (April 24-25, 2008). Both of these events will highlight the contribution of Stanford faculty in these areas as well as bring in outstanding investigators from other institutions.

I want to thank Dr. Davis for his report and also the members of the ITI for their contributions.

Events

- ***Former President of India APJ Abdul Kalam*** (2002-2007) visited Stanford on September 18th to both celebrate and give an update on the Stanford-EMRI (Emergency Management Research Institute), which was launched at an official signing on May 9th. Dr. Kalam described his commitment to this impressive education and emergency rescue project, which emanated from the dedicated efforts of Drs. SV Mahadevan, Assistant Professor of Surgery (Emergency Medicine), and his colleagues in Emergency Medicine, including Drs. Matthew Strehlow, Gregory Gilbert, Peter D'Souza and Alice Chao in collaboration with Venkat Changavalli, CEO of EMRI. This project began in Hyderabad, India and is planned for implementation throughout the country. It could very well be a prototype for providing emergency services to many developing nations. The goal of EMRI is to save a million lives a year – a target they seem destined to meet. In addition to hearing the progress reports on EMRI, it was a privilege for all who attended a special reception to hear the words of former President Kalam – an inspirational and much admired visionary leader.
- ***Dorothy and Thye King Chan Professorship for Dr. John Adler***, Professor of Neurosurgery: On Friday September 14th we celebrated the appointment of Dr. John Adler, distinguished neurosurgeon and inventor of the CyberKnife, among other innovations, as the first incumbent of the Dorothy and Thye King Chan chair, which was made possible thanks to the generosity of the Chan family as well as support from Gary and Victoria Reed. Please join me in congratulating Dr. Adler for this honor.
- ***Dr. Joe St. Geme, III delivered the 2007 Dr. Norman Kretchmer Lectureship*** on Friday, September 21st. He was the 11th Kretchmer Lecturer, which is named in honor of a remarkable leader in American Pediatrics, who also served as the chair of pediatrics at Stanford from 1959-1969. Dr. St. Geme, III is Professor and Chair of Pediatrics and of Molecular Genetics and Microbiology at Duke University. He is also a Stanford University alum with a distinguished academic career as well as an Academic All American football player.
- ***The First Comprehensive Cancer Research Training Program (CCRTP) at Stanford*** was held from September 16-21st at the Quadrus Conference Center. Over 170 postdoctoral fellows, clinical fellows, residents and graduates students attended a highly successful program that was made possible through the efforts of Drs. Karl Blume and Amato Giaccia (see http://cancer.stanford.edu/features/research_news/documents/CCRTP2007Syllabus.pdf). For those unable to attend, the entire program will be on-line in the next weeks.

Awards and Honors

Dr. David Hogness, Rudy J. and Daphne Donohue Munzer Professor in the School of Medicine, Emeritus, was selected by the Japan Society for the Promotion of Sciences as the recipient of the 2007 International Prize for Biology in recognition of the significant contributions he has made to the field of genetics. Dr. Hogness will travel to Japan where on November 19th he will receive the award in the presence of the Emperor of Japan. Congratulations to Dr. Hogness!

Upcoming Event: Fall Forum

Fall Forum on Community Health and Public Service

Tuesday, October 9th

5:00 – 7:30 pm

McCaw Hall, Arrillaga Alumni Center

Fall Forum was created by medical students to highlight and disseminate student work in the community. Since the forum's inaugural year in 2002, it has expanded to showcase a wide range of service and partnership research projects undertaken by Stanford medical students, undergraduates and physician assistant students in underserved communities here and around the world. The event is coordinated by medical students and sponsored by the Office of Community Health (OCH). The Fall Forum is free and open to the community. We generally have a large and diverse audience including alumni, community members and partner organizations, faculty and staff. Students present their work via posters and/or oral presentations, community partners are recognized for their contributions, and the event concludes with our keynote speaker address.

The keynote speaker for this year's forum will be Dr. Mimi Doohan, Stanford Medical School alumna. Dr. Doohan practices full-spectrum family medicine in Santa Barbara, both in her own private practice and in association with the practice of Dr. Ayesha Shaikh, OB-Gyn. Dr. Doohan is Co-Founder of Doctors Without Walls (DWW), a Santa Barbara non-profit, and serves as the organization's Vice President and Director of Unsheltered Services. DWW's mission is to provide volunteer medical care to the homeless and most vulnerable, where and when they are in need.

Appointments and Promotions

Seth Ammerman has been reappointed to Clinical Associate Professor (Pediatrics), effective 9/01/07.

Bernetta Avery has been appointed to Clinical Assistant Professor (Affiliated) (Pediatrics), effective 8/01/07.

Richard Bales has been appointed to Clinical Associate Professor Emeritus (Affiliated) (Psychiatry and Behavioral Sciences), effective 7/01/07.

Patrick Barnes has been promoted to Professor of Radiology, effective 9/01/07.

Maria Pilar Bernal has been promoted to Adjunct Clinical Associate Professor of Psychiatry effective 7/01/07.

Laura Brodzinsky has been reappointed to Clinical Assistant Professor (Obstetrics and Gynecology), effective 9/01/07.

Zhen Cheng has been appointed to Assistant Professor (Research) of Radiology, effective 9/01/07.

Kenneth Christensen has been appointed to Clinical Assistant Professor (Pediatrics), effective 9/01/07.

Tara Cornaby has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07

Ramesh Daggubati has been appointed to Clinical Assistant Professor (Affiliated)(Medicine), effective 8/01/07.

Cynthia L. DeTata has been promoted to Clinical Assistant Professor (Obstetrics and Gynecology), effective 9/01/07.

William F. Fearon has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 10/01/07.

Robert Filer has been promoted to Adjunct Clinical Assistant Professor of Ophthalmology effective 7/01/07.

Neil Friedman has been promoted to Adjunct Clinical Associate Professor of Ophthalmology effective 1/01/08.

Natasha Funck has been promoted to Clinical Assistant Professor (Affiliated) (Anesthesia), effective 7/01/07.

Louise Furukawa has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Alan Green has been promoted to Clinical Professor (Pediatrics), effective 9/01/07.

Paul Helgersen has been promoted to Clinical Assistant Professor (Medicine), effective 9/01/07.

Paul Hwang has been promoted to Clinical Assistant Professor (Pediatrics), effective 9/01/07.

Samina Iqbal has been reappointed to Clinical Assistant Professor (Medicine), effective 9/01/07.

Ethan Jackson has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Komal Kamra has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Jean Kohn has been reappointed to Clinical Assistant Professor (Pediatrics), effective 9/01/07.

Calvin Kuan has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Michaela Liedtke has been appointed to Assistant Professor of Medicine (Hematology) effective 9/01/07.

Ludwig Lin has been appointed to Clinical Associate Professor (Anesthesia), effective 8/01/07.

Steve Lindley has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Veterans Affairs Palo Alto Health Care System, effective 9/01/07.

Yiming Lit has been promoted to Clinical Assistant Professor (Medicine), effective 7/01/07.

Paul K. Mahabir has been reappointed to Clinical Assistant Professor (Medicine), effective 8/01/07.

Kevin Malott has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Gail A. Prichard has been reappointed to Clinical Assistant Professor (Psychiatry and Behavioral Sciences), effective 9/01/07.

Nilima Ragavan has been reappointed to Clinical Assistant Professor (Pediatrics), effective 9/01/07.

Wendye Robbins has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/01/07.

Lisa Schmelzel has been promoted to Clinical Assistant Professor (Radiology), effective 8/01/07.

John B. Shinn has been reappointed to Clinical Professor (Otolaryngology - Head and Neck Surgery), effective 9/01/07.

Bindya Singh has been appointed to Clinical Assistant Professor (Affiliated) (Pediatrics), effective 9/01/07.

Anne Elizebeth Stuart has been promoted to Clinical Associate Professor (Pediatrics), effective 9/01/07.

Michael Taymor has been promoted to Adjunct Clinical Associate Professor of Pediatrics effective 5/01/07.

Shreyas Vasanawala has been appointed to Assistant Professor of Radiology, effective 9/01/07.

Eric A. Weiss has been promoted to Associate Professor of Surgery (Emergency Medicine), effective 9/01/07.

Mark L. Welton has been promoted to Professor of Surgery (General Surgery), effective 9/01/07.

Gail Wright has been reappointed to Clinical Assistant Professor (Pediatrics), effective 7/01/07.

Paul Zei has been appointed to Clinical Assistant Professor (Medicine), effective 8/01/07.

Dean's Newsletter

October 8, 2007

Should the Medical Student Curriculum be a Flexible Five?

When the School of Medicine moved from San Francisco to the Stanford University campus in 1959, a new program for medical student education called the “*Five Year Plan*” was launched. Students were accepted to the medical school with the expectation that they would spend five years in a flexible blend of course work, clinical rotations and research. Some entering students who had not yet completed their undergraduate degrees were able to take courses in other parts of the university along with their medical school curriculum. Within a short time the Stanford University School of Medicine became distinguished as a center for education and training for aspiring physician-scientists. The education programs were seen as unique, and generations of outstanding academic leaders were trained, many of whom are still in leadership positions in academic medical centers across the nation. Over the years the program morphed into a “flexible curriculum” and the “Five Year Plan” lapsed even though a majority of Stanford students spent more than four years completing their MD degrees – a pattern that continues today.

In the Fall of 2003 we launched the *New Stanford Curriculum*. It features a blending of basic science and clinical medicine into a more streamlined and optimized course sequence consisting of Foundations of Medicine, Human Health and Disease and the Practice of Medicine, plus a set of “Scholarly Concentrations” that include didactics, mentoring and research. When the curriculum was being revised we had considerable discussion about whether to reinstate a required five-year program but decided to continue it as a four- to -five -year (or longer) course of study and research. In retaining the option to complete the MD degree in four years we were acutely aware that accomplishing a “Scholarly Concentration” of value and significance would be difficult in four years. Now that four years have passed since the initiation of the *New Stanford Curriculum* it is time to reconsider whether we are on the right path or whether we should move more intently to a required five-year program.

Because this is an important issue with many ramifications and consequences, I am interested in soliciting comments and feedback from you about your thoughts and recommendations. I have broached this important topic with groups of students and, at our Executive Committee on Friday, October 5th, I asked Dr. Charles Prober, Senior Associate Dean for Medical Student Education, to lead a discussion on it. As background, Dr. Prober reported that more than 70% of students pursuing an MD degree (exclusive of MD-PhD graduates) spend 5 years at Stanford before graduation. On average, students spending five years were more likely to receive research grants than those who completed their MD in four years (83% vs. 66% respectively) and had more publications (53% vs. 22%). But these are best seen as trends only since the data are limited and not rigorously analyzed.

There is no question that our shared goal is to provide the very best education we can for our students. And for those pursuing an MD degree there should be no doubt that we have a unique focus and goal. We wish to train tomorrow’s leaders across the domains of medicine and science and, in doing so, to optimally utilize and engage the unique resources available at Stanford University. We are fortunate in having outstanding applicants, and the students who join our program are unique. Accordingly, we want our education programs to be flexible enough to accommodate the variegated backgrounds and goals of each student. Many enter with advanced degrees, others seek combined degrees once arriving at Stanford, and many others only begin formulating their future career trajectories during their initial years as medical students. Further, we are fully committed to seeking the most diversified student population possible, since we believe this enriches the overall educational experience and permits us to educate students who are multidimensional and who will serve a wide range of institutions and communities.

The question is whether our students can optimally achieve the educational goals and the opportunities available at Stanford in less than five years, given the importance of the Scholarly Concentration to their individual development. Currently students are pursuing a range of Scholarly Concentrations including: Bioengineering (29 students), Biomedical Informatics (6 students), Biomedical Ethics & Humanities (26 students), Clinical Research (44 students), Community Health (41 students), Health Services & Policy (12

students), Molecular Basis of Medicine (30 students) and Independent Study (3 students). In addition, a number of students are also exploring their Scholarly Concentration in defined applications including: Cardiovascular/Pulmonary (19 students), Immunology (14 students), Neuroscience (17 students) and Women's Health (12 students). While there is no doubt that our medical students are highly talented, the issue is whether they can gather in-depth experience in their Scholarly Concentrations while still fulfilling all the other requirements for an MD degree.

A range of opinions, reflections and recommendations came forth in the discussion at the Executive Committee about whether we should have a mandatory five-year MD program at Stanford. The distillate of that dialogue is that we should have a "Flexible Five Year Program." That is, we should make it clear that we believe that to optimally benefit from the Stanford experience, medical students should ideally plan to spend five years. Of course this is exclusive of those pursuing an MD-PhD, who by definition will spend more than five years. That said, we fully recognize that a required five years would not be appropriate for some students, and thus we would prefer to consider our MD program as a Flexible Five Year Program. For example, a number of students may have already done an advanced degree or have had considerable prior research experience and may be eager to begin their future careers. Others may find that their individual goals are better satisfied with four years of study – even though this will not permit optimization of their overall experience. Importantly, our discussion brought forth concern that a mandatory five year program might discourage highly talented students from applying to Stanford simply because they hadn't yet had the opportunity to define their future career paths. Most notably there was concern that a mandatory five-year program could negatively impact on the broad diversity our medical student body.

Given these important considerations, I would like to frame our current views as supportive of a *Flexible Five Year Program*. In such a program we would encourage most students to take a full five years of study (or more if necessary) and we would work out the funding accordingly. However, we would be flexible for students for whom five years is either unnecessary or incompatible with their needs and goals. I am interested in your thoughts about this issue as well.

What You Can Do About SCHIP

On October 3rd, as many of you know, the President vetoed the SCHIP bill (State Children's Health Insurance Program), which had achieved broad support from Congress. In doing so he drew a line in the sand on whether medical care should be privately or publicly funded. Sadly the line was drawn over children, most lacking health care insurance, whose voices will not be heard but whose lives may be adversely impacted. Some 10 million children would benefit from SCHIP, a program that has achieved considerable success since it was instituted in 1997 and that has wide bi-partisan support in Congress as well as among state governors.

Two issues are at the heart of the veto: first, the view that SCHIP represents an expansion of government supported medical care compared to privately run health care and second, the fact that it would be funded in part by a tax increase on cigarettes. Clearly these frame

the larger debate on health care that is currently drawing national attention, due largely to the increasing costs of health care and the perceived need to reform the health care system. But the routes to reform are excessively driven by powerful constituencies. These include: the insurance, pharmaceutical and device industries; hospital associations and medical professional groups; political leaders; industries for whom the burden of health care costs have become increasingly onerous; citizens for whom health insurance is unaffordable or inadequate; and a public that has not fully come to terms with the true costs for the care they receive and that has expectations that may not always be compatible with either good or affordable medical care. These forces will shape the health care debate that will surely unfold during the upcoming presidential elections and that will figure prominently in the domestic agenda of the next administration.

Any health care reform in the USA will require compromise and is likely to be incremental – even though major revisions are needed. All that said, is it appropriate to take a position that compromises some 10 million children when the child health bill the President vetoed was approved in the Senate by 67 to 29 and in the House by 265 to 159? While there are sufficient votes in the Senate to override the veto, this is not the case in the House of Representatives – where approximately 15 votes are needed. Regardless of where one falls on the health care debate, from my personal point of view it is not appropriate to act on one's views in a way that compromises children. This view was well expressed by the medical and resident staff at Stanford and at the Lucile Packard Children's Hospital in a rally that was led by Dr. Lisa Chamberlain, Assistant Professor of Pediatrics, and that has helped to organize pediatricians and children's hospitals across the nation (see: <http://news-service.stanford.edu/news/2007/october3/med-schip-100307.html>) under the banner of "Stand Up for Children."

You can help make your voice heard to Members of Congress on behalf of children who cannot do so. If you wish to do and desire more information on SCHIP you can find it at <http://www.childrenshospitals.net/nach/schip>. If you are willing to write your Member of Congress you can do so by going to: <http://capwiz.com/nach/issues/alert/?alertid=10383886&type=CO>. Under action alert enter your ZIP code (for students and those who have out of state residences, use that address) and then send a personalized message. It will just take a couple of minutes and it can make a big difference in assuring that you are heard – both on behalf of yourself and our nation's children.

Big Steps Forward for Stem Cells and California

This past week featured some giant steps for stem cell research in California. On October 2nd, State Treasurer Bill Lockyer called for individuals to participate in the \$250 million dollar bond sale approved by California voters in November 2004 under the California Stem Cell Research and Cures Act, or Proposition 71. As you know, the implementation of Prop 71 was held up by legal challenges that were, thankfully, dismissed this summer. With that, the California Institute for Regenerative Medicine (CIRM) is set to become the world leader in supporting and fostering stem cell research. If you are interested in

buying stem cell bonds you can get additional information at www.buycaliforniabonds.com.

The issue of the bonds and the recent selection of Dr. Alan Trounson as the new president of CIRM helped make the October 5th meeting of the Independent Citizens Oversight Committee (ICOC), the 29 member board on which I have served since its inauguration nearly three years ago, a more ebullient event. The ICOC has worked diligently to create and develop the infrastructure to support the highest quality stem cell research possible. Thanks to interim funding from bond anticipation notes and advanced support from the Governor, the ICOC has already funded 136 training and research grants to institutions throughout California – and for which Stanford has competed in a highly successful manner. With the issuance of the bonds, new grant programs are forthcoming, including ones for the development of new pluripotent human stem cell lines as well as for support of multi-disciplinary teams of scientists in pursuit of therapies for specific diseases. CIRM will begin soliciting applications for planning grants later this fall. If you are interested, information is available at http://www.cirm.ca.gov/meetings/pdf/2007/100307_item_9.pdf. The intent of the planning grants is “to provide relatively modest sums to scientists who will enlist team members to help prepare research and management plans for major, long-term grants for translational research leading to clinical trials” (see http://www.cirm.ca.gov/meetings/pdf/2007/100307_item_8.pdf). The much larger disease grants will be funded in late 2008. In addition to these important new grant programs, major facilities construction grants are currently being prepared by institutions, including Stanford, and will be reviewed early next year.

Clearly stem cell research is moving forward on multiple fronts, making this an exciting and important time for California – and as a consequence for the nation.

New Policy on Faculty Searches

Perhaps the most important activity we conduct to enrich and renew the excellence of our faculty is to select them through rigorous and thoughtful search processes. This past year Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, chaired a Task Force on Faculty Searches that examined a number of important issues related to the faculty search process. It recommended that the Office of Academic Affairs develop a single, comprehensive document that would include School and University policies and processes relating to faculty searches; guidelines on search committee membership and responsibilities; best practices in the areas of advertising, outreach and networking activities; findings regarding unconscious bias; and current data on faculty demographics.

Based on that, a new issued Guide to Faculty Searches is now available online. Among the important changes are guidelines on reducing the length of the search process and on the composition of the committee. To further assure that searches yield the greatest degree of diversity, departments are encouraged to name one member of the search committee as the diversity officer. The overarching goals of the new Guide are to assure that searches:

- are conducted with integrity and transparency
- are thorough and comprehensive
- use all resources available to ensure and maintain a diverse candidate pool
- move expeditiously and systematically
- respect confidentiality
- provide candidates with access to information
- leave all involved with a sense of fairness
- provide the requisite information and administrative flexibility to enable a final decision by the department and a smooth appointment process
- result in the recruitment of an outstanding candidate who will flourish as a member of the Stanford Community and bring distinction to the School and University.

I am grateful to Dr. Stevenson and to Assistant Dean Judith Cain for their efforts as well as to all those who provided input on the format and content of the *Guide to Faculty Searches*. I encourage you to share your ideas with us about how we can make it the best possible resource for your search and recruitment activities. If you have any questions or comments feel free to direct them to Assistant Dean Cain at jpcain@stanford.edu.

NIH and the Continuing Resolution

I want to bring to your attention to the notice just published by the National Institutes of Health (NIH) that details how non-competing grants will be treated under the current continuing resolution. At this time Congress has yet to clear any of the fiscal year 2008 appropriation bills and accordingly agencies have been working under a continuing resolution (CR) since October 1st, the start of the federal government's fiscal year. The current continuing resolution is set to expire on November 16th. As it did in FY 2006 and 2007, NIH announced it will fund most non-competing awards at 80 percent of previously committed levels while it operates under the CR. When NIH receives its appropriation for fiscal year 2008, these awards will be adjusted. In FY 2007, once the final appropriations bill was enacted, NIH funded non-competing awards at an average of 97.1 percent of previous committed levels (or 2.9 percent below committed levels). If you are interested, the details of the NIH announcement are available at <http://grants.nih.gov/grants/guide/notice-files/NOT-OD-08-001.html>.

Time to Register for Epic Training

On March 1, 2008, Stanford Hospital & Clinics will be going live with the new CIS-Epic electronic health record. All faculty and physicians are required to receive Epic training prior to that time. To register, go to <http://sumlms.stanfordmed.org/sumtotal> and follow the instruction to log into the LMS and complete the short tutorial. Your username is your dictation number. Your initial password is your *last name* – you will be prompted to change it when you log in for the first time. If you need help registering for LMS, stop by the registration kiosk in the SHC cafeteria on Mondays, Wednesdays, and Fridays anytime between 7 a.m. and 3 p.m. Learning Services staff members will be there to assist you. If you need a personal appointment or have a question, e-mail them at

CISLearningServices@stanfordmed.org.

I strongly encourage you to begin your training early. It will be a problem if you wait until the last minute – and if you haven't registered by February 29, 2008 you will not be able to practice medicine at SHC. Thank you for your cooperation.

Stanford Clinical Trials Registry

Beginning Friday, November 9, 2007 all clinical trials conducted at Stanford and affiliated facilities must be registered in a single, comprehensive and publicly accessible database, the Stanford Clinical Trials Web Site. The web site, developed and hosted by the School's Office of Information Resources and Technology (IRT), will be used to gather descriptive information about our trials for publication on other Stanford web sites and for automatic uploading to the NIH-operated site

This web site will provide appropriate, real-time descriptive information about all clinical trials conducted at Stanford, thus serving as a convenient central resource for investigators, research personnel, administrators, sponsors, study subjects, and the general public. This will include all trials where Stanford is the lead sponsor.

The following information regarding the Stanford Clinical Trials Web Site has been issued by the Stanford Packard Center for Translational Medicine (SPCTRM):

Why is this needed?

Ever increasingly the web is used by patients and referring physicians as the primary mechanism to learn about clinical trials. To date, finding comprehensive information about studies at Stanford has been extremely difficult. By providing a single, easy to use web site with information about all trials at Stanford, this system will provide a means for the public to more easily discover our studies.

In addition, in 2005, the International Committee of Medical Journal Editors (ICMJE) initiated a policy requiring investigators to deposit information about trial design into an accepted clinical trials registry before the onset of patient enrollment. This policy aimed to ensure that information about the existence and design of clinically directive trials was publicly available. Response to the policy has been overwhelming with over 40,000 trials registered by April 2007 and with more than 200 new trial registrations now occurring each week. But as clinicaltrials.gov has grown, its utility as a means of disseminating information about clinical trials being conducted at Stanford has waned; thus the need for a comprehensive, Stanford-specific clinical trials database.

Which studies must be registered?

In accordance with the policies of the ICMJE, Stanford requires registration of any research study that prospectively assigns human participants or groups of humans to one or more health-related interventions to evaluate the effects on health outcomes. Health-related interventions include any intervention used to modify a biomedical or health-related outcome (for example, drugs, surgical procedures, devices, behavioral treatments,

dietary interventions, and process-of-care changes). Health outcomes include any biomedical or health-related measures obtained in patients or participants, including pharmacokinetic measures and adverse events. Purely observational studies (those in which the assignment of the medical intervention is not at the discretion of the investigator) will not require registration.

Those who are uncertain whether their trial meets this definition should err on the side of registration. After November 9, investigators must be able to affirm that a qualifying trial has been registered prior to enrolling any patients. In addition, failure to register qualifying trials prior to patient enrollment makes that study ineligible for publication in an ICJME journal (e.g., *Annals Internal Med*, the *Lancet*, *JAMA*, *NEJM*, and many others).

ALL new clinical trials meeting the ICMJE definition above, including Phase I trials, must be registered. As preparation for the public launch on November 9, SPCTRM and IRT have pre-loaded into clinicaltrials.stanford.edu all Stanford trials that currently exist on clinicaltrials.gov, so there will be no need to re-register those studies. However, between October 18 and November 9, investigators and coordinators whose trials are not cancer studies should login to clinicaltrials.stanford.edu to verify the accuracy of the information and provide any missing data. Detailed instructions will be provided at the October 18, 2007 workshop (see below) and are available from SPCTRM. [Please note that the Cancer Clinical Trials Office will continue to perform all web site-related tasks for all cancer studies.]

What this means for you:

- The ability to simultaneously publish trials in a centralized directory available from the School's home page and on any Departmental/Divisional School of Medicine web site.
- Added recruitment value for potential research participants and investigators.
- One-stop entry for both clinicaltrials.stanford.edu and clinicaltrials.gov
- Greater visibility for both internal and external viewing of clinical research being conducted at Stanford.

How to Learn More:

Attend one of the two Training Presentations that will be held on the following dates:

- *Friday, October 12, 2007, 12-1:30pm in CC2103-2105:* This program is only for those with cancer studies.
- *Thursday, October 18, 2007, 12-1:30 pm in the Clark Center Auditorium:* This program is for investigators, coordinators and administrators whose studies **do not** involve cancer research.

Who Can Help? The SPCTRM office will be the primary administrator to facilitate this process. Please contact Linda Walker at 498-7425 or linda.walker@stanford.edu with any questions about trials that do not involve cancer research.

The Cancer Clinical Trials Office (CCTO) is providing registration services for all cancer trials. For questions or assistance on cancer study registration, contact Ellen DiNucci, CCTO Recruitment Specialist at 725-2839 or oredinucci@stanford.edu.

Faculty Fellows Program

Dr. Hannah Valentine, Senior Associate Dean of the Office of Diversity and Leadership, has announced the launch of the 2008 School of Medicine ***Faculty Fellows Program***. Now commencing its third year, this extraordinarily successful program will welcome a select group of Assistant and Associate Professors as Faculty Fellows for the 2007-08 academic year. The purpose of the Faculty Fellows program is to identify and develop a diverse group of junior faculty who have the potential to become our future leaders.

During the year-long program, Fellows will attend a monthly dinner with key University leaders such as President John Hennessey and Dean Philip Pizzo. Fellows will engage in discussion with these individuals about leadership philosophy, strategy and style—“Personal Leadership Lessons.” Fellows will interact in discussion with colleagues and explore their own ideas on how to address leadership challenges as their careers develop. On a monthly basis they will also meet in small groups with a senior Professor, who will be their mentor. They will be guided in a Development Planning process to engage with their own division chiefs or department chairs in crafting and executing a personal career development plan.

We invite all Department Chairs or Chiefs to submit nominations. If you are interested in being nominated for this opportunity, ask your Department Chair or Chief or Dr. Hannah Valentine to nominate you.

Nominees should be Assistant or Associate Professors who have demonstrated interest in and potential for leadership roles in the School of Medicine. They should be respected by their colleagues and should have demonstrated an ability to influence others. In addition, they should be advocates for change and for increasing the diversity of the School of Medicine. They should have demonstrated the ability to think strategically and systemically, and should be interested in taking on leadership roles in the future. Fellows are expected to attend all dinner meetings and mentoring group meetings.

You may obtain a nomination form by contacting Jennifer Scanlin at jscanlin@stanford.edu or at 5-0052. Nominations are due by November 21, 2007. The new Fellows class will be announced in January, 2008 and will begin meeting in February.

Recent Events

- ***Opening of the Immune Monitoring Center:*** On Wednesday September 26th, we celebrated the official opening of the Stanford Human Immune Monitoring Center, an innovative and important resource being provided by the Stanford Institute for Immunity, Transplantation and Infection. The Center has been made

possible by a generous gift from the HEDCO Foundation along with the Sidney E. Frank Foundation and the Russell Family Foundation. It will provide a broad array of immunological, genomic and other studies as a means of characterizing the plethora of human diseases that may have a primary or secondary immune component or dysfunction. The original concept for the center was stimulated by Dr. Gary Fathman, Professor of Medicine and has been supported by Dr. Mark Davis, Director of ITI and the Burt and Marion Avery Professor of Microbiology and Immunology. Dr. David Hirschberg serves as the Director of the Center.

- ***Welcome Breakfast for New Faculty:*** On September 24th I joined Drs. David Stevenson and Hannah Valentine in welcoming faculty who have joined the School of Medicine during the past year. This served as an opportunity for new faculty to meet each other and learn more about the Stanford community. In welcoming them I encouraged each of them to embrace and utilize the resources available across this incredible university. I also encouraged them to focus on the big issues and questions that could be transformative – and that could help to transform Stanford and our community, locally and globally.
- ***Visit from Shantou University School of Medicine.*** On October 1st and 2nd we hosted a delegation led by the Provost and Dean from the Shantou University and its School of Medicine in China, along with senior representatives of the Li Kai-Shing Foundation. This provided an opportunity to share our efforts in medical and graduate student education as well as interdisciplinary research in medicine and bioengineering. It was an extremely fruitful exchange and I am particularly grateful to Alan Yeung, Professor of Medicine, who has played an important role in our interactions with Shantou University and the Foundation. We each learned a lot from the other. I also want to thank the faculty and students from Stanford who contributed their valuable time to make this visit so successful.
- ***Digestive Disease Center Annual Retreat.*** On Saturday September 29th, Dr. Harry Greenberg, Senior Associate Dean for Research and Training and Professor of Medicine, hosted the annual Digestive Disease Center Retreat. Held in the Clark Center Auditorium, the Retreat brought leading faculty and trainees from around the nation to an excellent scientific exchange. Part of the program consisted of presentations by the 2007 DDC Pilot Awardees, including Dr. Ting-Ting Huang, Assistant Professor of Neurology and Neurological Sciences, Dr. Rajat Rohatgi, Postdoctoral Fellow, Department of Medicine (Oncology) and Dr. Steve Galli, Professor and Chair of the Department of Pathology.
- ***The Center of Excellence,*** which has played an important role in helping to foster diversity through programs in education, mentoring and community service, gathered to thank the faculty and students who have made such important contributions during the past year(s). While the federal government has unfortunately canceled the funding for this program, its leaders will seek ways to continue its important efforts at Stanford. Dr. Fernando Mendoza along with Drs. Ron Garcia and Gabe Garcia, among others, played pivotal and important roles in

making the Stanford COE so successful over the years, and I am very appreciative of their efforts.

Upcoming Events

Dr. Audrey Shafer asked me to alert you to two important upcoming events:

The Jonathan King Lecture will be given by Arthur Caplan, PhD from the University of Pennsylvania on Wednesday October 10th at 5 pm in the Clark Center Auditorium. The title of Dr. Caplan's presentation will be "*Show No Mercy? The Ethics of Access to Experimental and Novel Treatments.*"

Music and Medicine: An Interactive Concert and Lecture by Robert Kapilow and the St. Lawrence String Quartet entitled "*From Sickness to Health: Narrative in Beethoven's Heiliger Dankgesang*" will be held in the Clark Center Auditorium on Tuesday October 30th at 6 pm.

Awards and Honors

- The Institute for Health Policy Studies in conjunction with the Office of the Chancellor and Dean at UCSF held a Symposium to celebrate the 35th anniversary of the Center and to honor **Dr. Philip Lee** for his remarkable career and extraordinary contributions in medical education and health policy during his distinguished leadership positions at UCSF and in the federal government. Dr. Lee has also been an important teacher in Human Biology and is one of the most important figures in American Medicine. I was pleased to witness part of his wonderful and well-deserved celebration.
- **Dr. Oscar Salvatierra, Jr.**, Professor of Surgery and Pediatrics, Active Emeritus and Advising Dean for the School of Medicine, will be honored as the 2007 recipient of the Albion Walter Hewlett Award at Medical Grand Rounds on Wednesday, October 17th in the Braun Auditorium. The Hispanic Business Magazine ranked Stanford as the second best medical school in the nation (behind UT Southwestern Medical Center) for educating and training Hispanics.
- **Dr. P. Joanne Cornbleet**, Associate Professor Emeritus in the Department of Pathology, is one of six individuals who were honored on October 1st with the 2007 College of American Pathologists Lifetime Achievement Award.
- **Dr. James F. Fries**, Professor of Medicine has been named a 2007 Honorary Fellow in the Society for Public Health Education in celebration of his lifetime contributions in public health and health education.

Congratulations to all!

Appointments and Promotions

- **Janelle Aby** has been promoted to Clinical Associate Professor (Pediatrics), effective 10/1/07.
- **Fred Ackroyd** has been appointed to Clinical Professor (Affiliated) (Surgery), effective 9/1/07.
- **Manuel R. Amieva** has been reappointed to Assistant Professor of Pediatrics and of Microbiology & Immunology, effective 10/1/07.
- **Joanna Badger** has been reappointed to Clinical Assistant Professor (Dermatology), effective 10/1/07.
- **Stephen Baccus** has been reappointed to Assistant Professor of Neurobiology, effective 10/1/07.
- **Andrea Cervenka** has been promoted to Clinical Assistant Professor (Affiliated) (Medicine), effective 11/1/07.
- **Alan G. Cheng** has been appointed to Assistant Professor of Otolaryngology – Head and Neck Surgery, effective 10/1/07.
- **Glenn Chertow** has been appointed to Professor of Medicine (Nephrology), effective 10/1/07.
- **K.S. (Casey) Crump** has been appointed to Clinical Assistant Professor (Medicine), effective 10/1/07.
- **Corinna Darian-Smith** has been promoted to Associate Professor of Comparative Medicine, effective 10/1/07.
- **Glen R. Elliott** has been appointed to Clinical Professor (Affiliated) (Psychiatry and Behavioral Sciences), effective 10/1/07.
- **Neal B. Frager** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Edward E. Graves** has been reappointed to Assistant Professor of Radiation Oncology, effective 11/1/07.
- **Peter Gregor** has been promoted to Clinical Assistant Professor (Affiliated) (Medicine), effective 9/1/07.
- **Liliana Hamlett** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Shoshana Helman** has been promoted to Clinical Assistant Professor (Affiliated) (Medicine), effective 9/1/07.
- **Bradley Hill** has been reappointed to Clinical Assistant Professor (Affiliated) (Surgery), effective 10/1/07.
- **Ting-Ting Huang** has been reappointed to Assistant Professor (Research) of Neurology and Neurological Sciences, effective 10/1/07.
- **Michele Hugin** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Evaleen Jones** has been promoted to Clinical Associate Professor (Medicine), effective 9/1/07.
- **Kathleen Kenny** has been reappointed to Clinical Assistant Professor (Medicine), effective 9/1/07.
- **Calvin Kuo** has been promoted to Associate Professor of Medicine (Hematology) effective 11/1/07.

- **Lawrence Kwan** has been promoted to Clinical Assistant Professor (Affiliated) (Medicine), effective 8/1/07.
- **Peter Lee** has been reappointed to Clinical Assistant Professor (Affiliated) (Medicine), effective 9/1/07.
- **Laura McClellan** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Bohdan Makarewycz** has been appointed to Clinical Assistant Professor (Affiliated) (Otolaryngology - Head and Neck Surgery), effective 9/1/07.
- **Yvonne A. Maldonado**, has been promoted to Professor of Pediatrics (Infectious Diseases), effective 10/1/07.
- **David B. Miklos** has been reappointed to Assistant Professor of Medicine (Blood & Marrow Transplantation and Immunology & Rheumatology), effective 10/1/07.
- **Ahn T. Nguyen** has been promoted to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Lily Nguyen** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Song L. Nguyen** has been promoted to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Mark R. Nicolls** has been appointed to Associate Professor of Medicine (Pulmonary & Critical Care Medicine and Immunology & Rheumatology), effective 9/1/07.
- **Seiji Nishino** has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/1/07.
- **Ruth O'Hara** has been promoted to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/1/07.
- **Dushyant Oza** has been reappointed to Clinical Assistant Professor (Pediatrics), effective 9/1/07.
- **Pankaj J. Pasricha**, has been appointed to Professor of Medicine (Gastroenterology & Hepatology), effective 10/1/07.
- **Thomas N. Robinson**, has been promoted to Professor of Pediatrics (General Pediatrics) and of Medicine (Stanford Prevention Research Center), effective 10/1/07.
- **Julien Sage** has been reappointed to Assistant Professor of Pediatrics (Cancer Biology) and of Genetics, effective 11/1/07.
- **Vanila Singh** has been reappointed to Clinical Assistant Professor (Anesthesia), effective 9/1/07.
- **Mamta Thukral** has been promoted to Clinical Assistant Professor (Anesthesia), effective 9/1/07.
- **Michelle Young** has been reappointed to Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/1/07.
- **Nancy Yuan** has been promoted to Clinical Associate Professor (Pediatrics), effective 8/1/07.
- **Maria Zelenko** has been promoted to Clinical Assistant Professor (Affiliated) (Psychiatry and Behavioral Sciences), effective 10/1/07.
- **Gary Zhao** has been promoted to Clinical Assistant Professor (Affiliated) (Medicine), effective 9/1/07.

Dean's Newsletter

October 22, 2007

October 26, 2007 Bulletin

Dear Colleagues:

It is with deep sadness that I write to inform you of the passing today of our friend and colleague, **Dr. Arthur Kornberg**.

As you know, Dr. Kornberg was a giant in his field. He was the winner of the 1959 Nobel Prize with Severo Ochoa for their work on DNA polymerase. He will be surely remembered as one of the most distinguished and remarkable scientists of the 20th Century. In fact, his towering contributions to science continued virtually up until the time of his death.

He is a legend at Stanford - and beyond. In 1959, he came to Stanford University as the chair of the new Department of Biochemistry. It was a time of great change, as the school was moving from San Francisco to Palo Alto, aspiring to become a great research institution. Dr. Kornberg brought his entire department at Washington University to Stanford, and in a short time it was acclaimed as the premier biochemistry department in the nation.

Nobel Laureate Professor Paul Berg, his friend and colleague, remarked on his passing, "There have got to be tens of thousands of people around the world today whose eyes are tearing up with the news that he's gone. He was an extraordinary scientist. His accomplishments might be called legendary. The style in which he did his science was inspirational."

Of course at Stanford we also know and celebrate his son Professor Roger Kornberg, winner of the 2006 Nobel Prize in Chemistry, and will want to extend our personal sympathies to him. Arthur Kornberg is survived by his wife, Carolyn Frey Dixon Kornberg, three sons and eight grandchildren. In addition to Roger, his sons are Thomas Kornberg, PhD, professor and vice chair of biochemistry and biophysics at the University of California at San Francisco, and Kenneth Kornberg, a noted architect and founder of Kornberg Associates.

The burial arrangements are private. Stanford University will host a celebration of Dr. Kornberg's life and legacy; details of this event will be released as they become available. In lieu of flowers, the family requests that contributions be made to the Dr. Arthur Kornberg Memorial Research Fund at Stanford University School of Medicine or to a charity of their choice. Arthur Kornberg Memorial Research Fund contributions can be sent to:

Stanford University
Office of Medical Development
2700 Sand Hill Road
Menlo Park, CA 94025

Additional details about the life and legacy of Dr. Kornberg along with a Guest Book are available at a special SOM

website: http://med.stanford.edu/special_topics/2007/kornberg/

Without question the name Arthur Kornberg will be associated with excellence in science and medicine for many many generations to come. We will miss him but we will always remember him.

Philip Pizzo

Updating the Trustees on School of Medicine Diversity Programs

On October 8th Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership and Professor of Medicine, presented an update to the University Board of Trustees on the status of the School of Medicine's efforts to further enrich the diversity of our student and faculty community and to promote leadership and career development. As a medical school community we are committed to improving our educational and research opportunities by fostering and supporting as diverse a community as possible. This includes the recruitment and retention of diverse faculty, students, trainees and staff who are representative of the communities in which we work and live. This commitment has led Dr. Valantine and her colleagues to establish a series of strategic goals, and I am pleased to say that they have made progress in each. Their goals and accomplishments include the following:

1. **Goal: Develop and monitor policies, strategies and resources for the recruitment of a diverse faculty.**
 - a. *Accomplishments include:* The Office of Diversity and Leadership (ODL) has become increasingly engaged with faculty search committees. As a result, the search process, composition of search committee itself and applicant pool and short lists are being enriched with a greater diversity of candidates. This increase is aided by outreach and personal contacts and the use of existing data bases for women and underrepresented in medicine minority candidates. In addition, a "Search Tool Kit" has been developed that addresses such topics as the issue of unconscious bias as it relates to faculty searches and interviewing recommendations and guidelines.
2. **Goal: Develop and monitor policies, strategies and resources for the retention of a diverse faculty.**
 - a. *Accomplishments include:*
 - i. Faculty development workshops that address grant writing, preparation of scientific publications, negotiations and the processes involved in "Appointments and Promotions" – with the objective of making these processes as transparent and understandable as possible.
 - ii. Research Awards to foster faculty diversity or to promote career development and balance for women faculty (including the newly formulated McCormick Award for junior faculty).

- iii. Attention to the facilitation of flexible work arrangements, childcare and community building events.

3. Goal: *Identify and develop individual leadership potential at an early stage of faculty careers and develop a menu of leadership opportunities that become available to meet individual needs.*

- a. *Accomplishments include* the School of Medicine Faculty Fellows Program, which was launched in February 2006 and which provides a forum for junior faculty to learn leadership skills and benefit from mentoring, coaching and career planning assessment. To date 30 faculty have enrolled in the Faculty Fellows Program, of whom 50% have been women and 25% underrepresented minorities (URM). Approximately 25% of the Faculty Fellows have come from basic science departments. The participating faculty have been nearly evenly split between Assistant and Associate Professors.

One of the outcomes of this program I am most pleased with is the community building that is fostered among the Fellows, who come from different basic science and clinical science disciplines and departments and who learn from and teach each other in the Program. Equally impressive is the fact that the senior faculty members who serve as mentors in the program and who come from both basic research and clinical departments, are equally effective – and engaged – in guiding basic and clinical faculty, thus underscoring how we can truly be one community of excellence.

- b. In addition to the Faculty Fellows Program the School has partnered with Stanford Hospital & Clinics (SHC) in a Physician Leadership Program that seeks to build skills in quality improvement as well as provide opportunities for network building. To date 56 faculty have graduated from the School of Medicine-SHC program. The 2007-2008 program is focusing on division chiefs and chairs of smaller departments. In addition, a number of the Pediatric Faculty have participated and benefited from the leadership training programs being sponsored by the Lucile Packard Children's Hospital.

We have seen progressive changes in our faculty demographics over time – and in particular since the inauguration of our Office of Diversity and Leadership. During this period 55 new faculty were appointed to the School of Medicine, including 17 women and 4 URM, resulting in net increases in women and minorities. While admittedly a small step, it is measurable progress that reflects the efforts of department chairs and faculty across the School. True, we have a distance to travel – but it is also true that we are making progress along the way.

For additional information on the Office of Diversity and Leadership and its various activities I would encourage you to visit its [new website](#). I particularly want to bring to

your attention the fact that Dr. Valentine and Dr. Claudia Morgan, Associate Director of ODL, are currently soliciting nominations for the next Faculty Fellows Program, which will begin in February, 2008. Faculty must be nominated by their division chiefs or department chairs. Nomination information may be found at the ODL web site. I encourage interested faculty to seek nomination to this fine program.

Although the data and comments I have presented above and in prior communications focus on faculty and students, I do want to underscore that we are equally committed to assuring diversity among our staff as well. At a recent Dean's Staff meeting, Ms Cori Bossenberry, Director of Human Resources for the School of Medicine, provided an update on the 2,416 individuals who comprise the "non-academic staff", 76% of whom are women and 32% a self-identified minority (ethnicity was not defined in 28% of the total). We are fortunate in having a largely stable and dedicated staff with an average turnover of approximately 400 individuals. The reasons for turnover vary but are primarily relocation, career change or advancement, a return to school or an inadequate salary. In response to exit survey questions most departing staff indicate that they experienced positive relationships with co-workers and enjoyed the teaching, learning and research environment of the university. Notably, nearly 80% indicate that they would recommend employment at Stanford to others. While these are encouraging findings, it is important for us to put as much effort as possible into promoting an environment that fosters staff development and retention and that values men and women equally as well as individuals from the broad spectrum of socioeconomic and ethnic backgrounds.

Pediatrics Mentoring Program Launched

Dr. Christy Sandborg, Professor of Pediatrics, Director of the Child Health Research Program (CHRP) and Interim Chief of Staff at LPCH, has let me know that the Department of Pediatrics recently launched its 2008 Pilot Pediatric Mentoring Program (PPMP). This one-year pilot, which was conceived by the Career Development Subcommittee of CHRP, is dedicated to the academic success and career-development of thirty-five Assistant Professors and Instructors in the Department of Pediatrics. A key component of the program is an eight-member "stable of mentors" who are supplemental to the mentees' primary mentors. Each mentor is loosely assigned one of four development areas: Clinical/Teaching, Research, Work/Life Balance, and Academics. The program is funded by the Department of Pediatrics, CHRP, the School of Medicine, and the Lucile Packard Foundation for Children's Health. The mentors will work with the planning committee going forward to develop tools for the program. Mentors and mentees will take pre and post program surveys as part of the program's performance measurement.

The PPMP planning committee consists of Dr. Christy Sandborg, Linda McLaughlin, Mary Chen, Dr. Hannah Valentine, and Pam Grier. More information can be found at <http://med.stanford.edu/chrp/PPMP.html>. This initiative promises to be an excellent addition to the career development activities for junior faculty in Pediatrics, and I look forward to hearing more about it in the months ahead.

Clinical Quality Improvements, Programs and Challenges

I have called attention in recent Newsletters to our commitment and focus on quality performance and its importance to our current and future success as an academic medical center (http://deansnewsletter.stanford.edu/archive/09_24_07.html#4, http://deansnewsletter.stanford.edu/archive/03_12_07.html#2). Like our efforts to improve diversity and enhance leadership, improving quality performance will be an ongoing effort. We will be judged and compared to our peers locally and nationally, and patients will almost certainly choose whether to come to Stanford on how well we do on national metrics and norms. As I have also noted, performing simply to the metrics or public standards, while important, is insufficient. Thankfully, a number of efforts are underway – at the Medical Center level as well as by departments and groups of faculty and staff. Earlier this year a Work Group on Quality Improvement was initiated under the leadership of Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, and Dr. Kevin Tabb, Chief Quality Officer for SHC. This Work Group, which included a number of Clinical Department Chairs as well as hospital leaders, brought forth 16 initiatives, approximately 60% of which have now been fully implemented.

Among their accomplishments and works in progress are new communication vehicles, physician and departmental quality performance profiling, annual goals to improve quality set by departments, an Executive Oversight Committee on Patient Safety that meets bi-weekly, a task force to develop metrics on quality and clinical performance to be used in the promotion of faculty with clinical responsibilities, and the development of a Center on Quality Performance and Effectiveness. As I have also noted previously, major efforts on quality performance have been underway – and continue with renewed focus – at the Lucile Packard Children's Hospital.

While these broad institutional efforts are truly important, the greatest success will come when a culture of quality performance, based on the unique aspects and challenges of different clinical disciplines, is embedded in each department and indeed in each faculty member. I am pleased that this cultural shift is not only underway but accelerating. For example, I am aware of successful efforts in the departments of Orthopaedics, Otolaryngology, Obstetrics/Gynecology, Urology and others. I was also pleased to be invited to the Department of Surgery's Grand Rounds on October 16th for the inauguration of monthly presentations on quality and outcome presentations that are data driven and based on the efforts of surgical faculty, trainees and staff. Dr. John Morton, Associate Professor of Surgery and Director of Surgical Quality, presented a thoughtful update on a broad range of research and clinical activities aimed at improving patient quality, including the establishment of the Stanford Center for Outcomes Research and Education. I was particularly gratified to learn that programs will be directed at surgical residents, fellows and students – a key to truly creating a broad culture on quality.

While we are making progress, there is much to be done. Ultimately our success as an institution will depend on the active participation and accountability of each and every care provider. This is a goal we must not simply aspire to – we must achieve it.

LPCH to Launch Phase 2 of the Clinical Transformation Program (CTP)

On November 4, 2007, Lucile Packard Children's Hospital will launch Phase 2 of the Clinical Transformation Program. Care Provider Order Entry (CPOE) and electronic clinical documentation will be implemented on the inpatient units at LPCH using LINKS (Lucile Packard Children's Hospital Information and Knowledge System). Phase 2 marks another milestone for the development of the patient-centric electronic health record at Lucile Packard Children's Hospital. It is a vital cornerstone for improving patient safety and making LPCH a highly reliable organization. All LPCH Medical Staff members are encouraged to complete training by November 4, 2007.

Vote on Medical Staff Bylaws

Members of the Medical Staff of Stanford Hospital & Clinics will soon be receiving a ballot for the revised Medical Staff Bylaws. These bylaws have been revised to reflect changes in governance for the Medical Staff and include the **new** position of elected Chief of Staff, a position that will have a two-year term. In addition there will also be a **new** Chief of Staff elect position as well as a role for the **past** Chief of Staff. These changes are important to meet the requirements of the Joint Commission and to reflect the governance recommendations developed by the Medical Board Executive Committee and its Special Committee on Governance. ***Please do not neglect to return your ballot and support these important revisions.*** Later in the year or early next year, Medical Staff members will have the opportunity to vote for the Chief of Staff and the Chief of Staff elect. These are critical positions and will convey considerable authority. Those elected to these roles will have agreed to make considerable time and effort commitments to carry out their responsibilities. Participation by the Medical Staff in that election will serve as an important affirmation of the interest and commitment of all Members of our clinical community to this important governing body.

If you are a Member of the SHC Medical Staff please review the materials you receive and please vote on the Bylaw changes. This is most important.

Medical Testing and Motherhood: Justice Prevails

Although it seems almost unbelievable, a case has been underway in Boston involving Sophie Currier, a Harvard MD-PhD student who was denied a petition to have an additional hour break (in addition to the allotted 45 minutes) during an USMLE exam so that she could pump the milk to breastfeed her 5-month old son. Amazingly, the National Board of Medical Examiners originally refused to grant her the time for pumping, creating a vigorous debate in the medical community. The denial of such an accommodation, which has medical consequences for the mother, seemed surreal – but actually made its way to the Massachusetts Appeals Court and to the State Supreme Court, where her petition was upheld – at least so far.

Construction Projects Progressing to the Next Phase

It is increasingly apparent that the first phase of the School of Medicine master facility plan is under construction. The so-called connectivity elements project, which is relocating utilities, creating a new loading dock and preparing underground delivery

tunnels to current and future research buildings, is fully underway. At the Board of Trustees meeting on October 8th, design approval was given for the Learning and Knowledge Center (thus completing the architectural phase of this project), and site and concept approval was also granted for the Stanford Institutes of Medicine 1 building. As you will recall, the LKC will be housed on the current site of the Fairchild Auditorium, and SIM1 will be on the parking lot south of CCSR. To move to the next phase, further limitations on parking are occurring (sorry!), and, in the next couple of weeks, the Fairchild Auditorium will be fenced in, new temporary sidewalks will be constructed, and the process for the demolition of the Fairchild Auditorium will commence. Because the materials will be recycled, the demolition will be more of a dismantling process. During the winter break the Beckman bridge will be taken down, and by April of 2008 construction of the new LKC will commence – at last. It is scheduled for completion in late 2010.

In tandem, work on the design of SIM1 is moving forward rapidly with a goal of completing construction of this first of a series of new research buildings by mid 2010. As this project gets underway, we are already focusing on the FIMs (Foundations in Medicine buildings) that will ultimately replace the School of Medicine Grant, Alway, Lane and Edwards buildings.

In addition to our development and transformation of the Medical School campus we are also working with the University on the North Campus at Redwood City, which will ultimately house a significant number of administrative staff and others in what will be an exciting new environment. As part of this series of location and relocation projects, we have also taken a 15 year lease at 1070 Arastradero Road– an office building next to 1050 Arastradero Road, which currently houses parts of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and the Neuroscience Institute. This facility will house faculty engaged in “dry lab” research and will provide a nucleus from which to develop excellent and exciting programs.

Obviously, a lot is going on and I will be reporting regularly on new updates and changes as they emerge and develop.

Biodesign at Stanford

Although I missed the update on the Biodesign program that was given by Drs. Paul Yock, The Martha Meier Weiland Professor in the School of Medicine and Professor of Bioengineering, and Tom Krummel, Emile Holman Professor and Chair of the Department of Surgery, to the Executive Committee on October 19th due to my travels to Shanghai (see below), I am pleased to present this update from them for your information.

“The Biodesign program is entering its seventh year with the mission of “training the next generation of leaders in biomedical technology innovation”. The core of the program is the Biodesign Innovation Fellowship, a postgraduate training program that combines engineers and physicians in a year-long process of needs finding, invention and

implementation. There are two teams of fellows this year, focusing on innovations in critical care and anesthesia. Ron Pearl (Chair of Anesthesia) and colleagues have assumed a key role in organizing the teams' clinical immersion experience. The clinical areas and partner departments for next year are under discussion. Over the past six years Biodesign fellow and student teams have invented a number of new platform technologies, leading to the formation of seven venture-backed companies, four of which have FDA-approved devices. A total of 3,500 patients have been treated so far by these inventions from Biodesign trainees.

A new branch of the program, Stanford-India Biodesign (SIB), will launch in January '09 in collaboration with the All-India Institute of Medical Sciences (AIIMS) and the India Institute of Technology (IIT) in Delhi. A new SIB center is under construction in Delhi and the first group of five fellows has been selected. SIB Fellows will spend a total of two years at Stanford and in Delhi and will focus on inventing new technologies for the medically underserved in India.

Biodesign is also working with the leaders of the new Stanford Center for Clinical and Translational Education and Research (SCCTER) to develop an "accelerator" program to assist faculty and students in technology transfer of new medical devices inventions."

Soliciting Views and Comments on the Length of the Stanford Medical Student Program

In the October 8th issue of the Dean's Newsletter I presented the pros and cons regarding the length of the medical education curriculum. In my discussion I focused attention on what I referred to as the Flexible Five Plan. An important reason for my commentary was to generate and solicit discussion among our students, faculty and staff regarding the wisdom of promoting Stanford School of Medicine as a flexible five-year program, recognizing that more than 70% of our current students spend five or more years at Stanford. From my perspective the major advantage in formalizing a Flexible Five Year Plan is that it makes clear that we believe that more than a traditional four year experience is needed to benefit fully from the Stanford experience and ideally to acquire the additional skills and knowledge to promote a career path toward scholarship, research and leadership.

The concern about characterizing our curriculum in terms of five years is that it may inadvertently discourage highly qualified students from considering or applying to Stanford or in joining the medical school even if accepted, simply because their goals have been less defined or the uncertainties of an extra year prompt them to chose a more traditional four year program. In particular, there is the concern that this might selectively bias underrepresented minority students or women from considering Stanford – something that we can all agree would be a serious breach of our institutional goals and commitments. Even so, I do believe that Stanford is unique among medical schools and that we should celebrate this reality. We should also seek communication strategies that emphasize that the Stanford Medical School experience is transformative but also flexible in providing a panoply of learning and career paths. Clearly this must also be coupled with clear guidance on our website and in oral and written communications to potential applicants as well as in our mentoring and career guidance programs for our students.

This clarity must also include more transparency about the financial burdens of medical education and more specifically how the Flexible Five Plan will not incur extra costs to students – and perhaps just the opposite. At the same time, we need to make clear that we will be supportive to students who wish to complete their medical education in four years and will strive to make that experience as meaningful and productive as possible.

Since my October 8th communication I have received a number of emails from students and faculty regarding the perspective I offered in the last Dean's Newsletter. With only a single exception, the comments received were supportive of the Flexible Five Plan, highlighting the merits of being clear about our goals but also flexible for individual students. Because students are now actively applying for the 2008 incoming class it is important to provide as much guidance to them as we can – but also to let them know that Stanford is a community that welcomes open dialogue, is willing to share individual viewpoints and has, as its most important objective, the goal of providing the very best learning experience to each and every student and trainee who joins our community.

Shanghai and Stanford

On October 18-19th I had the opportunity to help celebrate the anniversary of the Shanghai Jiao Tong University School of Medicine by delivering a keynote address on the history of American medical education. During the visit I also had the pleasure of meeting a number of distinguished medical and university leaders (some with Stanford connections) and also to visit two of the Medical School's 12 major affiliated teaching hospitals – the Rujin Hospital and the Shanghai Children's Medical Center. While there are striking differences between China and the USA, I was quite struck and interested in the commonality of interests between what we are attempting to achieve at Stanford and the goals of the faculty at Shanghai Jiao Tong University. Specifically, we share an interest in and commitment to excellence in both science and medicine and to the training of physician leaders who have an orientation to academic medicine and research.

While there are differences in the scope of our resources, I was impressed by the quality of the research facilities and the work being conducted. But I was particularly impressed by the differences in the size and scope of the programs – especially the hospital facilities and the faculty who staff them. For example, there are 12,000 inpatient beds among the 12 affiliated hospitals, and each year some 13 million outpatients are served and over 140,000 operations performed. Of course, the size of these programs relates to the population of Shanghai, which numbers over 18 million – and which continues to grow dramatically in people, infrastructure and facilities. Among Shanghai Jiao Tong's major affiliated hospitals, the Rujin Hospital, which just celebrated its 100th anniversary, is very much a teaching and academic facility with new research and education facilities. The Shanghai Children's Medical Center, which has over 400 beds, is among the finest pediatric facilities in Asia and has numerous programmatic collaborations and interactions with children's hospitals throughout the world – particularly in the USA. While I hope I was successful I sharing some insights about our approach to medical education, research and patient care, I also learned a tremendous amount about the aspirations and achievements underway in Shanghai – affirming once again how global

our community is becoming and why Stanford's mission to reach out to our international colleagues is so timely, relevant and important.

Legislators Begin Setting the Bar on Gifts

During the past couple of years, I have written frequently about the interactions of the pharmaceutical and device industries with academic medical centers in general and with physicians and biomedical scientists specifically. On the one hand, institutions like Stanford are eager to forge close partnerships with industry to develop research programs to bring treatments, diagnostic products or useful concepts to the public and are committed to bringing these collaborations to fruition. This is in many ways an integral component of our overarching mission in *Translating Discoveries*.

On the other hand, the excessive use of marketing by industry through “free lunches” gifts and other inducements – generally aimed at getting physicians or scientists to promote more favorable prescribing patterns or device utilization – has been increasingly scrutinized. In 2006 Stanford, along with Penn and Yale, provided leadership by banning a number of these marketing strategies. Our [Stanford Industry Interactions Policy web site](#) is clearly explicated about this. It prohibits our faculty, students and staff from engaging in such marketing tactics and provides other, related guidelines. These have been emulated by academic centers and teaching hospitals across the nation and are becoming more of the standard. That said, state legislators in Minnesota have set a high bar that has opened the door for additional state or even federal legislation – a process that is already underway. Specifically, in Minnesota pharmaceutical industry sales representatives are prohibited from giving doctors more than \$50 per year worth of food or gifts – dramatically curtailing the marketing activities that were previously used by industry. In addition, Minnesota now requires industry to report all consulting payments made to physicians through a publicly accessible registry. Similar actions have occurred in Maine, Vermont and West Virginia and, as I mentioned in the [August 20th Dean's Newsletter](#), efforts are underway to make this a federal legislation.

Of course, industry has responded by shifting the groups they solicit – moving from doctors to nurses and, of course, to patients, through direct advertising. And while we can all understand and appreciate the need for industry to market its products, it is essential that as professionals we are not complicit in that process. Rather, our recommendations must remain objective, data driven and free of entanglements that confuse behavior or policies. Needless to say, this issue is very much part of the public domain, and one can envision numerous other regulations being imposed – in part because as a profession we have often failed to take on these responsibilities ourselves. I hope that can change as well.

Faculty Elected to the Institute of Medicine

On October 8th the Institute of Medicine of the National Academy of Sciences announced its newly elected members for 2007. Of the 65 newly elected members, four currently hold Stanford academic appointments and one is slated to become a member of the

Stanford community next year. The newly elected members bring the current number of IOM Members at Stanford to 56. They are:

- **Dr. Ronald Levy**, Robert K and Helen K Summy Professor of Medicine
- **Dr. Michael Longaker**, Deane P and Louis Mitchell Professor of Surgery
- **Dr. Matthew Scott**, Professor of Developmental Biology and Genetics and Bioengineering
- **Paul C. Tang**, Consulting Associate Professor and Vice President and Chief Information Officer, Palo Alto Medical Foundation

In addition, Dr. Tom Sudhof, currently Chair of Neurosciences at the University of Texas Southwestern Medical Center, is anticipated to join the Stanford Community in 2008.

Congratulations to each of these distinguished faculty members.

Awards and Honors

- The Stanford Center for Clinical and Translational Research and Education (SCCTER) has announced the first awardees in its new program of support for pilot studies directed at two needs: improving methods for clinical trials and novel translational clinical trials. Funding of up to \$50,000 per year for each of two years was available. Priority was given to junior faculty and those applications involving multiple departments or faculty. Funding for this program is provided by the T. Robert and Katherine States Burke Fund and the Stanford Center for Clinical and Translational Education and Research (SCCTER). The successful applicants and the titles of their projects are:

Christopher Gardner, PhD, Assistant Professor of Medicine
"Improving Minority Recruitment for Randomized Clinical Trials Conducted at Stanford"

Richard Moss, MD, Professor of Pediatrics
"Addressing a Critical Bottleneck in Cystic Fibrosis Trials: An Integrative Tool for Small for Metabolite-Based Outcomes"

Richard Olshen, PhD, Professor of Health Research & Policy, and by courtesy, Electrical Engineering and Statistics
"The Design of Phase I and II Randomized, Double-blind, Vaccine Clinical Trials"

Irene Wapnir, MD, Associate Professor of Surgery
"A Pilot Study to Determine Radioiodide Accumulation and Dosimetry in Breast Cancers Using 124 I-PET/CT Imaging"

- **Dr. Greg Albers**, Professor of Neurology, was installed as the first incumbent of the Coyote Foundation Professorship, which was made possible by a generous gift from Vincent and Susan Borelli. We had the opportunity to thank and

acknowledge the Borellis along with some of their friends and colleagues at a wonderful event in the Cantor Art Museum on Wednesday evening, October 10th. This was also an opportunity to celebrate the work of Dr. Albers who, along with Dr. Gary Steinberg, Professor and Chair of Neurosurgery, developed one of the first and most successful Stroke Treatment Centers in the nation. I also want to thank Anne Longo, in the Office of Medical Development, and Frank Longo, Professor and Chair of Neurology, for their instrumental role in bringing this professorship to fruition. Please join me in congratulating Dr. Albers as the first incumbent of the Coyote Foundation Professorship.

- **Dr. Stan Falkow**, Robert W. & Vivian K. Cahill Professor in Cancer Research, received the Infectious Disease Society of America 2007 Mentor Award for his remarkable and sustained role as a faculty mentor – in addition to being an extraordinary scientist.
- **Trig Garg** and **Bonnie Wong**, two students from this past summer's CCIS/ITI Summer Program been named as National Semifinalists in this year's Siemens Competition, and are still in the running to make it to the National Finals.

Congratulations to both on this fantastic accomplishment.

Appointments and Promotions

- **Fritz Bech** has been appointed to Assistant Professor of Surgery (Vascular Surgery) at the Palo Alto Veterans Affairs Health Care System, effective 10/1/07.
- **Larry F. Chu** has been reappointed to Assistant Professor of Anesthesia, effective 10/1/07.
- **Margrit M. Juretzka** has been appointed to Assistant Professor of Obstetrics and Gynecology, effective 10/1/07.
- **Aya Kamaya** has been appointed to Assistant Professor of Radiology, effective 10/1/07.
- **Calvin Kuo** has been promoted to Associate Professor of Medicine (Hematology) effective 10/1/07.
- **Maarten Lansberg** has been appointed to Assistant Professor of Neurology and Neurological Sciences, effective 10/1/07.
- **John M. Morton** has been promoted to Associate Professor of Surgery (General Surgery), effective 10/1/07.
- **Jonathan Pollack** has been promoted to Associate Professor of Pathology, effective 11/1/07.
- **Justus E. Roos** has been appointed to Assistant Professor of Radiology effective 10/1/07.
- **George P. Yang** has been reappointed to Assistant Professor of Surgery (General Surgery) at the Palo Alto Veterans Affairs Health Care System, effective 10/1/07.

- **Yanmin Yang** has been promoted to Associate Professor of Neurology and Neurological Sciences effective 11/1/07.

Dean's Newsletter

November 5, 2007

NIH Funding and Peer Review

One of the most significant challenges affecting academic medical centers is the continued decrease in research funding through the National Institutes of Health (NIH). Following the completion of the NIH doubling in 2003, the annual budget for the NIH has been below inflation, placing an enormous strain on new and established investigators and institutions. Just this week the Oregon University for the Health Sciences reported the serious financial challenges it is facing, in part related to the growth of its research enterprise in recent years. Research is obviously an important mission that has many important dividends, but it requires significant institutional support since research *per se* is not a revenue generating operation.

We know this to be true at Stanford, where, despite the enormous success of our faculty in receiving peer-reviewed NIH funding (in fact the highest amount per faculty member of any medical school in the nation), every dollar brought in through research requires nearly 30 cents of institutional support. One can say that, viewed simplistically, the larger and more extensive the research enterprise, the more institutional support required. Even so, in anticipation of and certainly during the NIH doubling, many academic medical centers throughout the USA significantly expanded their research facilities and faculty with the expectation that the research support from NIH would be sustained at least on par with biomedical inflation. Unfortunately that has not happened – and in fact the NIH budget has been below inflation for four years and gives evidence of continuing this unfortunate trend for the immediate future.

I have shared my thoughts about this challenge – as well as our actions to increase NIH funding – in prior issues of the Dean's Newsletter. While I do believe that the current negative trend will eventually reverse, I fear that it is likely to continue for the next year(s), especially given the current strains on the federal budget with the continuing war in Iraq, etc. There is no doubt that our faculty are feeling the strain as well and are writing more grants or revising others just to keep up. And many of our junior faculty note the decreased availability of their more senior mentors to review and advise them about their grants, due to the burden of time more senior faculty are spending on securing their own grant support.

Thankfully we were not part of the building boom that is now impacting other centers. This was purposeful, although we are woefully short on both wet and dry research space at this time. Hopefully this will be addressed by our staged Master Plan development that will unfold during the next 10-15 years. Ultimately this plan will provide the necessary high quality research space that our faculty need and deserve – but it will take time to get

there. On the other hand, the fact that our building plans are staged temporally also means that we can adjust our future growth and recruitments to the funding environment that exists at the time – allowing us to be more proactive and not simply reactive, which is the situation in which many institutions now find themselves.

Status of NIH Funding for FY 2008

On Thursday, November 1st the House-Senate conferees on the FY08 Labor-HHS-Education Appropriations Bill approved a conference agreement. As it currently stands this includes a \$30 billion budget for NIH. This is an increase of \$1.1 billion – or 3.8% over FY07. But this includes a \$300 million transfer to the Global HIV/AIDS initiative, so the actual NIH budget is \$29.7 billion or a 3.1 percent increase. As it currently stands, the conference report will be filed today, Monday, November 5th and then sent to the House floor – perhaps on Wednesday, November 7th. Senate action is expected shortly after the House vote.

Not surprisingly, but unfortunately, incremental funding for stem cell research was removed from the bill in the Senate – except for work on cell lines generated prior to August 2001. Thankfully, with the California Institute for Regenerative Medicine (CIRM) now moving forward, we will be able to carry out stem cell research in California and at Stanford – but our national investment in this important area of investigation will continue to lose out to other nations around the world where stem research is proceeding forward.

There is still a lot of volatility in the budget process, so that the actual FY08 allocation for NIH may go up (unlikely) or down. And while the approximately 3.5% increment over FY07 is better than the President's budget – and better than what we recently expected - it is still lower than what we and our peer academic medical centers and professional advocacy groups around the country had advocated and hoped for. So, this difficult funding climate for NIH will certainly continue for another year. Of course, we will continue our work in Washington, both as an institution and in conjunction with other national and local organizations and agencies, to make the case that increased funding of NIH is a critical national investment in innovation.

NIH Peer Review

In part related to limitations in NIH funding, many investigators have questioned whether modifications in the peer review system – including grant application size and scope, scientific review by study sections, etc – should undergo revision. In response to these concerns, the NIH recently hosted a series of Regional Consultation Meetings on Peer Review. I attended one of these sessions, which was held in San Francisco on October 25th. It was moderated by Dr. Lawrence Tabak from the NIH along with Dr. Keith Yamamoto, Executive Vice Dean at UCSF; Dr. Bruce Alberts, Professor of Biochemistry and Biophysics at UCSF and prior President of the National Academy of Sciences; and Dr. Mary Beckerle, Senior Director of Laboratory Research at the University of Utah.

NIH is seeking broad input on the peer review process from investigators, professional societies and other interested parties. Reviews are taking place within the NIH as well as

in the extramural community. Issues such as shortening the cycle of grant reviews, the assignment of applications once a grant proposal arrives at NIH, the composition and alignment of study sections, and electronic submissions are among the topics being studied. The goal is to fund the best science by the best scientists with the least administrative burden. With that in mind, the stated purpose of this ongoing process is to identify possible pilot projects that might be implemented in the winter or spring of FY08. The NIH is interested in comments from the broad community, and you can send yours to PeerReviewRFI@mail.nih.gov. You can also gather additional information at the NIH homepage or at <http://enhancing-peer-review.nih.gov/>.

Dr. Yamamoto, in his presentation, identified a number of issues with the current peer review system. Among these are the intrinsic conflicts that exist due to the fact that as reviewers we tend to reward “like mindedness.” We also know that top scientists tend to defend the prevailing paradigm (especially their own), which can make it sometimes difficult for new or transformative ideas to emerge. Moreover, reviewers and applicants are often both competing for the same pool of funding (which is shrinking), thus creating another kind of potential conflicts or bias.

In addition to these inherent conflicts, it needs to be acknowledged that the nature of research has changed – proposals are often broader in scope and greater in complexity, requiring a wider spectrum of expertise. Also, research projects are now, to an increasing degree, being performed by teams rather than by individual scientists in the traditional principle investigator model that has existed during the past decades. Added to this is a panoply of reactions and changes consequent to the flattening of the NIH budget. For example, there has been an explosion of grant applications (over 80,000 last year) as investigators seek ways to restore or sustain the funding of their research programs. This is made worse by the 13% decline in the budget’s spending power. The numbers of applications and their greater complexity have required an expansion of NIH reviewers (now 18,000), but there are fewer senior faculty reviewers among them compared to a decade ago. Sadly, the current pressures have also led a number of study sections and reviewers to adopt a more adversarial tone.

These changes clearly further heighten the problems created by decreases in NIH funding and require some new and bold thinking about how to move forward. Among the questions that need to be considered are whether the review process should be more *people* than *project* focused, whether it should follow more of an editorial board model, whether the face-to-face study sections should continue to be held, and whether the scoring system should be changed to a scoring system.

According to Dr. Tabak, a number of recommendations have been forthcoming from the regional consultation meetings – many of which also arose at the San Francisco meeting I attended. These include potential changes in review criteria (e.g., project vs. person, blinding reviewers to the applicant’s names and institution, minimizing the requirement for preliminary data) as well as in review mechanisms (e.g., use of a two-staged review process, development of an applicant-reviewer dialogue during the review process to address and resolve reviewer questions). In addition, questions have arisen about

modifying the review process according to the type of science (basic, clinical, clinical trials, interdisciplinary) or the applicant (new vs. established). And of course there has been discussion about the actual grant proposal– whether to decrease the required page count, modify the budget process, require preliminary data – and also whether to apportion the research investments according to perceived value or importance. An additional area of comment has been the current scoring system and whether that should be changed to a ranking model or a matrix scoring system.

It seems inevitable that some changes will be made in the peer review system at NIH – although hopefully any changes will be done carefully and incrementally so as to not inadvertently worsen an already compromised situation. Again, if you have thoughts or recommendations about how to improve the peer review process, send them to PeerReviewRFI@mail.nih.gov or alternatively send them to me, and I will get them to the appropriate individuals.

Clinical Research in Children

SPCTRM (Stanford-Packard Center for Translational Research in Medicine) joined with the CHRP (Children's Health Research Program) and the Department of Health Research & Policy to lead a week long intensive course in clinical research, study design and performance from October 22-26th. This is the second year of this offering and I want to thank Drs. Steve Alexander, Phil Lavori and Christy Sandborg along with their faculty and staff for making this program so successful. The clinical fellows and junior faculty who attended the course spent considerable time in didactic and practicum sessions that sharpened their skills in study design, data gathering and management, analysis, and reporting, as well as the ethics of pediatric research. While this program had a pediatric focus, I hope that future efforts address faculty and fellows from other medical and surgical disciplines.

I had the opportunity to address the attendees and to reflect on the history and current status of clinical research in children. In doing so I reviewed the recent and past accomplishments – as well as some of the problems and challenges that have had an impact on pediatric research. For example, we all recognize the enormous benefits that have resulted from pediatric immunizations, the development of surfactant for RDS (respiratory distress syndrome), advances in childhood cancer, pediatric AIDS, and surgical and technical innovations. But we also need to remember well-intentioned research with negative, even if unintended outcomes (e.g., thymic irradiation and consequent thyroid cancer, studies on the transmission of infectious agents like hepatitis B, early forays into gene therapy leading to leukemia) that have impacted public as well as medical perception of pediatric research.

Another challenge is that therapeutic research in children is frequently limited or truncated by industry concerns over potential adverse reactions that might affect overall drug sales – or by the fact that children are such a small component of the marketing portfolio, so that drug companies are simply not motivated to invest in pediatric research. This has resulted in the fact that nearly 80% of drugs approved for adults have never been tested in children and that their dose and schedule has not been appropriately determined. While pediatricians use these drugs “off-label” and pharmacies formulate them for

children, the assumed dosages may turn out to be different in children, resulting in significant negative consequences – as was observed when cyclosporine was first introduced, when antidepressants were given to teenagers, or most recently, when even commonly used agents, like cold remedies, were found to be unsafe in children, leading to pronouncements from advisory bodies (e.g., the FDA) with consequent confusion and concern by parents and families (see: NYT Editorial “Children and Cold Medicines”).

To help address the lack of development of drugs for children, a significant advocacy effort (which I contributed to) resulted in the *Best Pharmaceuticals for Children Act of 2002*, which mandated that drug companies develop a plan to test new agents in children as part of their overall clinical trial portfolio. I should add that our Congresswoman, Anna Eshoo, played a critical role in moving this bill to approval, for which we are all grateful.

While there has been more focus recently on pediatric clinical research, there have also been some new challenges. A consequence of the Best Pharmaceuticals for Children Act was a charge to the Institutes of Medicine to review and make recommendations about the broad dimensions of pediatric clinical trials, which it did in a publication entitled *Ethical Conduct of Clinical Research Involving Children* (2004). The 14-member panel that was chaired by Dr. Richard Berhman (formerly Director of the Children’s Health Initiative for LPMC and Stanford) addressed three broad themes:

1. *“Well-designed and well executed clinical research involving children is essential to improve the health of future children – and future adults – in the United States and worldwide. Children should not be routinely excluded from clinical studies. No subgroups of children should be either unduly burdened as research participants or unduly excluded from involvement.*
2. *A robust system for protecting research participation in general is a necessary foundation for protecting child research participants in particular. An efficiently administered, effectively performing system with adequate resources must, however, commit additional resources and attention to meet ethical and legal standards for protecting infants, children, and adolescents who participate in research.*
3. *Effective implementation of policies to protect child participants in research requires appropriate expertise in child health at all stages in design, review, and conduct of such research. This expertise includes knowledge of infant, child and adolescent physiology and development as well as awareness of the unique scientific, psychosocial, and ethical requirements and challenges of pediatric clinical care and research.”*

An important aspect of therapeutic clinical research involving children is the definition and balance of “minimal risk.” The definition of minimal risk determines whether an Institutional Review Board (IRB) will consider and approve a pediatric clinical trial. This determination is also influenced by whether the minimal risk is offset by or justified by anticipated benefit to the child. This does not mean that research that does not convey

benefit cannot be done – but it does set the bar higher and on occasion takes the decision outside of the institution – even up to the Secretary of Health and Human Services.

While I agree with most of the arguments and points made in the IOM document I do have one major objection to their interpretation of “minimal risk.” More specifically, the document is explicit in defining this as “the probability and magnitude of harm or discomfort anticipated in the research are not greater in and of themselves than those ordinarily encountered in daily life or during the performance of routine physical or psychological examinations.” While this may be appropriate for research involving normal children (e.g., for a new immunization) it is, I believe, a serious problem for developing new therapies for children with serious or life-threatening disease.

Having spent decades in conducting research involving children and adults with cancer and various infectious diseases, including HIV/AIDS, I would argue that these populations are already at risk for outcomes that are quite different than normal populations, and the determination of “minimal risk” should be informed by the context of the disease and potential outcome affecting these specific populations of children with disease. That is, minimal risk should not be defined in relation to the “normal experiences of average, healthy, normal children...in their daily lives” but rather to children facing a life threatening illness whereby minimal risk is defined in relation to their life situation. While I certainly recognize the principle of protecting children from harm, I also am a strong advocate for advancing knowledge to improve the lives of children facing serious and life-threatening illness. Had the interpretation of the IOM committee been strictly enforced over the past two decades or so, I fear that many of the advances in treating children with cancer, AIDS or other disorders may not have occurred – which is clearly unacceptable.

I also focused on the pathways for career development and the skills and achievements necessary to facilitate academic advancement as well as to promote the highest quality pediatric research possible. While Stanford has had only a relatively modest effort in clinical research heretofore, this is changing, and it is incumbent on all of us to assure that over time, the excellence of our clinical and translational research efforts and investment approximate that of our outstanding accomplishments in basic science research.

First Summit on Clinical Excellence

On Saturday, October 27th more than 70 leaders from the Stanford University Medical Center gathered at Arrillaga Alumni Center for the first Summit devoted to improving the quality of patient care. The Summit resulted from the efforts of the SHC Medical Staff, led by its President, Dr. Bryan Bohman, to give voice to the importance of assuring and improving the quality of patient care across the medical center. I should add that there are ongoing and important activities in quality and outcomes research at Lucile Packard

Children's Hospital, but the focus of this Summit was the adult hospital. Future meeting will surely be more inclusive of the full spectrum of clinical challenges.

The importance of clinical excellence was underscored by the attendance and participation of the chair of the Board of Directors, Mariann Byerwalter, who is also the chair of the Medical Center Committee of the University Board of Trustees. In addition, Dr. Woody Myers, former University Trustee and current SHC Board member and chair of the Quality Committee, also attended and actively participated – giving evidence of how serious the hospital and University Board members believe our efforts are in this area. As you know from prior communications, the current focus on quality of patient care services at both the institutional and the individual physician provider levels has become a focus of national concern and discussion. Hospitals – as well as individual doctors – are being compared by various outcome metrics, and, increasingly, the results are being published to make them available to patients and consumers as well as to the payers of health care.

Without question, perceived and actual performance will guide payments to hospitals and providers – as well as the referral of patients to medical care systems. As such, we are in competition with regional and national peers, including community hospitals as well as large medical centers. While the Stanford name carries brand value, that will surely be affected by how we fare on future evaluations and ratings. Moreover, our work in the area is not a point in time effort but one that will require constant improvement and oversight. It is something we all must take seriously, since in the end we will only be as good (or excellent) as is each member of the medical and related professional staff. And while we are focusing on quality at this juncture, equal attention has to be paid to the “service” we provide – which many would argue is also in need of continuing improvement.

To guide the discussion at the Summit for Clinical Excellence, the attendees heard from Dr. Paul Gluck, Associate Clinical Professor Obstetrics & Gynecology at the University of Miami School of Medicine and Chair of the Board of the National Patient Safety Foundation, and from Dr. Gerald Hickson, Associate Dean for Clinical Affairs and Director of the Center for Patient and Professional Activity at Vanderbilt University Medical Center. Dr. Gluck reminded the group that there are 44,000-90,000 deaths per year in the United States due to medical errors – which if put in the context of a disease, would make it the #3 cause of death. The cost of these errors ranges from \$17-29 billion. There are many reasons for these numbers, including the fact that as treatments have gotten better the risk for an adverse outcome has increased. In addition to problems with human fallibility, the very complexity of modern medicine-with emerging technologies, a broad array of powerful drugs, various professional backgrounds and, not infrequently, unclear lines of authority-contribute to making our medical system error prone.

One of the more insightful questions asked by Dr. Gluck was whether simply more rules could or would make our health care system safer. He argued that a focus just on rules has not had a major impact and that a culture of safety (and quality), as well as a focus on principles to assure patient safety, would have a greater impact than simply developing

more rules. He underscored that such a shift would require leadership – beginning with Board members and institutional leaders and extending to all who are engaged in the health care system. Patient safety must be viewed as everyone’s responsibility. Of course there must be clear delineations of responsibility and accountability. But safety can also be improved by designing systems to promote safe choices, by standardizing processes, supplies etc., and by putting less reliance on individual memory (e.g., of drug doses) and more on system prompts (e.g., information technology). This also requires team function and helpful interactions that are mutually responsible and accountable. Further, the systems put in place should anticipate the unanticipated and foster a culture that is non-punitive, transparent and focused on safety. An on-line resource that Dr. Gluck recommended is from the [National Patient Safety Organization](#).

The Summit also included updates on the current status and progress at SHC (which I have commented on in a [recent Newsletter](#)) and the experiential efforts made at Vanderbilt that were described by Dr. Hickson. The attendees then heard brief presentations about the quality improvement plans of three clinical departments (Orthopedics, General Surgery and Medicine) as examples of current efforts, along with some observations and critiques of these and related efforts that are underway at the Medical Center, a number of which were further refined in small group discussions.

Overall, I felt that the first Summit on Clinical Excellence was a success in highlighting the importance of the problems and challenges we face and in bringing together the communities of faculty and community physicians with hospital staff and leaders. There were some important lessons learned and experiences delineated – but it is also clear that we are at the beginning of what will be a continuing journey and that we still have a lot to learn and much to do. But the good news is that there is an ever-widening commitment to make quality a true medical center priority. In reality we have no choice – but we can only succeed with the work and commitment of each member of our community.

Personal Perspective on Clinical Quality

Recently Stanford Hospital & Clinics has launched a number of communication vehicles to highlight and underscore its commitment to improving patient care quality and safety. I was asked to write a brief opinion piece for one of these publications, which is entitled Compass. I am taking the liberty of including my comments in this Newsletter as well, as they relate to my views about this topic and the efforts currently underway to address it.

Undoubtedly, each of us has had a recent medical encounter -- with a family member, friend or ourselves. Many of us have also delivered care to a patient in the hospital or some other setting. We take for granted when we receive or deliver care that it is of the highest quality, the most cutting-edge, the most sophisticated available. But is this really true?

I certainly do not question that it is the intent of physicians and health care providers to deliver the very best care possible. But intentions are not good enough. The reality is that when a bright light is shined on our personal practices, inadequacies and imperfections are likely to be seen. To be sure, delivering medical care in high-volume, high-acuity

centers like Stanford is challenging. And while there are opportunities for technical and cognitive *tours de force*, there are also abundant chances for errors and mistakes. This is especially true when we think we are better than we are -- beyond error, reproach or the metrics used to measure and report the "outcomes of the merely average". After all, if we are members of the Stanford community, we must be on the top of the quality pyramid. I would argue that once we assume that, we become especially vulnerable to errors and mistakes.

I have practiced medicine in one form or another for well over three decades and during that time have cared for both adults and children with complex disorders like cancer or severe infectious complications. And like many of my Stanford colleagues, I would like to think that I am among the best in the field in my knowledge and clinical acumen. But if subject to critical and rigorous scrutiny, I fear that some of my medical decisions and knowledge would be called into question. Indeed I am always humbled by that prospect. Ironically, I suspect that the most sophisticated of my medical decision-making would be less vulnerable to critique than the decisions or recommendations one takes for granted, or simply fails to question. In fact, if compared to others on some "standardized evaluation scale" I suspect I would come up short on certain metrics and would likely want to offer a variety of reasons to justify my case or explain why the metrics were incorrect and shouldn't be applied to me -- especially given the complexity of the patients I am involved with. And that would be a big part of the problem.

Physicians are notoriously individualistic in their styles, experience and self-assurance. Some of this is essential to successful medical practice, especially in technically demanding fields. But it can also color one's ability to accept criticism or to acknowledge that common standards may be equally or sometimes even more important than one's own unique knowledge. Multiplied over and over again throughout an institution like Stanford, one can appreciate how a culture of individuality, self-assurance and presumed excellence -- and where attention to "minimal or expected" standards might be ignored, excused or even dismissed - can actually result in poorer than expected performance when compared to peer institutions that pay attention to such metrics.

None of us want to be judged or compared to others unless we can be viewed as the best - or at least to have our way of doing things acknowledged as the preferred or ideal method or approach. Unfortunately, in the new world order of national quality norms and metrics, that is not likely feasible or even acceptable. We each need to strike a balance between individual excellence and adherence to accepted standards -- even when we believe our own way is better. Whether we like it or not, we will be judged on that basis. And while for now those judgments are institutional and not personal, in time they will become increasingly physician and provider specific.

Of course the most important reason to focus on the quality of our performance -- which requires a continuous improvement process -- is because that is how we best serve our patients -- including our friends and families. But unless we are seen in the community as

providing the highest quality care when measured by national metrics -- not just our own personal or medical center self-evaluation -- we run the risk of losing respect and value. In the rapidly emerging era of "pay for performance" that also means we can lose revenue and even referrals. This will necessitate a culture change for each of us individually and for our institution as a whole. We need to be willing to suspend some of personalized standard of care and engage in team-based efforts that "standardize" rather than individualize aspects of our clinical practice. While I know this will be a challenge for some, it is also essential for the sake of our medical center community. While in the future we might be called up to write the book that defines quality performance, right now we have to demonstrate that we can read the book that all institutions are being mandated to follow. Only with that foundation in place will our "individual Stanford excellence" be really accepted and valued.

Thanks to Nancy Tierney

It is impossible to think about facilities planning, laboratory or office renovation in the School of Medicine without also thinking of Nancy Tierney. Nancy has been the mainstay of facilities planning for the School of Medicine for close to 12 years and is recognized as a knowledgeable and respected leader at Stanford and nationwide. Thus it is not surprising that she has been lured to a new and exciting challenge as the Associate Dean for Facilities and Planning with the University of Arizona College of Medicine, Phoenix, where she will help plan and develop a new medical campus. While I can certainly appreciate Nancy's motivation to take on this exciting new challenge, it is to our loss at Stanford, where she will be surely missed. I want to thank Nancy Tierney for all that she has done to improve the institution we work at – our education, research, office and even clinical spaces. She has served us remarkably well, and I know I speak for our entire medical community and in saying we are deeply appreciative.

Please join me in thanking Nancy Tierney for many wonderful contributions and in congratulating her and wishing her future success in her new position at the University of Arizona.

The Stanford Wellness Collaborative

Over the past year a University wide effort, initiated by Provost John Etchemendy and led by Mr. Eric Stein, Senior Assistant Athletic Director, Physical Education, Recreation and Wellness, has engaged faculty, students and staff to develop programs and initiatives to promote health and wellness. This is an enormously important program and one where Stanford University can almost certainly serve as a national role model. Numerous health promotion, exercise, diet and other programs are taking place at Stanford, and you can learn more about how they might affect you and your coworkers by visiting the new website <http://BeWell.Stanford.edu/> . I encourage you to visit this site and begin incorporate some of its offerings into your own life.

Student Affairs Takes on a New Name

As of November 1, 2007, the Office of Student Affairs (OSA) will be known as ***Educational Programs and Services (EPS)***. This name change was prompted by a desire to capture the breadth and depth of activities carried out by this important component of the Dean's Office. More specifically, the old name, "Office of Student Affairs," suggested that its responsibilities were limited to providing services (i.e., admissions, advising, registrar, financial aid, and student life) for students (i.e., medical students and graduate students). While providing student services is a critical part of the responsibilities of this office, the new name more accurately reflects the comprehensive education, training, and service responsibilities of the organization. The new name also reflects the fact that EPS leads programs and services for more groups than medical and graduate students, including postdoctoral scholars, residents and fellows, and Continuing Medical Education learners. A complete list of programs and services can be found on the [Educational Programs and Services web page](#).

Preparing for Pandemic Flu

At the November 2nd Executive Committee meeting, presentations were given regarding the emergency planning to date by the University, for the Stanford campus, and by the hospitals, for providing medical care, in the event of a pandemic influenza.

Lawrence Gibbs, Associate Vice Provost for Environmental Health and Safety, described interventional and mitigation strategies that would be used by the University in such an event. These fall into two categories: pharmaceutical (such as vaccination, if available, and treatment of infected individuals) and the implementation of social distancing and other infection control measures. These latter measures could include the suspension of classes; sending students home; dispersal of faculty/staff not required during emergency; minimization of assembly of people; information and education on infection risks and controls; and mitigations for personnel involved in emergency response. Mr. Gibbs emphasized that the goal of the plan is to respond in a timely fashion to mitigate the effects of a pandemic flu on the Stanford community. A key decision would be at what point in the onset of a pandemic to initiate the dispersal of students.

Mr. Gibbs also outlined the key elements of the campus plan and reviewed the response areas and levels of action that might be required. The response areas are: communications; academic and research programs; student affairs and housing/dining operations; administrative services (faculty and staff); and facilities, transportation and campus security. He described the critical issues for the response levels, which range from "0" (limited/isolated international cases) through "4" (government declared emergency due to cases spreading in the US) and outlined the next steps in the refinement of the final plan, which is scheduled to be available on line in the near future. He emphasized that the next, critically important, steps involve planning at the school, department, and division level. Tools will be forthcoming from his office to assist in planning in such areas as identifying required staff and dealing with laboratory issues in the event of an extended emergency period.

Dr. Eric Weiss, Associate Professor of Surgery, presented an overview of the Pandemic Influenza Response Plan (PIRP) of Stanford Hospital and Clinics and the Lucile Packard Children's Hospital. The PIRP consists of 14 modules including, among others: surveillance and screening; infection control; inpatient care and clinical guidelines; antivirals/antibiotics/vaccines; triage protocols; surge plan; lab diagnostics; human resources and occupational health; communication and training; security; and influenza care centers. He outlined the phases of a pandemic and the hospital response in each phase and reviewed the recent histories of H5N1 and SARS episodes. Dr. Weiss emphasized the speed with which these infections spread as well as the need to train health care workers in the proper use of protective equipment. He also commented on the collaborative efforts of the hospital and University groups that have been underway to assure the smooth functioning across the institutions of response to a pandemic flu.

Both the University and the hospitals have made enormous progress in their planning efforts. I am very appreciative of these efforts and look forward to the further refinement of the plans, even as I hope that we will not have to implement them.

Earthquake Preparation and Information Links

After being in California for over six years, Monday was my first earthquake experience. This is likely true for many individuals who have joined Stanford since the much more serious Loma Prieta earthquake of 1989. If you are like me, the recent earthquake served as a wake up call. While we have prepared an earthquake emergency kit, etc for our home and while we have rehearsed earthquake preparedness for the university, the actual experience compels one to think through whether one's personal and work preparations are as up-to-date as possible.

As a reminder there are a number of important emergency hotlines at Stanford – and you should be carrying a card with their number with you at all times. To remind you, in case of an earthquake or emergency, bulletins and updates for the Stanford University community will be available on KZSU (90.1 FM) or KCBS (740 AM). The Stanford University Emergency Web Site is <http://emergency.stanford.edu>.

You can also call to hear bulletins and updates at:

- **School of Medicine Emergency** **723 7233**
- **University Announcements** **725 5555**
- **Stanford Hospital & Clinics Bulletins** **498 8888**
- **Lucile Packard Children's Hospital** **497 8888**
- **Student Information in SoM** **725 4600**

You should have these numbers with you at all times.

In addition, Dr Henry Lowe, Senior Associate Dean for Information Resources and Technology alerted me to some useful websites to access should/when another earthquake occurs. The best is http://quake.usgs.gov/recenteqs/Maps/San_Francisco.html

since it is updated rapidly and reports location and magnitude in minutes. If the earthquake is of significant magnitude the site will also contain an “aftershock warning” link.

But most important is to familiarize yourself with the disaster planning procedures in your department and also to review and update your disaster preparations at home. This is a good time to do so.

Update on the Department of Medicine

Also at the November 2nd Executive Committee meeting, Dr. Ralph Horwitz, Arthur L. Bloomfield Professor of Medicine and Chair of the Department of Medicine, provided an update on his Department. He has provided this summary of his remarks.

The Department of Medicine comprises 145 full-time faculty distributed across 14 divisions. Among the 125 AAMC Medical Schools, Stanford's department ranks 63rd in size, but is second in NIH research dollars per faculty FTE. Our faculty are notable for their prominence with 41 members of the American Society for Clinical Investigation, 26 of the Association of American Physicians, and 13 members of the Institute of Medicine.

Several years ago, the Department's leadership identified research goals in disease based research, patient-oriented sciences, enabling technologies, and device development. More recently, the Department has established research focus in three major areas: Genomic Medicine, Immunology, and Patient/Population research. In Genomic Medicine, the department has initiated a proposal to establish a Center for Genomic Medicine in collaboration with the Dean's office and several other departments. The goals of the Center are to build upon and substantially expand Human Genetics research at Stanford and to attract an increasing number of physician investigators to studies of the role that genetics plays both in the risk for developing disease and in determining treatment response. Along with other departments and centers at Stanford, Medicine is also actively engaged in strengthening our capability in the evolving field of "personalized" medicine.

A great Department of Medicine must also have a robust program of patient and population based research. The focus of these programs in the department extends across the full spectrum of research, including prevention, diagnosis, prognosis and therapy. The research methods require both experimental and observational designs and a cutting edge application of statistical methods (we are fortunate to have a superb faculty in Health Research and Policy who are among the nation's leaders in the design and analysis of research). Unlike research in laboratory sciences where creativity is often noted in the development of hypotheses, creativity in patient/population research is often reflected in the methodologic invention that enables valid, reproducible and generalizable results. The Department is actively recruiting both senior and junior faculty to enhance these programs of research.

In education, the Department has plans for a renewed commitment to national leadership. Recent faculty recruitments will enable the department to promote an emphasis on the craft of Medicine and to highlight research education as a core value. Recognizing that

many of our students and residents are clamoring for experiences in International Health, we are actively pursuing new and expanded opportunities for clinical rotations in the developing world.

The clinical programs of the department have grown substantially these past several years and the faculty are now focusing greater attention than ever on measures of clinical quality. We do so knowing that we cannot be a great department unless we practice superb clinical medicine. We do so, too, believing that the practice of Medicine is the most ennobling aspect of the Profession of Medicine. The Department of Medicine must always celebrate and reward the achievements of our outstanding physicians whose dedication to clinical care honors our duty to our patients and the broader society.

Some Notable Events

Honoring Past Leaders: On October 25th we hosted a dinner in my home to thank and celebrate some of the past leaders of the School of Medicine and Medical Center. We will be having a number of events during the next two years as well to commemorate, first, in 2008, the centennial of the School of Medicine and, second, in 2009, the 50 year anniversary of the Medical School's move to the Stanford campus. At this recent event we hosted Dr. Lawrence Crowley, who served as Acting Dean of the School of Medicine from 1979-198 and Vice President of the Medical Center from 1980-85, along with Dr. Robert Glaser, who served as Dean from 1965-1970, Dr. Sidney Raffel who served as Acting Dean from 1964-65. Dr. Paul Berg, who prides himself on never having been dean, also joined us. I found the recounting of the challenges and accomplishments of each of these leaders particularly informative. Their similarity to the issues we face today was notable and underscored how much our current efforts build on efforts and successes of these past leaders.

Second Annual Oscar Salvatierra Lectureship in Transplantation was delivered by Dr. Thomas E Starzl on Thursday October 25th. Dr. Starzl, Professor of Surgery, University of Pittsburgh, is one of the pioneers of transplantation during the 20th century, whose contributions to research, training and patient care have been nonpareil. In his lecture entitled "The Biological Basis of Transplantation" Dr. Starzl highlighted some of the seminal contributions made by Stanford faculty members during the past several decades to the present and discussed some of the exciting opportunities that lie ahead – and where Stanford leaders will surely continue to make important contributions.

Dr. Harvey Cohen was installed as the Deborah E Addicott- John A Kriewall and Elizabeth A Haehl Family Professor at a celebration on October 24th. Dr. Cohen served as the past chair of Pediatrics and is now pursuing exciting work in proteomics related to the diagnosis and prognosis of a number of childhood diseases. This new professorship was created to acknowledge his enormous contributions to LPPH and Stanford and to help support him in his new role as a

professor of pediatrics. I want to thank each of the wonderful individuals whose contributions made this professorship possible.

Pediatric Faculty Begin Strategic Planning: In anticipation of his arrival on January 2, Dr. Hugh O'Brodovich, the next chair of Pediatrics at Stanford and LPCH, held an all day retreat of the pediatric faculty to begin charting the future the department. The focus was on faculty development with a particular emphasis on junior faculty and their important roles in the department and institution. While there is no doubt that pediatrics and LPCH have made considerable strides in prominence during the past decade, it seems clear that another series of major programmatic initiatives will be soon launched by Dr. O'Brodovich – which promises exciting opportunities for Stanford and our community.

Awards and Honors

Thomas Rando, Associate Professor of Neurology and Neurological Sciences and Deputy Director, Stanford Center on Longevity, was honored recently in Halle, Germany for his research on stem cells and aging. He was the Keynote Lecturer and Schober Award recipient at the International Symposium on Tissue Aging held at the Martin Luther University Halle, Germany. The symposium was organized by the Department of Cardiothoracic Surgery and the Department of Cardiology in cooperation with the German Society of Thoracic and Cardiovascular Surgery and the German Society of Gerontology and Geriatrics. Congratulations, Dr. Rando.

Christina Swanson, PhD student in Dr. William Robinson's laboratory, and **Michael Thomas Wong**, PhD student in Dr. PJ Utz's laboratory, have been selected as the 2007-08 Mason Case Fellows in the Biosciences. Ms. Swanson's research project is on tryosine kinase inhibitors for the treatment of rheumatoid arthritis. Mr. Wong will study the cytokines and soluble factors that drive IL-17 production in human CD4+ T cells.

Jonathan Riboh, a Stanford Medical Student, was awarded the Joseph Boyes Award for Best Scientific Paper at the 2007 Annual Meeting of the American Society for Surgery of the Hand. Congratulations, Jonathan.

Appointments and Promotions

Ingrid Aalami has been reappointed as Clinical Assistant Professor (Affiliated) (Obstetrics and Gynecology), effective 9/01/2007.

Bernard W. Dannenberg has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine), effective 9/01/2007.

Jon Fuller has been promoted as Clinical Associate Professor (Affiliated)(Medicine);, effective 9/01/2007.

Gordon S. Kaplan has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine), effective 9/01/2007.

Michael Laufer has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine), effective 9/01/2007.

Quoc Luu has been appointed to Clinical Assistant Professor (Radiation Oncology; Radiation Therapy), effective 10/29/2007.

Raj Mitra has been reappointed to Clinical Assistant Professor (Orthopedic Surgery), effective 11/01/2007.

Susan Price has been reappointed as Clinical Assistant Professor (Affiliated)(Medicine); effective 9/01/2007.

Elizabeth H. Raphael has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine); effective 9/01/2007.

Joseph Ryan has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine), effective 9/01/2007.

Carla Shnier has been reappointed to Clinical Assistant Professor (Anesthesia), effective 11/01/2007.

Martin Wong has been promoted to Clinical Associate Professor (Affiliated) (Obstetrics and Gynecology), effective 9/01/2007.

Ken Zafren has been reappointed as Clinical Assistant Professor (Surgery, Emergency Medicine), effective 9/01/2007.

Dean's Newsletter

November 19, 2007

Revitalization of the Nation's Physician-Scientist Workforce

One of the primary goals of our efforts in medical education at Stanford is the training of future physician scholars, scientists and leaders. In our new curriculum and our other efforts across the education and training domains of the medical school we are committed to addressing these vital members of the medical and scientific workforce (see <http://med.stanford.edu/md/>). Over the past decade much concern has been expressed

about the attrition in the numbers of clinical investigators. Goldstein and Brown highlighted this concern a decade ago in their now classic editorial entitled “The Clinical Investigator: Bewitched, Bothered, and Bewildered – but Still Beloved” (*J Clin Invest* 1997; 99: 2803-2812). During the ensuing years a number of programs and initiatives have been put into place to address the decreasing numbers of physicians who focus their careers on research – but concern remains and is now heightened by the current NIH funding climate along with a number of other factors. I was pleased therefore to participate in a meeting on November 15th that was organized and sponsored by the Association of Professors of Medicine (APM) to address the “Revitalization of the Nation’s Physician-Scientist Workforce.” During this energetic and highly interactive meeting, which engaged nearly one hundred national leaders, the current state of affairs and a range of challenges and potential solutions and initiatives were discussed and debated.

Dr. Tim Ley, Professor of Medicine at Washington University, described the current state of affairs. His remarks were based on data he gathered from various sources to update his review with Leon Rosenberg entitled “The Physician-Scientist Career Pipeline in 2005: Build It and They Will Come” (*JAMA* 2005;294:1343-51). Importantly, he noted that the supply of physician-scientists is at “steady state” but is potentially negatively impacted by a number of factors, including age, gender and level of indebtedness. Ley estimates that there are currently some 15,000 physician-scientists in the USA (nearly double of that of 25 years ago) and that approximately 500-1000 new physician-scientists need to enter the pipeline each year to maintain steady state. However, he also noted that the current cohort of physician-scientists is aging and that more than 50% will be greater than 50 years of age within the next year.

One of the major positive changes that has occurred during this time period has been the increasing number of women entering medicine. A number of women enter MD/PhD programs or initially plan careers as physician-scientists. However, as we unfortunately know all too well, the numbers of women in academic medicine decline over time, with all too few reaching professorial appointments. This clearly has very negative implications both for even maintaining the physician-scientist workforce at steady state and for sustaining the integrity of medicine as a profession. A similar trend is also true for underrepresented in medicine minorities, although here the problem is worsened by the fact that far too few minorities enter medicine and scientific career paths. A number of other factors may also impact career choice, including future predicted compensation and life-style, among others. The goal of the APM meeting was to highlight the challenges and foster dialogue that could lead to action-oriented recommendations. Accordingly, a series of topics were the focus of small group discussions, including:

- Attracting and retaining women physician-scientists
- Recruiting underrepresented minority physician-scientists
- Selection processes and education programs for physician-scientists
- Combined degree (MD-PhD) programs
- Effects of generational changes on the future physician-scientist workforce
- Mentoring and enhancing programs to nurture late bloomers

- Supporting physician-scientists in the transition from the K award to first R01
- Supporting physician-scientists in the transition from the first R01 to second (competing) R01
- Competitive compensation mechanisms for physician-scientists
- Organizing initiatives at academic health centers to facilitate the development of physician-scientists

I participated in, as well as chaired a couple of these workgroups and was engaged in the preparation of group reports that will be assimilated, processed, and circulated for further refinement and prioritization before being forged into an action plan by the APM. Of course I will share the results of these discussions with you as they develop and evolve.

But this is a discussion that needs to extend beyond the APM and that also needs institutional dialogue. While I feel that we at Stanford are certainly in the lead compared to peer institutions in the breadth and depth of programs we have put into place to foster the development of physician-scientists and scholars – something that is very positively impacted by the outstanding research environment that exists here – it is also clear that we have much to do to further improve our efforts. I recently asked a faculty leadership group to review our efforts in training physician scientists, not only at the student level but also at the residency, fellow and junior faculty levels. I am certain that we can make progress in improving our success – and that it is important and even imperative for us to do so. But I am also convinced that this is an issue that deserves new and creative thinking, especially in view of the challenges now existing in our health care and funding climates. I welcome thoughts and suggestions from the members of our Stanford community.

Professional and Personal Ethics: A Continuing Discussion

I have spoken and written in the past about the ethical and professional issues in medicine. I have been particularly concerned about the increasing commercialization of medicine and about conflicts of interest emerging from academic-industry relationships that have focused on marketing rather than research and development. I had the opportunity to discuss some of the issues at a recent Ethics @ Noon Lecture Series and also at a meeting of the Association of Academic Health Centers on November 16th.

The provision of gifts and compensation to physicians from industry – for meals, travel, consulting, continuing medical education, etc – has come under increased public scrutiny during the past several years. This activity reached a new level of significance on September 6th when Senator Charles Grassley (R-IA) and Herb Kohl (D-WI) introduced the *Physician Payments Sunshine Act*. According to co-sponsor Charles Schumer (D-NY), the purpose of this proposed law is to “shine a much needed ray of sunlight on a situation that contributes to the exorbitant cost of health care.” Laws requiring pharmaceutical and medical device industries to publicly report payments to doctors already exist in Minnesota and Vermont and are being enacted in other states. Based on recent inquiries and investigations, including those at the Congressional level, there is ample evidence that this issue is continuing to heat up.

There are reasons why legislators and regulators have raised concerns. In a report this past year by Campbell et al entitled “A National Survey of Physician-Industry Relations” (*N Engl J Med* 2007;356: 1742-50) data were presented that showed that 94% of physicians across multiple specialties have some type of financial relationship with industry. Most common are free gifts, meals, drug samples as well as reimbursements for travel to professional meetings or continuing medical education. As I discussed when we introduced our policies in 2006 banning many of these gifts and financial relationships (see <http://med.stanford.edu/coi/siip>), most physicians do not believe that they are influenced by such gifts, although many posit that colleagues or co-workers might be. This is not dissimilar to the recent report of significant industry associations by the majority of clinical department chairs across the country, wherein the chairs believe that they are free of conflicts, but co-workers and trainees frequently feel otherwise (see Campbell EG et al, “Institutional Academic-Industry Relationships” *JAMA* 2007;298:1779-1786.)

The phenomena whereby individuals believe they are free from influence and operate with the highest personal integrity – even when accepting favors or sometimes deviating (even if in small ways) from truthfulness - are apparently well described in the neuroscience, psychology and economics literature. At the aforementioned meeting of the AAHC that I chaired on November 16th, Dr. David Korn, Senior Vice President at the Association of American Medical Colleges (AAMC) and former Dean of the Stanford University School of Medicine, spoke about this scientific evidence in reference to a symposium AAMC sponsored in June 2007 entitled “The Scientific Basis of Influence and Reciprocity,” the results of which will be published shortly. Depending on the discipline, this phenomenon (wherein one feels free of influence despite potential evidence to the contrary) is referred to as “delusion without intention” or the “dishonesty of honest people.” According to experts in this field, the size of the gift is less important than the relationship with the gift giver and is associated with an internal mechanism of “wiggle room,” in which an individual can engage in varying levels of even unethical behavior without a perceived loss of personal integrity. Others have also noted that the ability of gifts to influence behavior is well recognized and is one of the reasons why industry invests tens of billions of dollars annually in gifts and favors as part of their interactions with the medical profession.

Of course I fully recognize that these are challenging issues and that individuals within the medical and scientific professions will have strong reactions to any suggestion that they are subject to influence or bias. But the data – both scientific and in marketing practices – speaks otherwise and compels us to examine how we conduct our relationships. What is increasingly clear is that the failure of the medical profession to effectively do this will likely result in others – including the federal government – establishing policies or restrictions. That would be unfortunate. These issues warrant our continued reflection and discussion.

Thanking and Honoring Our Stanford Staff

There aren't enough ways to thank the dedicated staff who work on behalf of the School of Medicine and University. Without their many contributions, our grand missions in education, research, patient care and community service would not reach the levels of excellence that we enjoy today. I hope that each of us remembers to regularly and frequently thank those who work with us or on our behalf to support the activities of our students, faculty and staff. Thankfully, we also have the great tradition of honoring employees who have provided five or more years of service under the banner of the Dean's Staff Recognition Dinner. This year's celebration was held on November 8th at the Faculty Club. While I have had the privilege of attending all prior events since I came to Stanford, I was not able to participate this year due to a family emergency. But I want to take this opportunity to thank all those who achieved a five-year (or its multiple thereof) anniversary as a member of our staff. All of our staff members –including you - are appreciated. Accordingly, I want to list two groups: first, the winners of the SPIRIT Award for 2007 and second, those staff members who have worked for the University and Medical School for 20 or more years (a remarkable accomplishment).

This is the 8th year of the SPIRIT Award, which recognizes two staff members for their consistent dedication, initiative, motivation, positive attitude and customer service. Needless to say, many more than two individuals are deserving of special recognition, but I do want to highlight this years winners:

- **Mr. Jim Day**, Visual Art Services and
- **Ms. Diane Stafett**, Department of Medicine

You can read more about their personal stories and contributions in the Stanford Report (see: <http://news-service.stanford.edu/news/2007/november14/med-spirit-111407.html>).

I also want to specifically mention those staff members who have been part of the Stanford community for 20 or more years. As I get closer to completing my 7th year at Stanford I have ever more respect and admiration for those who have contributed so much of their professional lives to our medical school. These include:

45 Years of Service (wow!)

<i>June Hoshi</i>	Department of Biochemistry
--------------------------	----------------------------

35 Years of Service

<i>Geraldine Derby</i>	Department of Medicine – Nephrology
<i>Barbara Hill</i>	Department of Developmental Biology
<i>Nancy Houston-Miller</i>	Department of Medicine – Cardiovascular
<i>Wendy Long</i>	Department of Pathology – Blood Center
<i>Melchor Madrigal</i>	Department of Comparative Medicine
<i>Zera Murphy</i>	Educational Programs and Services
<i>Lynne Olds</i>	Department of Pediatrics
<i>Richard Stovel</i>	Department of Genetics

30 Years of Service

<i>Joan Bialek</i>	Department of Medicine – Cardiovascular
<i>Ella Doyle</i>	Department of Microbiology & Immunology
<i>Shirley Feldman</i>	Department of Psychiatry
<i>Dolly Kagawa</i>	Department of Surgery
<i>Sheryl Kendall</i>	Finance & Administration
<i>Paula Louie</i>	Department of Radiation Oncology
<i>Mary Palmer</i>	Research Management Group
<i>Debra Scheuch</i>	Finance & Administration
<i>Laural Sledge</i>	Office of Medical Development

25 Years of Service

<i>Wendy Baumgardner</i>	Department of Radiology
<i>Catherine Carswell-Crumpton</i>	Department of Microbiology & Immunology – Baxter Laboratory
<i>Cecelia Coker</i>	Department of Surgery
<i>Ruth Colombo</i>	Department of Pediatrics
<i>Sussan Dejbakhsh-Jones</i>	Department of Medicine – Immunology & Rheumatology
<i>Susan Goodrich</i>	Department of Radiation Oncology
<i>Joyce Hages</i>	Department of Medicine – Cardiovascular
<i>Susan Hoerger</i>	Human Resource Group
<i>Lisa Joo</i>	Academic Affairs
<i>Mahmonir Keyhan</i>	Department of Microbiology & Immunology
<i>Linda McLaughlin</i>	Department of Pediatrics
<i>Elizabeth Pope</i>	Department of Cardiothoracic Surgery
<i>Jan Saryusz-Romiszewski</i>	Department of Radiation Oncology
<i>Behnaz Taidi</i>	Department of Medicine – Oncology
<i>Rosario Villacorta</i>	Department of Medicine – Immunology & Rheumatology
<i>Kuo-Mei Wang</i>	Department of Pathology
<i>Valerie Williams</i>	Department of Medicine
<i>Reese Zasio</i>	Department of Comparative Medicine

20 Years of Service

<i>Julie Brewster</i>	Department of Otolaryngology – Head & Neck Surgery
<i>Virginia Chambers</i>	Department of Biochemistry
<i>Sharon Clarke</i>	Department of Radiation Oncology
<i>Jo-Ann Cuevas</i>	Human Resource Group
<i>Marcos Figueroa</i>	Lane Medical Library
<i>Patricia French</i>	Lane Medical Library
<i>Stephen Gladfelter</i>	Visual Arts Services
<i>Gail Gong</i>	Department of Health Research & Policy
<i>Miriam Guzman</i>	Department of Pathology – Blood Center
<i>Michel King</i>	Institutes of Medicine

<i>Lorie Langdon</i>	Educational Programs and Services
<i>Lilibeth Lorenzo-Fernando</i>	Department of Pathology – Blood Center
<i>Gladys Morales</i>	Research Management Group
<i>Jeffrey Myll</i>	Department of Medicine – SPRC
<i>Bita Nouriani</i>	Department of Psychiatry
<i>Karla Palmeri</i>	Institutes of Medicine
<i>Pamela Rawls</i>	Department of Orthopaedic Surgery
<i>Anca Ruhlen</i>	Department of Genetics
<i>Vida Skokoohi</i>	Department of Genetics
<i>Leigh Stacy</i>	Department of Pathology
<i>Nengchee Teo</i>	Department of Medicine – Cardiovascular
<i>Jane Volk-Brew</i>	Academic Affairs
<i>Cheryl Yemoto</i>	Health & Safety

Again, congratulations and thanks to all – and, as they say, let's hope for many more years to come!

NIH Funding Vetoed by President

In the last issue of the Dean's Newsletter I commented on the hoped-for approval of the Labor-HHS-Education appropriations bill, which would have carried a modest increase of \$30 billion for the NIH budget, which would still have been below inflation. Unfortunately, President Bush vetoed this appropriation bill on November 14th, despite its bipartisan support and commitment to investment in biomedical research. This legislation would also have provided \$212 million for the title VII funds to enhance the diversity of health professionals – something else we worked hard to have in the bill. Coupled with the veto of SCHIP that you are well aware of, this current veto further impacts our ability to sustain our research mission and diversity pipelines. While we all recognize the politics involved, it is tragic to have these played out over critical investments in innovation and research. Unfortunately, the attempt to override the veto on November 15th also failed – falling two votes short of the two-thirds majority needed to override the veto. This is a very sad state of affairs – and, in many ways, it is a further loss for American science and medicine.

Our Changing Landscape

No doubt can remain that we are entering a new phase in the medical school landscape. This past week the 30 year old Fairchild Auditorium proceeded through its demolition to make way for the new Learning and Knowledge Center (LKC). With this, the visible evidence of the transformation of our medical school campus is becoming ever more evident. And this will be continuing in various stages over the next decade. With the upcoming centennial of the Medical School in 2008 and the 50th Anniversary of the move of the School to the Stanford campus in 2009 in mind, it is particularly gratifying that there is now visible evidence of a new beginning – and one that we hope will exemplify Stanford as a center of excellence in education and research for many decades to come. You can follow the construction plans for the LKC by going to <http://lkc.stanford.edu/>.

New Program for Medical Students Announced

Dr. Charles Prober, Senior Associate Dean for Medical Student Education, has let me know that his office is launching a new program for medical students called Educators-4-CARE (E4C). This program, which was first discussed in the Spring 2007 Medical Education Newsletter, aims to foster the development in each of our students of four key qualities embodied in thoughtful and effective physicians: Compassion, Advocacy, Responsibility and Empathy (CARE).

Stanford faculty elected to participate in the E4C program will be identified over the next 6 to 9 months. Each faculty member, working from a shared curriculum, will guide five to six students from each class through their acquisition and refinement of clinical skills. Patient-centered medical interviewing, bedside physical diagnosis, and evidence-based practice will be core features of the instruction. A student's E4C faculty mentor will serve as an ongoing role model for professionalism and the doctor-patient interaction throughout the student's time at Stanford.

Educators-4-CARE promises to be an exceedingly valuable addition to our medical school curriculum, and I look forward to seeing its further realization in the months ahead.

Update on the Stanford Hospital and Clinics (SHC) electronic health record project (CIS-Epic)

I have received the following update on current activities at the Stanford Hospital and Clinics that are going on to assure that SHC is ready for the launch of Epic, SHC's new electronic health record system, which is scheduled for February 29, 2008. These include the following:

- **Training**
Epic training begins on November 26 for nurses and on December 1 for physicians. All classroom-based training occurs at the North Campus location and there is a free shuttle service available from the hospital to the North Campus.
- **SuperUsers**
There is a large group of staff and physicians who are trained as SuperUsers to assist in helping their peers get ready for Epic. SuperUsers consist of staff members and physicians from every department within the hospital and clinics, as well as representatives from IT, Learning Services and Epic. This group of individuals has been highly trained in CIS-Epic to help others in their departments understand the system and use it proficiently. SuperUsers will play a major role in helping end users get ready for the new electronic health record system.
- **Triads**
Another way the CIS-Epic management team is preparing SHC for the conversion to an electronic health record is by the creation of triads. These leadership-driven groups consist of the director of a specific area, a physician leader who is

partnered with the triad leader and a content expert (someone who knows Epic and Stanford operations). Their goal is to drive the implementation of CIS-Epic at SHC. In all, there are 30 triads engaged in the process. The triads are addressing the gaps that exist between the current and future systems, taking ownership of the workflow changes and implementing the changes necessary to be ready for the new workflows.

More information about the preparations for the Epic launch will be forthcoming from SHC.

More on Transcription

Stanford Hospital & Clinics (SHC) also asked me to include the following update in this edition of the Newsletter:

SHC continues its rollout of the new Spheris dictation and transcription system in preparation for the Epic electronic health record launch, which as noted above, is scheduled for February 29, 2008. On November 12th, the final SHC clinical area group began to use the new system. Menlo Medical Clinic is scheduled as the final area to activate on the new system, beginning November 27th.

As of November 11th, more than 22,000 dictations had been completed in Spheris. Documents have been assigned transcription turnaround times based on their importance to patient care, ranging from two hours to 24 hours. Dictation continues as before with some minor changes, which are designed to ensure that transcriptions appear seamlessly in CareCast (and as it goes live, in Epic). Watch other SHC communications for Spheris updates, as well as preparations for Epic.

Awards and Honors

McCormick Awardees: The School of Medicine and the Office of Diversity and Leadership are pleased to announce the recipients of the 2007 McCormick Awards. These awards provide research/project funding to junior faculty women pursuing advancement, or to junior faculty men or women who support the advancement of women in medicine and/or medical research. The awards are supported by the McCormick Funds, which were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research. This year 29 applications were submitted and the winners were chosen by a review committee that included: Craig Albanese, Marcia Stefanick, Alice Whittemore, Ray Gaeta, Claudia Morgan, and Hannah Valantine. Three award winners each year will receive \$30,000 per year for two years.

This years McCormick Award winners include

- *Anne Brunet*, PhD, Department of Genetics
- *Jennifer Cochran*, PhD, Department of Bioengineering
- *Amreen Husain*, MD, Department of Obstetrics and Gynecology

Congratulations to each.

Burt and Marion Professorships. On November 5th we had the opportunity to celebrate the awarding of two Burt and Marion Professorships in Immunology. We were joined by members of the Avery family and faculty leaders in immunology and microbiology. The two Burt and Marion Avery Professors are:

- *Dr. Mark Davis*
- *Dr. Yueh-hsiu Chen*

Congratulations to both Drs. Davis and Chen – and special thanks to the Avery family.

The American Institute for Medical and Biological Engineering elected three of our faculty as Fellows, including:

- *Russ Altman, Professor of Bioengineering and of Genetics*
- *Steve Quake, Professor of Bioengineering*
- *Charles A. Taylor, Associate Professor of Bioengineering and of Mechanical Engineering and Radiology*

Congratulations to each.

I. Robert Lehman, Professor Emeritus of Biochemistry has been awarded the 2008 Herbert Tabor/Journal of Biological Chemistry Lectureship to be presented at the 2008 Annual meeting of the American Association of Biochemistry and Molecular Biology in March 2008. Congratulations to Dr. Lehman.

Donna Cronister, administrative services manager for the Radiological Sciences Laboratory (RSL), was honored as this year's recipient of the Marsh O'Neill Award. Since 1990, the Dean of Research Office has given the Marsh O'Neill Award annually to a staff member who has provided exceptional support for research at the University. Congratulations to Donna.

Jonathan S. Berek, MD, MMS, Professor and Chair, Department of Obstetrics and Gynecology and Division of Gynecologic Oncology, Stanford Cancer Center, has been elected to the Presidency of the International Gynecological Cancer Society (IGCS) for 2008-2010. The IGCS is the world's largest group that is dedicated to research and treatment of gynecologic malignancies. Dr. Berek has also been elected to the Commission on Cancer of the American College of Surgeons for a 3-year term.

Appointments and Promotions

- **Timothy P. Angelotti** has been promoted to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 11/01/07.
- **Michele P. Calos** has been promoted to Professor of Genetics, effective 11/1/07.
- **Drew Endy** has been appointed to Assistant Professor of Bioengineering, effective 6/01/08.
- **Jason R. Gotlib** has been reappointed to Assistant Professor of Medicine (Hematology) at the Stanford University Medical Center, effective 1/1/08.
- **Dimitre H. Hristov** has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 11/1/07.
- **Robert Lowsky** has been promoted to Associate Professor of Medicine (Blood and Marrow Transplantation) at the Stanford University Medical Center, effective 11/1/07.
- **Sean Mackey** has been promoted to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 11/1/07.
- **John D. MacKenzie** has been appointed to Assistant Professor of Radiology at the Lucile Salter Packard Children's Hospital, effective 11/1/07.
- **Claude M. Nagamine** has been appointed to Assistant Professor of Comparative Medicine at the Veterinary Service Center, effective 3/1/08.
- **Olaf Reinhartz** has been appointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center and the Lucile Salter Packard Children's Hospital, effective 11/1/07.
- **Audrey Shafer** has been promoted to Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 11/1/07.
- **Weiva Sieh** has been appointed to Assistant Professor of Health Research and Policy, effective 11/1/07.
- **Christina Smolke** has been appointed to Assistant Professor of Bioengineering, effective 6/1/08.
- **Hua Tang** has been appointed to Assistant Professor of Genetics, effective 11/1/07.
- **Abraham Verghese** has been appointed to Professor of Medicine (General Internal Medicine and Infectious Diseases), effective 11/1/07.

Dean's Newsletter December 3, 2007

The Medical Center Expansion Project: Update 2007

On Monday evening November 26th, Medical Center leaders and more than 150 residents and community leaders filled the Palo Alto City Council chambers for the next stage in the process to expand the Stanford University Medical Center in net square feet and in the height of some of the hospital facilities. As I have presented in prior discussions, the

Medical Center replacement plan currently calls for the rebuilding of Stanford Hospital & Clinics (SHC) as a seven-story structure that would increase the number of beds from the current 466 to 600. Importantly, the replacement would meet mandated seismic requirements, create a facility that would offer single bed rooms for patients, expand the number and size of operating rooms to permit the use of new technologies, proportionally increase the number of intensive care beds and transform and expand the emergency facilities that serve both SHC and the Lucile Packard Children's Hospital (LPCH). In tandem with the rebuilding of SHC, the Lucile Packard Children's Hospital would increase its bed capacity by adding 104 patient beds, which would bring its total to 361 beds on the Medical Center site.

These expansions in bed capacity are driven by significantly increased demands for patient care at both SHC and LPCH, and they reflect changes in patient demography as well as the current and projected programs of the community, faculty and the Medical School. The plan, at its heart, permits the realization of our overall goal of *Translating Discoveries* – bringing knowledge from research to the benefit of adults and children in our community and beyond.

The November 26th City Council meeting included testimonials and comments from over 40 individuals, the vast majority of whom supported the plans for the Medical Center expansion and the requisite rezoning requirements to make it happen (see update in the *Stanford Report*). Along with Martha Marsh, CEO of SHC, and Chris Dawes, CEO of LPCH, I spoke at the meeting. My remarks were in support of the hospital plans as well as the Medical School's replacement of the Grant, Alway, Lane and Edwards Buildings by the new Foundations in Medicine facilities. I also spoke of the importance of the Medical School and hospitals to each other and to our community. I must confess that, while I am sensitive to concerns about maintaining the integrity of the greater Palo Alto community, I find it mind-boggling to hear from individuals who have little to no regard for what the Medical Center brings to their community.

In my comments I analogized this attitude to the Frank Capra movie "*It's A Wonderful Life*," which will show at the Stanford Theater on December 24th. In this classic film, the protagonist, George Bailey, has the opportunity to witness what his community would have been like if he had not been born. In a similar fashion, it is not inappropriate to consider what Palo Alto – and Stanford – would be like today if visionary University and community leaders had not moved the Medical School from San Francisco to the Stanford campus nearly 50 years ago. Simply put, many of the extraordinary discoveries in bioscience and remarkable innovations in technology that have transformed our understanding of human biology and disease and have led to countless translations of basic research to improve the diagnosis, treatment and prevention of human disease would not have happened without Stanford.

For example, Stanford faculty have transformed medicine and science through their fundamental discoveries in genetics that ultimately led to genetic engineering, to the sequencing of the human genome, and to the ability to display thousands of genes on a chip and discern their state of activation and correlation with various disease states.

Collaborations between Stanford's biomedical, engineering and physical scientists have led to highly original and far-reaching innovations, including the very foundations of magnetic imaging, the development of the linear accelerator, and the invention of the fluorescent activated cell sorter, among many others.

The countless fundamental discoveries by Stanford faculty in such fields as microbiology, immunology, molecular and cellular biology, biophysics and structural biology, developmental biology and the emerging fields of bioengineering, chemical and systems biology are nonpareil. And collaborations of basic and clinical scientists have resulted in startling discoveries in stem cell biology and the emerging field of regenerative medicine, which are changing the ways we think about cancer, neurobiology, and virtually every organ system. These discoveries and innovations by Stanford faculty have reshaped the fields of cancer, cardiovascular medicine and surgery, neuroscience, and transplantation, as well as immunology, infectious disease and numerous other disciplines – and they have the potential to do so with even greater impact in the years and decades ahead.

While advances in these and related fields have of course occurred at academic medical centers, universities and biomedical research centers around the world, Stanford faculty have often nucleated new disciplines with startling insights and seminal discoveries. A considerable number of these have directly resulted in benefits uniquely available at SHC and LPCH – immediately impacting the care of individuals in our community. Just as with George Bailey, had the community of Palo Alto rejected the move of the Medical School 50 years ago, it would have a very different “life” today. From my perspective, Palo Alto would be a dramatically different community if Stanford was not located in its midst. And, most importantly, the health and well being of both adults and children in our community would not be as well served.

With that in mind, the decisions that will be made by the City Council and the citizens of Palo Alto regarding the Medical Center expansion will have an enormous impact on the future of the community. One would hope that 50 years hence the child or grandchild of a current member of the Palo Alto leadership would not have to ask why her or his parent or grandparent made a decision that had so negatively impacted their personal health or that of their family or community. Fortunately that won't happen if Stanford Medicine continues to live and thrive in Palo Alto – and if George Bailey and “*It's A Wonderful Life*” continue their annual reminder in the decades to come.

NIH and Bioscience

The National Institutes of Health (NIH) and academic centers like Stanford are struggling with the downturn in funding and the perceived opportunities for academic careers for biomedical scientists. In recently compiled data from the NIH, some worrisome trends are clearly defined:

1980

1998

2006

<i>Number and average age of NIH Principal Investigator (PI)</i>	14, 887 39.1 yrs	17,761 42.7 yrs	25,419 50.8 yrs
<i>Number and average age of new PIs</i>	1,843 37.2 yrs	1,355 39.0 yrs	1,346 42.4
<i>Number of Medical School faculty positions</i>	53,552	73,413	121,468
<i>Average age of Medical School faculty</i>	43.1	45.2	48.7
<i>Average age of first time Assistant Professor</i>	33.9	35.4	37.7

While it is notable that the numbers of both faculty positions and grants increased in the post-NIH doubling phase that began in 1998 and ended in 2003, it is of course worrisome to note as well the fact that the number of new PIs in 2006 is no different from that in 1998 – perhaps reflecting the impact of current funding declines and the competition for new RO1 awards. Equally disturbing is the rising age of medical school faculty and, most importantly, the time it takes to become a first time Assistant Professor. The major question at the heart of the current situation is whether the current climate will discourage promising young students from entering the bioscience career pathway and, in particular, whether there will be opportunities for them in academia in the future proportionate to their numbers and excellence.

There is no question that the NIH and academic medical centers are united in their concerns about the future and about the need to increase funding, at least to keep pace with inflation (which has proven unsuccessful during the past 4 years) as well as in the need to assure that promising young PhDs and biomedical scientists have career opportunities and pathways accessible to them. I have previously written about our alignments with industry to foster the connections between research and development and the agenda of innovation (see: http://deansnewsletter.stanford.edu/archive/04_09_07.html#2). But that is just one component of what must be a national advocacy movement that unites universities, professional organizations and societies with industry and community leaders to advocate for the NIH and federally supported research. We all recognize the challenges, given the nation's economic limitations and political agendas – but 2008 offers some opportunity to address both of these, hopefully in more successful ways.

While national planning and advocacy are essential, so too is institutional reflection about the support for graduate student education, postdoctoral training, faculty career development and the investments in biomedical research. I am deeply committed to doing all that we can to foster and support our students and faculty – and we will be shaping our

agenda for our efforts at the School's Annual Leadership Retreat at the end of January 2008, which will focus on "*Quality and Balance*." In anticipation of that planning exercise I am interested in comments from you about how to advance our efforts at Stanford in the biosciences, recognizing that we are a small – but incredibly important – part of the global scene.

Questions on the Cost of Research

A comment of mine in the November 5th Newsletter under the heading of "*NIH Funding and Peer Review*" generated a number of questions and comments. On the topic of the funding of the research mission, I stated:

"Research is obviously an important mission that has many important dividends, but it requires significant institutional support since research per se is not a revenue generating operation. We know this to be true at Stanford, where, despite the enormous success of our faculty in receiving peer-reviewed NIH funding (in fact the highest amount per faculty member of any medical school in the nation), every dollar brought in through research requires nearly 30 cents of institutional support. One can say that, viewed simplistically, the larger and more extensive the research enterprise, the more institutional support required."

Our major source of funding at Stanford is sponsored research, most of which comes from the NIH. This comes with the NIH overhead referred to as indirects – which is an institutionally negotiated percentage of the direct research dollars (that which goes to the investigator). However, indirects do not cover the full costs of research since the government assumes that there will be an institutional contribution to the overall costs. This is compounded by the fact that the costs of running a research operation include additional expenses not covered at all by NIH or other funding agencies. Among these costs are: salaries that may exceed the NIH cap; administrative expenses (many of which have risen in recent years due to compliance issues); the costs for recruitment, retention, and interim research funding of new faculty; graduate student tuition and stipends, especially under the new tuition cap; covering the lesser overhead reimbursements of training and most foundation grants; and costs for renovations and building. Thus, on the average, as great as Stanford scientists are in receiving competitive grants (even in tough times) there are many costs which in the aggregate add up to major funding needs from non-grant sources. We are able to do this - but it is true that the larger our research portfolio, the more we have to expend on research. Centers that have not anticipated this or that receive lower proportional funding from NIH or are simply less productive, expend even more - and in these tough times, can get into trouble.

The Dean's Office did a study in 2003 of the cost to the School of the research mission. Julia Tussing, Managing Director of Finance and Administration, presented the results of the study to the Executive Committee in June of 2003. There are many ways to approach such a study, as demonstrated by several other schools with whom we exchanged ideas and methodologies, and each will give somewhat different answers; we used two different methodologies to establish a minimum and maximum number, and averaged the

two to come up with an “investment” by the School in research of \$85M or 29% of the direct costs spent of sponsored projects. Of the \$85M investment the School made, spending on patent income accounts made up 2.4%, endowment accounts were 6.5%, gifts designated for research accounted for 21.7%, and the remaining 70% came from other School sources. This translates to 28 cents per research dollar spent.

Of course I view these costs as central to our mission and an excellent investment in the future and reputation of our institution, in our ability to attract and retain excellent faculty, and in our ability to teach our students and treat our patients into the future. Indeed without this investment Stanford could not achieve its current level of excellence – and that makes it an essential investment. Put another way, the more successful our faculty become in gaining grant funding, the more successful is the School. The fact that there is a cost associated with the mission is a given; it also costs money to teach students, and in many cases to provide clinical care to our patients.

Thus I want to underscore that my message about the costs of research should not be interpreted as a negative one or one that does not fully acknowledge the extraordinary contributions of our faculty. It is simply an affirmation of what is required to run highly successful school of medicine. Of course, the more efficient we can be, the more we can extend our dollars, and we strive to improve in this area. But no institution that I know of breaks even or comes close to breaking even on research that is primarily government-funded. More importantly, these investments in basic research allow scientists to generate fundamental knowledge – which is the essential underpinning of translating discoveries.

Stanford-Taiwan Biomedical Fellowship Program

Thanks to the vision and leadership of **Dr. Alan Yeung**, Li Ka Shing Professor of Medicine (Cardiology), and **Dr. Peter Fitzgerald**, Professor of Medicine, we signed an agreement with the National Applied Research Laboratories (NARL), a non-profit organization in Taiwan, to establish the Stanford-Taiwan Biomedical Research Program. As part of this agreement NARL will contribute \$2.4 million to establish an interdisciplinary biomedical training program that will focus on cardiovascular medicine but will also interface with disciplines in the Schools of Engineering and the Graduate School of Business as well as biotechnology leaders in Silicon Valley. This agreement represents another in a series of important international interactions focusing on discovery and innovation. The signing agreement included Dr. Feng-Ching Lin, Minister of State, Science and Technology Advisory Group (STAG), the Executive Yuan (the Cabinet) of Taiwan; Dr. Wen-Hsiung Huang, Deputy Minister of the National Science Council; and Dr. Jer-Nan Juang, President of the National Applied Research Laboratories (NARL), along with other government and NARL members.

Remembering Dr. Duncan Govan

On Friday evening November 29th a standing-room only crowd of family, friends and colleagues of Dr. Duncan Eben Govan gathered in the Bechtel Conference Center to commemorate his life and accomplishments. Dr. Linda Dairiki Shortliffe, Stanley

McCormick Memorial Professor and Chair of the Department of Urology, organized and hosted this wonderful celebration – which featured remarks from Robert Chase, Emile Holman Professor of Surgery, Emeritus; Kathy Stamey who read the remarks of her husband, Thomas Stamey, Professor of Urology; Fuad Freiha, Professor of Urology, Emeritus; Robert Kessler, Professor of Urology; Malinda Mitchell, Former President and CEO of Stanford Hospital & Clinics; and Dr. Duncan's children. His wife, Paddy, was in attendance along with his grandchildren. A common theme emerged of an extraordinary physician and surgeon whose life was dedicated to medicine, science and his family and who evidenced enormous integrity and professionalism that won him the respect of the Stanford and international medical community. Dr. Duncan first arrived at Stanford in 1961, and he helped to develop the Department of Urology as well as the newly moved School of Medicine. His legacy lives on in his trainees, colleagues and family – and clearly will continue to do so for generations to come.

Department of Medicine Welcomes New Faculty Leaders

Since Dr. Ralph Horwitz joined Stanford a year ago as the Chair of Medicine and Arthur L Bloomfield Professor of Medicine, he has been working diligently to enrich and enhance the Department of Medicine. In addition to new programs, Dr. Horwitz has recruited a number of departmental leaders, and, on Tuesday evening, November 27th, he hosted a reception in the Schwab Center to welcome three of them. They include:

- **Dr. Glen Chertnow**, Professor of Medicine and Chief of the Division of Nephrology
- **Dr. Pankaj Jay Pasricha**, Professor of Medicine and Chief of the Division of Gastroenterology and Hepatology
- **Dr. Abraham Verghese**, Professor of Medicine and Senior Associate Chair for the newly established program in the Theory and Practice of Medicine.

Each of these are excellent recruitments to Stanford and I ask you to join me in welcoming them – and in thanking Dr. Horwitz for his success in bringing them to Stanford.

The Arthritis Foundation Honors Dr. Irv Weissman

On Thursday evening November 29th, the Arthritis Foundation of Northern California hosted a gala celebration to honor the contributions of **Dr. Irv Weissman**, the Virginia and DK Ludwig Professor of Cancer Biology and Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and the Stanford Cancer Center. For nearly 60 years the Arthritis Foundation has funded education, research and patient care programs focusing on adults and children with arthritis and related inflammatory diseases. Indeed the Foundation is the largest source of private funding for arthritis research in the world. The evening included a wonderfully funny “roast” by producer, writer and director Jerry Zucker, who served as the Master of Ceremonies. I had the opportunity to deliver the evening's keynote address, which was followed by a wonderful video tribute to Dr. Weissman. All of us at Stanford are well aware of Irv's many remarkable accomplishments in science as well as his leadership as an advocate for

research unhindered by politics or religion. It was a wonderful tribute to Irv. Please join me in congratulating Dr. Weissman for yet another major award.

Awards and Honors

Donna Cronister, Administrative Services Manager of Radiological Science Laboratories and Lucas Center for Magnetic Resonance Imaging, has been awarded the 2007 Marsh O'Neill Award. This award, now in its 17th year, is given to staff who make "outstanding contributions" to Stanford's research mission. Congratulations, Donna.

Appointments and Promotions

- **Amy Heerema-McKenney** has been appointed as Clinical Assistant Professor (Pathology), effective 5/01/2008.
- **Shelli Kesler** has been appointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences, effective 12/01/2007.
- **Bruce Linenberg** has been reappointed as Clinical Assistant Professor (Affiliated) (Psychiatry and Behavioral Sciences), effective 9/01/2007.
- **Linda Lotspeich** has been appointed as Clinical Professor (Psychiatry and Behavioral Sciences), effective 1/01/2008.
- **Hugh M. O'Brodovich** has been appointed to Professor of Pediatrics, effective 1/01/2008.
- **Lars Osterberg** has been promoted to Clinical Associate Professor (Medicine), effective 9/01/2007.
- **Hemal Parekh** has been reappointed as Clinical Assistant Professor (Affiliated) (Medicine), effective 9/01/2007.
- **Ellen F. Porzig** has been promoted to Professor (Teaching) of Developmental Biology, effective 12/01/2007.
- **Sunita Sastry** has been promoted to Clinical Associate Professor (Anesthesia), effective 01/01/2008.
- **Scott Soltys** has been promoted to Clinical Assistant Professor (Radiation Oncology), effective 9/01/2007.
- **Payam Tabrizi** has been promoted to Clinical Assistant Professor (Affiliated) (Orthopaedic Surgery), effective 12/01/2007.

- **Andrea Tom** has been appointed as Clinical Assistant Professor (Affiliated)(Medicine), effective, 12/01/2007.
- **Charlie Young** has been reappoint as Clinical Assistant Professor (Affiliated) (Medicine), effective 9/01/2007.

Dean's Newsletter

December 17, 2007

Happy Holidays

It is always startling to consider that another year is about to end and a new one set to begin – with new opportunities and challenges, and more beginnings and endings. The milestones that take place in any single year are notable both personally and as a school of medicine. For example, during 2007 our medical and graduate students took further steps toward the completion of their MD and/or PhD degrees, our residents moved closer to board certification, clinical fellows advanced toward subspecialty training, our postdoctoral fellows refined and furthered their research efforts and career development, and our faculty and staff progressed through the hills and valleys of academic and clinical life and the life of our institution. Our medical school made major advances in supporting education and in making groundbreaking research discoveries and advances in patient care. And through all this, our personal lives evolved while the world around us continued to change – sometimes positively, but all too frequently with even greater challenges. As members of the Stanford community we endeavor to address important challenges –furthering our understanding of life and disease, improving health, educating leaders, addressing global and environmental issues and seeking justice and peace.

At this time of year our thoughts often turn inward as well as outward as we ponder the mysteries of the world we inhabit – our homes, families, friends and communities. I hope the upcoming Winter Break offers you some time for rest, reflection and renewal, and time for solitude as well as with loved ones. I hope it also offers an opportunity to reflect on the accomplishments of 2007 but even more importantly on the opportunities that lie ahead in 2008 and beyond. I wish you and your families the best for the holidays and for the year ahead.

A Memorial Tribute for Professor Arthur Kornberg will be Held on January 25th

As most of you know, Professor Arthur Kornberg, world- renowned biochemist and long time Stanford faculty member, died on October 26, 2007. A public Memorial Tribute to commemorate his extraordinary life and contributions to science and medicine at Stanford and beyond will be held on Friday, January 25, 2008 at 3 pm in the Dinkelspiel Auditorium (471 Lagunita Drive – near White Plaza). It will be followed by a reception at the Faculty Club (439 Lagunita Drive). All are welcome to attend.

Expressions of Support and Concerns from Students and Alumni

During the past week, I have been copied on a number of emails and comments from alumni and current students regarding their concern about a member of the teaching staff in relation to a new program called Educators 4 CARE. I am respectful of the deeply felt expressions of concern from each of our current and past students and colleagues with regard to Dr. Wolfe, and I appreciate the enthusiasm being expressed for further enhancing our clinical education. I have read and considered all the messages from alumni and students, and I attended and participated in a meeting led by concerned students on Friday, December 14th in the Dean's Courtyard.

While I appreciate the perspective and reactions of a number of students and alumni, I am also aware that the basis for some decisions (such as those involving the employment-related circumstances of individuals) cannot be discussed publicly and thus can leave uncertainty, confusion and distrust in their wake. That said, I would hope that those expressing their concerns would recognize that I and others in the leadership of the Medical School and University hear their messages and respect their right to express their thoughts and concerns. At the same time I would remind our colleagues that disagreements should be communicated in a professional and respectful manner and should avoid negative personal assertions or allegations that may, in fact, be misplaced or simply erroneous. Although it would not be appropriate to say more about Dr. Wolfe's particular situation, what I can tell you is that the University has decided to reactivate an independent dispute resolution process previously agreed to and utilized with him.

I would also hope that our community is mindful of the fact that the leadership of the School of Medicine and I have made medical education among our very highest priorities. Indeed, I hope it is more than evident that we have worked diligently to support and develop programs to improve our students' personal and professional lives, while easing the financial burdens that medical education can entail. Further, the faculty, senior education deans and Office of Educational Programs and Services staff have worked very hard to enhance the quality of our education programs across the basic and clinical sciences as well as to develop and generate the funding for the resources and facilities that are, and will be, available for them and future generations. By every measure -- including outside reviews by our National Advisory Council and the Liaison Committee on Medical Education -- medical education at Stanford is highly regarded, and the resources and services that have been put into place to support students are viewed as extraordinary and even nonpareil. It is also important to underscore that effective and successful medical and postgraduate education depends on the broad and deeply shared commitment of faculty and students -- an effort which transcends any one of us or any point in time.

Ending the Year Strong

A number of external and internal forces currently shape the financial wellbeing and underpinnings of academic medical centers, including Stanford. While all of the 125 medical schools and academic medical centers in the United States share common missions and sources of support, the balance among them is quite different and thus the

overall state of health of each medical school and medical center must be described individually. When doing so, it is important to recognize that a medical school/medical center is comprised of a number of individual components – basic and clinical departments, centers and institutes, faculty, students and staff – each with different financial profiles and resources. That said, the strength of an academic medical center resides in how well it is able to balance and integrate its missions and the resources used to support them. While it is expected that different components of a medical school – just like every other social network – will have different resources they can call on, how well one group is able to support another will translate into future sustenance and success.

Medical schools have several sources of financial support: sponsored grants and contracts, clinical income, support from endowment and reserves and gifts. Looking at these separately for Stanford School of Medicine, the following can be stated:

- I have commented frequently on the serious challenge facing the nation's biomedical research enterprise due to the flat and now declining NIH budget, which has had a significant impact on faculty at Stanford and across the nation (see: http://deansnewsletter.stanford.edu/archive/11_05_07.html#1). While our total sponsored research expenditures increased slightly in FY2007 (from \$266 million in FY06 to \$277 million in FY07), we are well aware that this could be the result of one or more large grants. We are well aware that our faculty are having to work harder to secure grants and also to support graduate students. Further, the indirect cost recover in FY07 is flat essentially compared to FY06 (at \$106 million).
- Clinical income has increased during the past year, reflecting increased performance by faculty as well as the recruitment of new clinical faculty. Further impacting these results is the positive impact of the new “funds flow” model, which is now in its second year. In the aggregate, clinical income for the departments and school increased from \$270.7 million in FY06 to \$300.3 million in FY07, resulting in a positive aggregate balance of \$46.1 million. Only one department had a clinical deficit, and it is expected that this will resolve in future years. Of interest, we still differ from virtually every other medical school in that our research income exceeds clinical income.
- We are fortunate at Stanford to have considerable endowment funds and reserve balances, which play critical roles in programmatic and capital funding. Even though many of these funds are restricted by use or by their local oversight (department, institute, center or school funds), in the aggregate they are important – especially in a time when external funding is constrained. As of August 31, 2007 the market value of the School of Medicine endowment was \$2.269 billion. It has risen commensurate with the Stanford endowment over the years as part of the “merged pool” that is overseen by the Stanford Management Company. While we do not have the figures for 2007, in FY06 the School of Medicine endowment was second only to Harvard Medical School in its size. That said, as I have noted in previous communications, endowments are highly restricted to specific

purposes – and a nearly a third of that which is allocated to the Dean’s Office is for education.

- In addition to endowment resources, the School also holds expendable fund balances or reserves, which fall into restricted and unrestricted components. These funds also increased from \$419.1 million in FY06 to \$458.1 million in FY07. Of these \$334.0 million reside in departmental accounts, \$25.5 in Institutes and the remaining \$113.2 million in central school accounts. Of note, within departments holding expendable reserves, faculty or divisions hold the majority of these. Moreover, a handful of departments hold the vast bulk of these dollars, where they are important for academic development. While it is not true today, it would be ideal if each department held sufficient reserves for emergency management and academic development.
- Patents and Royalties can also be a source of income for academic medical centers, although such revenues are unpredictable and not sustainable over time. That said, there are notable exceptions that have impacted medical centers like Stanford – including the Cohen-Boyer and Herzenberg patents.
- The final source of revenue is gifts from individual or foundations. I have reported in prior Newsletters (see: http://deansnewsletter.stanford.edu/archive/09_10_07.html#3 and http://deansnewsletter.stanford.edu/archive/09_24_07.html#8) that the School had an outstanding year in medical development. We have been fortunate to receive some significant gifts for buildings and facilities as well as for program development, including endowment. This is the result of efforts by many of our faculty as well as the Office of Medical Development. This is clearly an area for continued focus and effort – and one on which I spend a considerable amount of my own time.

Thus, looking at our consolidated budget and results, the School (as a whole) increased its bottom line by \$32 million in FY07. While the departmental reserves rose, the central School accounts declined because of significant investments in space, technology, recruitments (particularly in basic science departments) and various programmatic initiatives. These are all good things, of course, and it is terrific that we have been able to accomplish them. And while we are in a strong financial position compared to many peer institutions, we do have a number of challenges. Among these is the fact that the majority of our funds are restricted for specific purposes or are fully committed. In addition, while we have reserves, they are unevenly distributed, which creates, almost by definition, a “have and have not” portfolio. Obviously this is an issue deserving increased scrutiny. One way of addressing this is through transparency – which is why we shared the detailed financial data with the Executive Committee at its December 7th meeting, even though we acknowledged that it would raise questions and sensitivities. This commitment to transparency is also why I am sharing the some of the data with you in this communication.

We must also be cognizant of the many challenges that stand before us. The need to support faculty through difficult times in research funding, to cover the increasing costs associated with graduate student education, to recruit and retain outstanding faculty, to renovate and build new facilities, and to develop exciting new programs are just some of the challenges we face. While we won't be able to accomplish everything we want, we can continue to make progress on supporting key investments, albeit in a prioritized manner. And while the years ahead will be challenging, we face them with the recognition that we are strong in the key components for success: we have outstanding faculty, students and staff, and we have a strong financial platform from which to build the future.

Update on the Department of Neurology

At the Executive Committee meeting on Friday December 7th, Dr. Frank Longo, the George E and Lucy Becker Professor and Chair of the Department of Neurology, gave an update on the progress he and his colleagues have made in the past couple of years. His report follows – but I would quickly add how pleased and impressed I am by the efforts Dr. Longo is making on behalf of Neurology and the Neurological Sciences.

"The Department of Neurology and Neurological Sciences at Stanford is currently under a major development phase expanding its academic, clinical and teaching programs. The Department has a long history of training outstanding academic neurologists with some one dozen having served as department chairs of prominent programs across the country. With the continued growth of the Stanford campus, expansions of the Stanford and Packard Hospitals and the development of the Institutes of Medicine, the Department has an outstanding opportunity to further its development of high caliber programs. The key strategy in Department growth is the development of programs along a continuum from clinical to translational to basic science that integrate multiple disciplines across Stanford's Schools, Institutes and Departments. As part of this process, the Department has recruited ten new faculty members with a similar number of recruitments underway. Each faculty member and program is closely integrated with colleagues in other departments and schools.

- In ***Stroke and Neurocritical Care***, new programs have filled out a continuum extending from the creation of new patient services, such as the TIA Clinic, to expanded research. Areas include designing the next generation of imaging modalities that will allow more effective targeting of stroke treatments, creating better ways to predict and monitor the effects of brain cooling therapy in the intensive care unit and the launch of a new program developing stem cell and immune modulation approaches for stroke rehabilitation.
- In ***Epilepsy***, new basic science work has uncovered mechanisms underlying post-traumatic epilepsy, a major area of concern with troops returning from Iraq. Faculty are leading the nation's first two trials testing the ability of implanted devices to monitor electroencephalographic activity to predict an impending seizure and then deliver a targeted electrical pulse to prevent seizure onset. Research pioneering the linkage of advance imaging with electrophysiological

- monitoring will elucidate how seizures propagate in the brain. Expansion of epilepsy monitoring unit services will better accommodate patients needing advances therapies including neurosurgical approaches.
- The **Neuromuscular Division** has created a continuum of activity focused on motor neuron disease, that includes: patient care services for adults and children; the first implants of diaphragm pacers for ALS patients in the Western U.S.; a pioneering pharmacological approach in children with a genetic motor neuron disease to upregulate expression of a crucial gene and thereby slow neuronal degeneration; and finally, a preclinical trial in ALS mice of a novel small molecule targeted to a receptor regulating motor neuron survival.
 - The Department's **Alzheimer's and Dementia team** has pioneered the development of "resting state" functional MRI that can detect brain network differences between early Alzheimer patients and age-matched controls, thus nearing the long-sought goal of devising a brain imaging approach that can detect Alzheimer's onset. Other team members just last month published in *Nature Medicine* the development of a blood proteomic test that forged novel levels of accuracy in predicting which patients with mild cognitive impairment would go on to develop Alzheimer's. Novel small molecule approaches are being developed with one demonstrating an ability to correct memory deficits in Alzheimer's mice.
 - In **Movement Disorders**, cutting edge biomedical engineering and electrophysiological strategies have led to advances in understanding how deep brain stimulation might be made even more effective for Parkinson's disease patients and how a "retraining" approach might improve motor function in children with dystonia.
 - In **Multiple Sclerosis**, recruitment of an additional MS neurologist will allow further integration with our exceptionally strong MS and Immunology translational research programs.
 - The **Neuro-oncology group** has made considerable advances in elucidating stem cell mechanisms in brain tumors and how these might be harnessed for more effective tumor detection and treatment. Our Pediatric Brain Tumor team has developed one of the country's leading tumor treatment and assessment research programs.

The Neuroscience Development Team has played an essential role in enabling the Department to expand its programs. The donation of the Coyote Foundation Stroke Chair and many other recent gifts will continue to make possible pioneering academic and clinical programs.

More Stem Cell Awards

At its December 12th meeting, the Independent Citizens Oversight Committee (ICOC) of the California Institute for Regenerative Medicine (CIRM) announced the results of the recent competition for CIRM "New Faculty Awards." Each institution was able to submit four applications for this award. Of course, as a member of the ICOC, I recused myself from any review or discussion of the Stanford applicants. But we all share in the

wonderful news that all four Stanford faculty were selected for New Faculty Awards. In the aggregate this means an additional \$10.7 million to Stanford, with individual Awards, which are multiyear grants, ranging from \$2.3 to \$3 million each. The successful junior faculty include:

- **Anne Brunet, PhD**, Assistant Professor of Genetics was awarded \$2.3 million for work aimed at understanding what factors help maintain adult stem cells in the brain as an organism ages. Knowing what naturally keeps those stem cells healthy could lead to ways of preventing age-dependent decline in brain function and enable these cells to be used for therapeutic purposes in neurological or neurodegenerative diseases such as Alzheimer's and Parkinson's.
- **Howard Chang, MD, PhD**, Assistant Professor of Dermatology, received \$3 million to investigate the DNA changes that allow adult stem cells to remember what tissues they belong in. Finding these changes, which tell a cell that it belongs in the liver or brain, for example, could help scientists identify when embryonic stem cells have matured into adult cells.
- **Karl Deisseroth, MD, PhD**, Assistant Professor of Bioengineering and of Psychiatry and Behavioral Sciences, received \$3 million to develop rapid, inexpensive technologies for directing embryonic stem cells down a path to become cell types that can be used to treat diseases of the central nervous system, including stroke, Alzheimer's and Parkinson's.
- **Joanna Wysocka, PhD**, Assistant Professor of Chemical and Systems Biology and of Developmental Biology, received \$2.4 million to study changes to the proteins associated with DNA as embryonic stem cells mature into adult cells. This research will aid in future work in directing the stem cells down different developmental pathways.

This is wonderful news for each of these faculty members and for Stanford. I want to thank the faculty advisors and internal selection committee for their work as well. With these additional awards, Stanford has now received \$41,388,988 from the CIRM. The second highest funded institution by CIRM is UCSF at \$29,666,776 although they and three other institutions were unable to receive the New Faculty Awards because of an institutional conflict of interest – that will be hopefully resolved in the very near future.

Again, congratulations to Drs. Brunet, Chang, Deisseorth and Wysocka – well done!

Promising Provisional News on Major Facilities Grants from CIRM

On Friday December 14th Stanford received the news from the California Institute for Regenerative Medicine (CIRM) that it was one of 12 California institutions being recommended for the second round review for consideration for a “Major Facilities Grant.” As part of Proposition 71, CIRM has committed up to 10% of its resources for

facilities construction and renovation. According to CIRM, the objectives of the major facilities grants are:

- To fund new facilities – and encourage investments by others in new facilities – that are free of federal funding so as to allow research and development of therapies based on human embryonic stem cell and other stem cell researchers to proceed in California.
- To develop centers that will expand research capacity and capabilities in California while bringing stem cell-related researchers together in a collaborative setting.
- Fund new facilities and improvements where research institutions have determined that existing facilities are inadequate to advance important stem cell research initiatives.

The review process put forth by CIRM involves two stages or rounds. The first (the one Stanford has successfully completed) involved a review by CIRM's Scientific and Medical Research Funding Group, which is comprised of internationally recognized scientists outside of California along with patient advocates. At its January meeting, CIRM's Independent Citizen's Oversight Committee (ICOC) will recommend that the 12 successful round one applicants be approved to proceed to the round two review process. Because I am a member of the ICOC I will of course recuse myself from any decisions regarding Stanford.

Institutions were invited to apply for three types of stem cell facilities. Stanford applied for the highest-level designation, a so-called CIRM Institute, which could carry out research in three areas: basic and discovery stem cell science, preclinical (translational) research, and preclinical development and clinical research. Applicants could also apply to be a CIRM Center of Excellence, wherein they would do research in two of these three areas, or a CIRM Special Program, in which they would focus on one area. Potential major grants funding opportunities are correlated with the type of facilities. That is, CIRM Institutes could apply for funding ranging from \$25-50 million, whereas a CIRM Center of Excellence project could be between \$10-25 million and a CIRM Special Program between \$5-10 million.

It is important to underscore that the notice we have received to date is provisional and is pending approval by the ICOC and, more importantly, that it does not convey actual funding. That will follow the second round review, which will evaluate the technical aspects of the applicants' building program, including "how the scientific program aligns with the CIRM's objectives, and why the program represents a good value for California taxpayers investment." The facility for stem cell research at Stanford will be housed in the Stanford Institute of Medicine #1 building, which has just completed program level planning and which will be the basis for Stanford's submission to the second round review. It is anticipated that these reviews will be completed in April 2008.

Clearly this is excellent news for Stanford – but it is only the first of two important hurdles. Many individuals from Stanford's Institute for Stem Cell Research and

Regenerative Medicine worked diligently and collaboratively to prepare this submission, which was led by Mike Longaker and Irv Weissman. I know the University is grateful to them for their important efforts and contributions.

Immune Monitoring: Past, Present and Future

On December 13-14th the Stanford Institute on Immunity-Transplantation-Infection (ITI) hosted a symposium addressing the advances in immune monitoring, both those that occurred in the past and those that are shaping the future. Beginning with the development of the FACS (fluorescent activated cell sorter), along with the studies of the innate and acquired immune system and advances in genomics and infectious disease, Stanford has played a pioneering role in the complex interplay between genetics, immunity, host defense and the wide-ranging complications that ensue in immune system regulation. The ITI has been formed to bring clinical and basic scientists together to help unravel how the immune system interacts with the host and its endogenous and exogenous microflora – and how this relates to diseases that are either congenital or acquired. One of the immediate products of the ITI has been the development of the Immune Monitoring Center, which is now open for collaborative research projects (see: http://iti.stanford.edu/research/human_immune_monitoring.html). Given Stanford's enormous strengths in immunology, transplantation, infectious diseases, genomics, imaging and related disciplines, advances in this important area of translational research seem imminent – and Stanford has every reason to play an important leadership role.

Moves to SMP Completed

The relocation of the majority of School of Medicine administrative groups to Stanford Menlo Park (SMP) is now underway and will be completed this week. As you may recall from earlier newsletters, the driving force behind the decision to move these administrative groups is the need for academic programmatic space here at the Medical School. Because of General Use Permit and other restrictions we are virtually out of space for growth in our research and teaching programs.

Administrative groups moving include:

- Office of Facilities Planning and Management
- Office of Institutional Planning
- SPCTRM
- Communication and Public Affairs
- Information Resources Technology - IT Infrastructure Services Group (Networking, Data Center and Service Desk), IT Security and Privacy, Web and Systems Engineering, Finance and Administration. Not moving are the Office of the Senior Associate Dean for IRT, Lane Library, Educational Technology Services, The Center for Clinical Informatics, the Center for Immersive and Simulation-Based Learning (CISL) and SUMMIT.
- Human Resources Group (except for Employee Relations staff and the Director of Organizational Effectiveness. These individuals will remain in MSOB.)

- Research Management Group
- Finance (Controllers Group, Faculty Compensation Group, and Budget and Planning Group)

I would like to extend my thanks and admiration to the individuals moving to the new location. They have shown a pioneering spirit and a generous attitude towards the practical adjustments needed to effectively conduct their work from a remote site. In addition, they are trendsetters; the University administrative groups moving to Porter Drive this summer to make room for the new GSB campus will be facing similar challenges and will be able to build on our experiences. Finally, this move also serves as a laboratory for future relocations, including the eventual one to Redwood City slated for 2012.

I would also like to thank the Offsite Steering Committee, led by Julia Tussing in the Dean's Office and comprising directors and administrators from the groups moving (Cori Bossenberry, Todd Ferris, Linda Gibson, Connie Hartnett, Susan Hoerger, Dave O'Brien, Lora Pertle, Rebecca Trumbull, Carol Velazquez, and Sam Zelch) as well as representatives from academic departments (Martha Kessler and Brian David), with Frank Topper facilitating.

A number of initiatives to ensure that business continues efficiently have been implemented. Touchdown space in which SMP staff can work while on campus is being configured on the ground floor of the Alway building, and analogous space is being arranged at the Menlo Park campus for visitors from the School of Medicine site. In order to keep peak hour traffic down and allow easy access to campus, a shuttle service provides fast transportation between SOM and Stanford Menlo Park; a bike fleet is also available, and we have preserved access to Commute Club membership.

Please do your best to be supportive of these groups during this transitional period, and to applaud their efforts in making this work well for everyone. Details about the move, transportation, and the location can be accessed on the [SMP website](#).

Awards and Honors

Dr. Pak H Chan was officially installed as the first **James R. Doty Professor in Neurosurgery and Neurosciences** on Monday evening, December 3rd. This new professorship resulted from a \$5.4 million gift that Dr. Doty, a former faculty member in Neurosurgery, made to the department – the largest single gift ever made to the Department of Neurosurgery. The gift is specifically dedicated to the support of basic science research, which makes Pak Chan an outstanding first incumbent holder of the James R. Doty Professorship. Dr. Chan, who joined Stanford in 1977, has made outstanding contributions to the understanding of neuronal injury and death that serve as critical underpinnings for helping to understand the damage caused by stroke and the prospects for treating or preventing CNS injury. Congratulations to Dr. Chan and thanks to Dr. Doty.

Dr. Jonathan Berek, Professor and Chair of the department of Obstetrics and Gynecology, is unlikely to see his picture on the cover of *Time* magazine. But he has the distinction of being nominated for the 2007 Time Person of the Year by actress Nicole Kidman. Among the other nominees are the Dalai Lama and Al Gore. Quite a notable crowd for our respected colleague!

Dr. John Morton, Associate Professor of Surgery has been named SAGES Young Investigator of the Year 2008. This prestigious award from the world's largest minimal access surgery society (Society of American Gastrointestinal and Endoscopic Surgeons) is for demonstrated excellence in endoscopic surgical research for a SAGES member who has completed training within the past five years.

Appointments and Promotions

- **Christopher D. Gardner** has been promoted as Associate Professor (Research) of Medicine (Stanford Prevention Research Center), effective 12/01/2007.

Dean's Newsletter January 14, 2008

Memorial Celebration of Dr. Arthur Kornberg

On Friday January 25th the School of Medicine will host a memorial celebration to honor the life and remarkable contributions of Arthur Kornberg who died on October 26, 2007. The Celebration will begin at 3 pm in the Dinkelspiel Auditorium and will be followed by a Reception at the Faculty Club. All are invited to attend.

Some Challenges for 2008

As the New Year begins we can look forward to the continuation of many wonderful accomplishments and successes by our faculty, students and staff. But to foster and enrich opportunities for the future, it is important that we be cognizant of looming challenges that arise from both internal and external forces and events. Some of these are controllable, whereas others present obstacles that may be more difficult or even impossible to surmount. When I was planning my arrival as Dean in January 2001, I felt strongly that the best way to respond to change was to take charge of it and plan accordingly. That view led to the development of our initial strategic plan, entitled "*Translating Discoveries*," and has accounted for many of our advances in our integrated missions of education, research and patient care during the past nearly seven years. Integrated planning has also guided our approaches to long-term facility and finance

planning, the development of our professoriate, the role of information technology and related resources, our approach to communications and public affairs and our efforts in fundraising and medical development.

We have continuously renewed and revised our institutional strategic planning efforts and have revisited them in the aggregate each January at our Annual Strategic Planning Retreat. The theme for this year's retreat is "*Quality and Balance*," which we will explore across the dimensions and domain of the medical school, medical center and university. We are a small research-intensive school of medicine aligned with two major teaching hospitals and co-located on the campus of an outstanding university. In this context it is imperative that we establish choices and priorities that optimize our uniqueness and permit our greatest future success despite constraints, limitations or challenges which inevitably arise – whether they emerge from within Stanford or from forces and events that occur locally, regionally, nationally or globally.

For example, a continuing challenge for us is sustaining and enhancing quality in a medical school that, compared to its peers, is comparatively small in size and constrained in space. In addition, we, like other academic centers, face reductions in research funding and a national climate that has increasingly tended to pit religion against science in the political arena. I have highlighted and discussed many of these issues in prior Newsletters and will more briefly highlight here some of the concerns that are high on my list for the next year. In doing so I am fully cognizant that they might easily be superseded by unanticipated events or by ones that are now viewed as less immediate. But I also believe that unless we anticipate issues and plan around them we run the risk of being reactive rather than proactive, letting events shape us rather than our shaping our institution and its future. The listing below is not prioritized and is hardly complete. But it does present a reasoned sampling of issues.

Challenges arising within Stanford

- ***Size and focus of student and education programs.*** During the past several years we have made considerable strides in better defining the guiding principles of medical education at Stanford. Our New Stanford Curriculum, initiated in the autumn of 2003, is one major result of these efforts. The new curriculum, which focuses on training physician scholars, scientists and leaders, has quite naturally impacted the students seeking education at Stanford as well as the types of students we select. While there is a purposeful direction to our medical education programs, it is also important that they remain balanced and that we weigh equally excellence in clinical education and professionalism, on the one hand, with scientific reasoning and proficiency, on the other. We still have work to do in achieving this balance, especially on the side of the equation dealing with clinical training. New programs such as Educators-4-Care are being designed to improve clinical teaching and mentoring for medical students.

As I have also noted in prior communications, assessing the impact of our new curriculum on the gender and ethnic balance of our student body is important.

These concerns have influenced our discussion about emphasizing a Flexible Five-Year Program and will also impact our discussion about increasing the size of the medical school class from 86 admitted per year to perhaps 100 students per year.

We remain fortunate in attracting incredibly talented PhD graduate students, and we want to sustain the excellence of the bioscience programs at Stanford, which encompass the Schools of Medicine, Humanities & Sciences, and Engineering. The major challenge we face is the financial support of graduate education, especially given the limitations that the NIH has placed on tuition costs paid from grants. These, when coupled with the cost of tuition at Stanford, present an increasing burden and challenge to our basic science faculty. We have been working to address this issue by examining novel ways of using our restricted education endowment to cover graduate students as well as other key programs such as the Masters in Medical Science and the Advanced Residency Training at Stanford. It appears that we may be able to develop some options that have been unavailable heretofore, and this should provide some relief. We will be working on the details of how this can be accomplished in the coming months.

Continuing to support an environment that fosters the Stanford experience for our postdoctoral scholars remains an important challenge. As I have previously commented, postdoctoral scholars are among the most important individuals in our program and yet they seem to get less attention – and likely feel less respect – than other colleagues. While we have made some strides and are benefited by excellent leaders and a committed Office for Postdoctoral Affairs, much work remains to be done.

- ***Size, scope and satisfaction of the faculty.*** I have commented frequently that our full-time faculty is small compared to peer institutions (less than 40% the size of UCSF and less than 10% the size of Harvard). There are benefits from being relatively small. For example, our size forces us to choose faculty with greater care than at larger institutions and to emphasize quality and excellence. And we benefit from having to prioritize our areas of focus and effort. These choices and priorities can be more easily made for basic science programs than for the clinical programs. There we face an ever-increasing challenge, since the complexity of patient care makes it imperative to have both depth and breadth of services and expertise.

As I see it, we have several major issues on the horizon. The first is that we will be running up against the faculty billet cap of 900 during the next 1-2 years. We have now crossed the 800 threshold of full-time faculty in the Investigator (University Tenure Line [UTL]), Clinician Scholars/Scientist (Medical Center Line [MCL]) and non-tenure (research and education) lines. Given the recruitment of new departmental leaders in recent years, the pace of clinical programmatic development is accelerating – which is a good thing –

but this will also mean that the timing for breaking through the cap is at least a year ahead of prior projections. We have been engaged in broad institutional planning across the medical center during the past several years and have been attempting to project the number of full-time faculty we will need during the next decade to fulfill our missions in basic and clinical research as well as education and patient care.

To date, thoughtful planning exercises project an ultimate faculty size between 1030 and 1060. This does not include our Clinician Educators, who are enormously important to our missions but who do not count against the billet cap. We understand that the billet cap and the size of the medical school faculty represent an important issue for a university that prides itself on excellence across each of its schools and that places a premium on quality over size. We certainly respect that point of view, but we face the challenge that delivering outstanding clinical care requires greater programmatic depth and breadth. Clinical programs, unlike other academic ones, are interdependent, making it impossible to cut out services to adjust to a fixed program size. That said, I am well aware that the faculty size and billet caps will be an increasing issue for the medical school in the coming year(s).

In tandem with faculty size we also need to better address the unfortunate perception that Clinician-Educators are not as valued as other members of the medical school professoriate. I view Clinician Educators as essential to our future success in patient care. Notably, many of these physicians are also highly valued by our students as outstanding educators in clinical medicine. We need to do more to break down barriers of perception and bias. This will require the leadership and engagement of our clinical chairs and division heads, and I am counting on their efforts and commitment.

In many ways the overall satisfaction of our faculty is tied to the work-life balance issues they face on a personal level. Surveys and assessments we have carried out continue to demonstrate that clinical faculty experience greater stress than their basic science peers – and that women feel this stress more acutely than men. While we have put programs in place to help ameliorate some of these challenges it is clear that more efforts and creativity are needed. We need to do more to foster career development of women and underrepresented minorities so that they, like all our faculty, may fully achieve their goals and aspirations.

An additional challenge is assuring that we sustain a meaningful balance between our missions in basic and clinical research. There is no doubt in my mind that we are distinguished as a school of medicine because of the contributions and excellence of our basic science faculty. As we assess faculty size it is imperative to also achieve balanced growth in basic science as well. This is important for many reasons – not the least of which is sustaining our pre-eminence as a research-intensive school. Ironically, despite their

excellence, survey data indicates that members of our basic science community feel undervalued and overlooked. I am sure this feeling is not helped by the serious challenges many investigators are now facing in securing competitive grant support from the NIH. But it also may reflect the fact that their voices may appear to be less heard in institutional decision making or that they may not be listed among the priorities for programmatic or philanthropic support. I am committed to doing my best to change these perceptions – and the realities of support – but there is little question that these feelings impact the morale and wellbeing of our community. This represents yet another challenge we must address in the coming year.

- ***Quality and Balance across our missions.*** These days when “quality” is mentioned in medicine it is generally associated with patient care and clinical service activities. But clearly “quality and balance” extend across our missions and require continued emphasis to assure that we achieving the highest levels of success in our programs in education and research as well as patient care. Defining metrics for quality is a challenge for even local use and becomes more complicated when standards are applied across institutions. In the current era, however, quality metrics are increasingly becoming an expectation and are being used to publicly rate hospitals as well as physicians – whether it be scores by the University Health Consortium (UHC) or Leapfrog or the recently announced “Zagat- like” guide for doctors (see January 12, 2008 New York Times *“Rating of Doctors Now a Business Unto Itself.”*)

Achieving quality requires more team-based collaboration, and it requires independent minded physicians to adopt a different approach to medicine. I recently wrote about this in the December 2007/January 2008 issue of Compass, a publication about Quality and Patient Safety at Stanford Hospital & Clinics (I published this in the November 5th issue of the Dean’s Newsletter. And if you haven’t read it, I would strongly recommend that you review the article by Dr. Atul Gawande entitled “The Checklist” that was published in the December 10th issue of The New Yorker.

We have clearly crossed a threshold in public access, awareness and perception about the quality of medical care. Whether rightly or wrongly, regional and national metrics will be used to guide payments to hospitals and doctors and will impact the referral of patients to providers and institutions. While one doesn’t want to simply play to the polls (like our colleagues in politics) it is imperative that we be aware of the metrics being used and responsive to their assessment and that we take a leadership role in helping to define the most accurate metrics possible for future use. Of course, our ability to be change agents will be influenced by how well we are seen as leaders in this important area. While I am pleased that the close collaboration of SHC, LPCH and the School of Medicine has resulted in significant progress in our national rankings on quality metrics, we have much more work to do in this

area. And without doubt it will remain a continuing challenge that requires constant vigilance and effort for the future. This will certainly be an area of major discussion at our upcoming Leadership Retreat at the end of January.

- ***Integration of programs within the medical center.*** While the School of Medicine, SHC and LPCH are separate entities, we are closely joined in our missions and the success of one is closely dependent on the success of others. It is safe to say that at many academic medical centers there are constant strains and struggles between the medical school and teaching hospitals and between faculty and administrators. Of course such strains and challenges exist at Stanford but I must quickly add that we have all worked hard to overcome them and to engage, as much as possible, in integrated planning and collaboration. There are inherent differences between an academic enterprise like a medical school and a business such as a hospital. But the interconnections are highly significant and must be unifying wherever possible. Accordingly, we have engaged quite thoughtfully in integrated financial, programmatic and facilities planning activities.

For example, we have worked collaboratively to define the projected size of the clinical faculty and how that will impact on the projected bed size capacity of both SHC and LPCH. We have also worked collaboratively to determine which clinical programs should remain on the current medical center footprint and which would be more optimally developed at the new SHC Redwood City North Campus site. Additionally, we are working collaboratively to develop a shared website between the School and SHC that will serve our broad Stanford Medicine community. We are working collaboratively as well on the implementation of the electronic medical record systems at SHC (i.e., EPIC) and LPCH (i.e. Cerna) – and their implication for faculty performance. We are working collaboratively on improving efficiency, throughput and service.

That said, there will be important challenges as the issue of balance between hospital investments in program versus those in capital becomes more evident during the coming years. The needs involved in priority setting are nearly always multi-faceted, and there seems little doubt that tensions will surely arise as resources become more constrained. This will require transparency, communication, trust and leadership. But I do think that the next several years, especially during the period of hospital and school facilities developments and growth, will test our boundaries and fortitude. Many of the issues and their dividing lines are already evident but their solutions will be challenges.

- ***Coordination of programs across the university.*** One of the areas I am most pleased with is the better integration of the medical school with the rest of the university that has occurred over the past several years. The period during the Stanford-UCSF merger and de-merger created considerable distraction, and the financial debacle that ensued created major tensions and misperceptions

on both sides of Campus Drive. Thankfully, we have been successful in bridging a number of these gaps, and the medical school has increasingly close relationships and interactions with each of the other six schools that comprise Stanford University. These are of enormous value and importance since one of the medical school's greatest strengths is the interaction of faculty and students in research and education in various interdisciplinary efforts.

The well-established Bio-X, Bioengineering, the Bioscience Programs as well as the evolving interactions with the Schools of Business, Law and Education are all notable and important. At the same time, sustaining and enhancing these interactions require shared efforts and cooperation. Thankfully the current leadership provided by the President, Provost and various Deans has helped considerably. But I would predict that tensions will arise as the need for medical school faculty growth becomes more evident, or as the needs of the hospitals for additional resources come to the fore, or as the competition for fundraising reaches greater heights. There is no denying that these tensions are natural and predictable. But their management will be an important challenge during this year and those that follow.

- ***Facilities.*** One of our greatest challenges for the next several years is the availability of space for academic programs and patient care. The medical school and the hospitals have spent considerable time and effort in the development of master facilities plans for each entity that will unfold during the next 10-15 years. The scope of these projects is enormous and represents the largest building effort ever undertaken at Stanford. The renewal and expansion of hospital facilities at SHC and LPCH will add approximately 1.3 million gasf (gross available square feet) in Palo Alto, with additional clinical sites being developed in Redwood City, Sherman Avenue (Palo Alto) and elsewhere. During this same time period the medical school will add approximately 982,000 gasf at onsite and off-site locations.

As you might imagine, the costs of these new facilities are enumerated in multi-billion dollar projections that will require judicious financial planning, coordination and fundraising. While we have determined the optimal size of the hospitals and the projected needs of space for wet and dry research, we have work to do in determining the size and location of space for clinical faculty. Needless to say, the staging of the facilities projects will require considerable flexibility – but there will be a time when choices will become more limited and we will be locked into decisions. That makes it all the more important to test and retest our assumptions about the major drivers for these projects, whether that be the projected needs of faculty or the capacity requirements of the hospitals. We are currently reviewing these issues (among others) for the third time. While doing so, we also recognize that the pace of the growth and development will ultimately need to be adjusted according to what is affordable and doable.

For the medical school, we anticipate the initiation of two major projects during this next year. The first is the groundbreaking for the Learning and Knowledge Center (LKC1), which is currently slated for late winter of 2008. The second is the groundbreaking of SIM1 (Stanford Institutes of Medicine 1) now slated for late 2008 or early 2009. The timing of these projects will be influenced by the completion of our fundraising goals and the final financial plans for construction. As we continue with the next stages of the LKC and SIM1 we are also engaged in the programmatic planning for FIM1 (Foundations of Medicine 1) and are beginning to stage our plans for the Freidenrich Center for Translational Medicine (to be located at 800 Welch Road) as well as planning for LKC2 and SIM2. In addition to these on-site projects we are also engaged in plans for offsite facilities as well. So, these efforts are quite broad and will require us to balance a number of converging (and some diverging) goals and objectives.

- ***Financial resources.*** In the December 17th Dean's Newsletter, I highlighted our financial performance for the past fiscal year and stated then that "we must also be cognizant of the many challenges that stand before us. The need to support faculty through difficult times in research funding, to cover the increasing costs associated with graduate student education, to recruit and retain outstanding faculty, to renovate and build new facilities, and to develop exciting new programs are just some of the challenges we face. While we won't be able to accomplish everything we want, we can continue to make progress on supporting key investments, albeit in a prioritized manner. And while the years ahead will be challenging, we face them with the recognition that we are strong in the key components for success: we have outstanding faculty, students and staff, and we have a strong financial platform from which to build the future."

For the medical school and the hospitals, it will be important to ascertain the balance between programmatic and capital investments needed to optimize our future. But as I also noted in the December 17th Newsletter "looking at our consolidated budget and results, the School (as a whole) increased its bottom line by \$32 million in FY07. While the departmental reserves rose, the central School accounts declined because of significant investments in space, technology, recruitments (particularly in basic science departments) and various programmatic initiatives. These are all good things, of course, and it is terrific that we have been able to accomplish them. And while we are in a strong financial position compared to many peer institutions, we do have a number of challenges. Among these is the fact that the majority of our funds are restricted for specific purposes or are fully committed. In addition, while we have reserves, they are unevenly distributed, which creates, almost by definition, a 'have and have not' portfolio. Obviously this is an issue deserving increased scrutiny. One way of addressing this is through transparency -- which is why we shared the detailed financial data with the

Executive Committee at its December 7th meeting, even though we acknowledged that it would raise questions and sensitivities.”

Understandably these will be difficult challenges to address, and doing so will undoubtedly pit the needs of individuals, departments and schools against one other from time to time. But our collective success is interdependent and we will need to proceed with that in mind. This becomes more apparent as we look to our multi-year financial planning and projections that will guide the rate and nature of our investments – and help to define their sources as well.

- ***Medical development.*** The past fiscal year was a record for the medical school with \$246 million raised in pledges and gifts (see: <http://news-service.stanford.edu/news/2007/november14/med-fundraiser-111407.html>). This is a great testament to the wonderful individuals and foundations that resonated to Stanford proposals and plans and stepped forward to help support our dreams and goals. It is also a testimony to the dedicated work of our faculty and the members of the Office of Medical Development. And while this is a great success, the challenge will be doing as well or better in the current fiscal year and those that will follow. As noted elsewhere in this communication, our programmatic and capital needs are considerable and our resources are limited. Continuing to identify individual donors who have the capacity and commitment to make major gifts will be a continuing challenge – and one that will be heightened by the concurrent needs and aspirations of our hospital partners as well as our university colleagues. While we – and I – are putting considerable resources and time into medical development and fundraising, this will surely be a continuing challenge in 2008 and beyond.

Challenges coming from our local, regional, national and global communities

- ***Entitlements and GUP.*** I discussed the medical center expansion project and especially the ongoing entitlement negotiations with the City of Palo Alto in my December 5th Newsletter. During 2008 the entitlement review as well as the architectural review will be conducted by the City Council. While one would naturally think that a city would be proud to have a world class medical center in its backyard, the views of at least some of the members of the City Council are remarkably narrow-minded in their reluctance to see the benefits that come to the community from the medical center. Thankfully this view does not seem to be shared by the public, who generally favor and support the hospitals and their needed expansion and renewal. That said, this next year will pose many challenges about these projects from the City of Palo Alto.

It is not generally appreciated that the medical center is bifurcated between two jurisdictions – the City of Palo Alto and County of Santa Clara. While decisions regarding the hospitals and the current Grant, Alway, Lane and Edwards Buildings reside in Palo Alto and are governed by the City Council, as noted above, other medical school projects (e.g., LKC1, SIM1) are governed by the rules of the County’s General Use Permit (GUP), which

delineates the amount of space that can be allocated to these or future projects. One of our challenges is that, when summed across the entire university, we are approaching the limitation of available GUP space. This means that future buildings in the County (e.g., SIM2) will require a further allocation of space. This too will be a challenge.

- ***The political climate in California.*** We are fortunate that California is a progressive State regarding science and medicine. The fact that in November 2004 the citizens of our state passed Proposition 74, which established the California Institute for Regenerative Medicine (CIRM), has helped us to become a leader in embryonic stem cell research. Stanford has been highly successful in competing for grants and awards from CIRM, and a number of important opportunities and challenges will unfold during the next year – including for major facilities as well as individual and team based awards.

While the funding for stem cell research has been exceptional in California, the investment of the State in Medicaid (aka MediCal) is among the lowest in the nation and has impacted significantly on the care for children and the financial stability of children's hospitals – including LPCH. With the recent announcement of budget cuts by the Governor and the uncertainty of healthcare reform, it is likely that 2008 will bring additional strains to the medical care system. Of course, much of this is a national problem, but the impact of entitlement programs, particularly MediCal, is particularly challenging in California and represents an ongoing challenge.

- ***Academic-Industry relationships.*** I have communicated frequently about the continuing challenge of academic-industry relations (see: http://deansnewsletter.stanford.edu/archive/11_19_07.html#b) - another topic we will also be discussing at the upcoming Leadership Retreat. While we have taken a number of leadership positions on these issues, it is not unlikely that national attention will cause us to focus on this more deeply as Congressional investigations proceed. I am also expecting to learn the results of the School Task Force that we established in 2007 to evaluate industry support for Continuing Medical Education here at Stanford– which I am certain will evoke some debate and discussion. While we clearly want to foster interactions with industry to bring discoveries to development, we also want to do all we can to assure that doctors and scientists avoid becoming marketing agents for industry or develop conflicts of interest that would threaten their integrity as individuals or as members of the Stanford community. Clearly this issue will be a continuing challenge for 2008 and beyond.
- ***National agendas and politics.*** Numerous issues are converging on medicine and science at the national level. The sometimes rancorous and often unfortunate debate on the boundaries between science and religion has created a number of fracture lines around topics like evolution and creationism, stem

cell research and abortion, among others. In addition, the support for science has become problematic to say the least. The final 2008 budget for the NIH (\$29,456 billion) increased by only 1.1% from FY07 – resulting in the fifth year that the NIH budget increase has been below inflation. This problem is now worsened by the increasingly challenging economic situation and is not helped by the general loss of broad congressional support for the NIH. While major efforts by a coalition of academic and industry leaders resulted in an increase of 4.4% research funding for the NSF, the overall portrait for sponsored research in the biomedical sciences is extremely worrisome. Reversing these trends will require continued efforts by coalitions of academic leaders, professional and disease based societies, advocates and industry. But even that may not overcome the limitations of discretionary funding that has been made so much worse by the policies emanating from Washington during the past several years.

The New Year has of course heightened all of our awareness of the march toward the United States' presidency. It is incumbent that we learn as much as possible about the views of Democratic and Republican Party candidates about science and medicine. The January 4th issue of Science presents the views of nine of the candidates, including those who have emerged as leaders following the Iowa caucus and the New Hampshire primaries. You can review the viewpoints of these candidates at <http://www.sciencemag.org/content/vol319/issue5859/index.dtl#n-focus>.

In addition to understanding the position of candidates on science, it is equally important to understand where they stand on healthcare reform. To date the Republican candidates have been relatively silent on their views and while the Democratic candidates have offered more robust perspectives, none are bold or far-reaching. A reasonable comparison of these positions is described by Jonathan Oberlander in "[Presidential Politics and the Resurgence of Health Care Reform](#)" N Engl J Med 2007; 357: 2101-2014.

There is little question that policies regarding science and health care reform will impact our nation and academic medical centers, including Stanford. Thus anticipating some of these changes – and ideally influencing them – is important for our future.

- ***Thinking globally.*** While whatever happens on the national front has an impact, global changes in everything from climate to economics, including of course poverty and war, and disease and social justice, have an increasing impact on who we are as individuals, communities and nations. Through the Stanford Challenge, the university has decided to become more proactive in international issues and challenges, including global health. This year we are recruiting a leader who will work across the university to help lead this initiative and shape our future efforts. Given the increasing interest of our students, trainees and faculty in global issues, one of our important challenges

is to further nucleate our efforts by identifying an internationally recognized leader. That search is now commencing and, I hope, will have a positive outcome in 2008.

Of course this is just a sampling of some of the issues and challenges I envision for 2008 and beyond. As I stated above, I am certain that others will arise as well and of course there are numerous topics I am already aware of that I haven't listed. That does not mean they are unimportant or that we won't address them. I simply wanted to highlight some that I felt would be of general interest. We will do our best to help address them – and I am counting on your support as well. Happy New Year!

Leadership Changes in the Clinical Laboratory

Dr. Steve Galli, Chair of the Department of Pathology and the Mary Hewitt Loveless Professor, along with Mike Peterson, Chief Operating Officer at Stanford Hospital & Clinics (SHC) and Sue Flanagan, Chief Operating Officer at the Lucile Packard Children's Hospital (LPCH), asked that I provide you this update on leadership changes in the SHC Clinical Laboratory. The SHC Clinical Laboratory serves patients and physicians at SHC and LPCH as well as those who utilize the laboratory's outreach testing program. One of the leadership changes involves Dr. Richard Sibley, Professor of Pathology, who served as the Medical Director during the past four- and-a-half years and who has decided to step down from this position.

Dr. Sibley assumed the role of Medical Director at a time when the Clinical Laboratories were undergoing significant changes, both in terms of an expansion of the Outreach Program and the relocation of many of the laboratory services from the main hospital to an offsite location on Hillview Avenue in Palo Alto. On behalf of the Department of Pathology, School of Medicine, SHC and LPCH, and all those who work in and are served by the SHC Clinical Laboratory, we thank Dr. Sibley for his dedicated leadership and significant accomplishments during his time as Medical Director. He played an extremely important service and will now redirect his efforts to his work in surgical pathology, pathology trainee and medical student education, and research.

Dr. Daniel Arber, the current Director of the SHC Hematology Laboratories, has been named as the interim Medical Director of the SHC Clinical Laboratories. Dr. Arber will be working closely with Dr. Richard Sibley during this transition period, and will serve in the role of interim Medical Director until the appointment of the next Medical Director of the SHC Clinical Laboratories. A national search is currently underway to identify the permanent director. Dr. Arber will also continue in his role as Director of the SHC Hematology Laboratories.

On behalf of the School of Medicine, SHC and LPCH, we thank Dr. Arber for generously agreeing to serve as interim Medical Director of the SHC Clinical Laboratories. We also thank Dr. Sharon Geaghan, Co-Medical Director of the SHC Clinical Laboratory for Pediatrics and Dr. Daniel Barrio, Administrative Director of the SHC Clinical

Laboratory, for their continued service and leadership as part of the Laboratory Executive Group.

Science and Medical Education for High School Students

At the December 21st Executive Committee meeting, Dr. P.J. Utz, Associate Professor of Medicine, gave a presentation on some of the exciting high school outreach programs in the School of Medicine. Three programs in the School of Medicine recently won support from the Howard Hughes Medical Institute (HHMI): the Stanford Medical Youth Sciences Program (SMYSP) which is now in its 20th year of successful operation and which was founded and is directed by Dr. Marilyn Winkleby, Professor of Medicine; Stanford at the Tech, directed by Dr. Barry Starr, Department of Genetics; and the Center for Clinical Immunology at Stanford (CCIS), founded and directed by Dr. Utz (see http://ccis.stanford.edu/intern_program.html). In addition, the School of Medicine also provides a summer program for disadvantaged college students who are interested in careers in science and medicine.

Dr. Utz focused his presentation on the program which he initiated in the summer of 2000 with 10 students; by 2007 it had grown to 22 students each year for high school students interested in careers in science and medicine. It has become a well - established program that includes, in addition to laboratory research, a summer lecture program with a remarkably detailed syllabus. The program also provides teaching opportunities for graduate students and postdoctoral fellows, who serve as Teaching Assistants (TAs}. At the conclusion of the program, a poster session is held at which all students present data generated in their research. The quality of the students accepted into the program is exceedingly high and has included three valedictorians and 10 who are #1 in their high school classes.

Based on the success of the immunology program, Dr. Utz and his colleagues are beginning to replicate it in the other Stanford Institutes of Medicine. Plans call for the establishment of an overall structure across all the institutes that would include an administrative core and separate education and research programs within each institute. The goals for this broader set of programs include: interesting students in careers in biomedical science and in interdisciplinary research; improving the teaching of graduate students and postdoctoral fellows; and encouraging interactions between faculty. The Executive Committee was enthusiastic about these goals and appreciative of the efforts of Dr. Utz and his colleagues to establish these programs and make them successful. I am particularly grateful for Dr. Utz' inspirational leadership and his dedication and commitment in inspiring high school students to contemplate careers in science and medicine.

Update on the Department of Otolaryngology – Head & Neck Surgery

At the January 4th Executive Committee Dr. Rob Jackler, Edward C and Amy H Sewall Professor, gave an update on the progress he has made since becoming Chair of the Department of Otolaryngology – Head & Neck Surgery (OHNS) that was established just

over four years ago. Since then the department has grown to become a premier program with strengths in clinical specialties, education and research.

As noted by Dr. Jackler, OHNS has grown from 6 to 20 faculty members during the past 4 years (and is on the way to being 24 faculty over the next 2-3 years). These include six new clinical division chiefs: Dr Peter Koltai (Pediatric OHNS), Dr Michael Kaplan (Head & Neck Oncology), Dr Peter Hwang (Rhinology and Sinus Surgery), Dr Sam Most (Facial Plastic Surgery), Dr Edward Damrose (Laryngology), and Dr Gerald Popelka (Audiology & Hearing Devices). The department is in the midst of recruiting a cadre of young surgeon – investigators charged with the purpose of building strong ties between the clinical world and our basic science and engineering communities.

During this time the OHNS residency has grown from 3 to 4 residents per year for a total of 20 residents over the five years of training. The department now offers seven post residency fellowship/clinical instructorship programs, more than virtually any OHNS program, including: facial plastic surgery, head & neck surgery, pediatric OHNS, neurotology & skull base surgery, sinus surgery, sleep surgery, and laryngology. These programs not only provide advanced training for promising young academicians, but because most of the trainees are also junior faculty members, they enhance the residency educational experience as well.

The research programs in OHNS have also been highly successful. The priority of the department's laboratory programs is to produce high quality, innovative research in areas of inquiry relevant to human disease. Two central themes are being developed: Regenerative medicine and Bioengineering. Under the leadership of research director Dr Stefan Heller a team of investigators has been assembled to explore the prospect of overcoming deafness through use of stem cells to regenerate the organ of Corti. In collaboration with Drs. Irv Weissman and Mike Clarke, efforts are also underway to identify stem cells in squamous cell carcinoma of the head & neck. In the area of bioengineering-related research efforts are underway to integration of the human ear and voice with digital devices, study mechanics of sound transmission through the tympano-ossicular systems, and development of surgical simulation models using 3D – haptic enhanced simulators, microendoscopy of the inner ear, and high speed laryngeal imaging.

Stanford OHNS has come a long way in becoming an independent department just four years ago. Among the major accomplishments are the tripling of the faculty with recruitment of a number of highly talented individuals; abandoning long antiquated facilities for new ones triple their size; sizable expansion of both residency and fellowship programs; and development of dynamic, cutting edge research programs. It is important to note that Dr. Tom Krummel was instrumental in the future success of OHNS through his willingness to have the division of Otolaryngology, previously part of the department of Surgery, become an independent department. This was an act of institutional generosity that deserves our appreciation.

Of course I also want to commend Dr. Rob Jackler for his visionary leadership. He has forged significant and meaningful collaborations with colleagues in basic and clinical

science and has worked diligently with his colleagues – both those who were part of the original division as well as those who have been recruited to the department – to lead and develop a terrific clinical department.

Announcements from the Office of Programs and Services

I am pleased to relay these announcements, which I received from Jim Rollins, Director of Finance and Administration for the Office of Programs and Services.

First, John Bray has been named Assistant Dean for Graduate Education, Director of Biosciences Admissions and Administration. Since his arrival in December 2002, John has served in various roles within the School of Medicine's Office of Graduate Education. Over the past three years, he has led and significantly improved the Biosciences graduate-student admissions process while also managing the efforts of several other staff members in the organization. Congratulations to John.

Second, Elizabeth Porter, Assistant Dean for Medical Education, has left Stanford after 18 years of dedicated service to medical education in the School of Medicine to embark on exciting new ventures, seeking new challenges and opportunities in her personal and professional life. No words can convey the tremendous impact Elizabeth had on the education of Stanford medical students over the years. Her role in helping to develop and shepherd in the new curriculum, her work behind the scenes to for our recent successful LCME accreditation, and her counsel to a number of Senior Associate and Associate Deans are but a few of her contributions over a distinguished career. Best wishes to Elizabeth.

Upcoming Events

31st Katherine D. McCormick Distinguished Lecture

Wednesday, January 30

8:00 pm

Braun Auditorium, Chemistry Building

Elizabeth G. Nabel, MD, director of the National Heart, Lung and Blood Institute, NIH, will deliver the 31st Katherine D. McCormick Distinguished Lecture, “**Genomic Medicine and Progeria: Cardiovascular Insights Gained from Premature Aging**” at Medicine Grand Rounds on Wednesday, January 30. Dr. Nabel joined the NHLBI in September 1999 as the Institute Scientific Director of Clinical Research. Prior to joining the NIH, she served on the faculty of the University of Michigan, becoming Director of its Cardiovascular Research Center in 1992, Professor of Internal Medicine and Physiology in 1994, and Director of the Division of Cardiology in 1997. While at the University of Michigan, she became known for her research in the field of vascular biology and molecular cardiology and for her gene transfer studies of the cardiovascular system. For further information, contact [Jennifer Scanlin](#).

Science Education in the 21st Century: Are Science and Religion Compatible?

March 9th

2:00 – 4:00 pm
Memorial Auditorium

For some time, Dr. Mark Kay, Dennis Farrey Family Professor in Pediatrics and Professor of Genetics, has been working with Mark Gonnerman, Director of the Aurora Forum at Stanford, to facilitate a Forum on Religion and Science. He has recently informed me that his persistence has paid off. On March 9th Lawrence Krauss and Richard Dawkins will speak on “Science Education in the 21st Century: Are Science and Religion Compatible?” We are grateful to Dr. Kay for his leadership in helping to develop this important program.

Awards and Honors

- ***Dr. Bigwei Lu:*** In late December the McKnight Endowment Fund for Neuroscience announced its six recipients of the Neuroscience of Brain Disorders Awards “to support innovative efforts aimed at translating basic laboratory discoveries in neuroscience into clinical benefits for patients. Some 197 letters of intent were submitted to the foundation and Dr. Bigwei Lu, Assistant Professor of Pathology, was one of the six awardees. His project is entitled “Understanding the molecular basis of synaptic dysfunction in Alzheimer’s disease”. Please join me in congratulating Dr. Lu.
- ***Dr. Philip A Beachy*** became the first incumbent of the newly established Ernest and Amelia Gallo Professorship, which has been created in recognition of the generosity of the Ernest Gallo Foundation along with Joseph E. and Ofelia Gallo and Mary Gallo. The investiture was celebrated in a lovely dinner on December 18th in Encina Hall, Bechtel Conference Center. Congratulations to Dr. Beachy.
- ***Dr. Hugh O’Brodivich*** began his tenure as incoming chair of Pediatrics by delivering the Lawrence G. Crowley Distinguished Lectureship. This was a particularly fitting beginning since Dr. Crowley, who served as acting dean, vice president for medical affairs and president of Stanford Hospital, was one of the key figures in the establishment of the Lucile Packard Children’s Hospital. We owe our appreciation and gratitude to Dr. Crowley. And of course I also want to welcome Dr. O’Brodivich and wish him every success as he takes over the leadership of pediatrics at Stanford.
- ***Dr. Abby King***, Professor of Health Research and Policy and of Medicine, was selected to be one of 13 scientists on the HHS Secretaries Committee for Health People 2020, clearly recognizing her reputation and accomplishments in medical science.
- ***Dr. Scott L. Delp***, the Charles Lee Powell Professor of Bioengineering, Mechanical Engineering and Orthopaedic Surgery (by courtesy) has been selected to receive the 2008 Van C. Mow Medal, awarded by the American Society of

Mechanical Engineers. The award is bestowed upon a single individual each year who has made significant contributions to the field of bioengineering.

- ***Dr. David Gaba***, Professor of Anesthesia and Associate Dean for Immersive and Simulation-based Learning is the recipient of the 2007 Teaching Recognition Award for Achievement in Education from the International Anesthesia Research Society. This award is designed to recognize outstanding career contributions by senior faculty.

Appointments and Promotions

- ***Aijaz Ahmed*** has been promoted to Associate Professor of Medicine (Gastroenterology & Hepatology) at the Stanford University Medical Center effective 1/01/08.
- ***Daniel A. Arber*** has been reappointed to Professor of Pathology at the Stanford University Medical Center, effective 12/01/07.
- ***Anne M. Dubin*** has been reappointed to Associate Professor of Pediatrics (Cardiology) at the Lucile Packard Children's Hospital, effective 2/01/08.
- ***Dan Eisenberg*** has been appointed to Assistant Professor of Surgery at the Palo Alto Veterans Affairs Health Care System, effective 12/01/07.
- ***David M. Hovsepian*** has been appointed to Professor of Radiology at the Stanford University Medical Center, effective 12/01/07.
- ***Paul M Maggio*** has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 12/01/07.
- ***Carlos E. Milla*** has been appointed to Associate Professor of Pediatrics (Pulmonary) at the Lucile Packard Children's Hospital, effective 12/01/07.
- ***David N. Rosenthal*** has been reappointed to Associate Professor of Pediatrics (Cardiology) at the Lucile Packard Children's Hospital, effective 2/01/08.

Dean's Newsletter January 28, 2008

Faculty Leadership

On January 15th we celebrated the graduation of the 2007 Faculty Fellows as they completed their year-long program sponsored by the Office of Diversity and Leadership (ODL). Over the course of the year, the fourteen junior faculty members who had been

chosen as Fellows participated in discussions of the personal leadership journeys of Medical Center and University leaders that served as case studies for reflection and dialogue. They also participated in small group discussions with their assigned faculty mentor and, importantly, developed individual leadership goals they will pursue over the next year. This is the second year of this program, which is garnering rave reviews by its participants.

Since the inauguration of the ODL under the leadership of Senior Associate Dean Dr. Hannah Valantine, the School of Medicine and the Medical Center have launched a number of leadership training programs, the common goal of which is to foster the career development of faculty – and of course, to help create and develop a new generation of faculty leaders. At the January 15th event, senior faculty members who nominated each Faculty Fellow offered comments on the reasons why they chose their nominee and what they hoped they would achieve from the program. The Faculty Fellows also reflected on what they learned from the program and how it has changed their career plans and pathways.

Several common themes emerged, a number of which are consonant with those that were enunciated by the Faculty Fellows who participated in the inaugural 2006 program. One consistent comment was how the Faculty Fellows Program made each individual feel more closely aligned to the Medical School and the University. Virtually each individual commented that they now had a better understanding of the goals and objectives of the medical school and how they could be a part of its inner workings. Equally important, many Fellows noted that because of this they now felt more bonded to Stanford and thus less likely to leave. In fact, several commented that they rejected recruitment offers because they now felt closer to Stanford and its missions.

Another theme that emerged was that individuals who initially felt somewhat daunted by the success of those they found at the helm of the institution now felt that they too could be successful over time. They observed and noted common themes for success – a sense of mission, passion, and integrity – and the ability to be flexible and take on new career directions that had not been foreseen or planned.

Importantly, the Faculty Fellows described how much they learned from each other and also how important their senior faculty mentors had been to them in building personal confidence and sharing perspectives on career and personal development. I would add to this that I am impressed at the way that traditional stereotypes are being broken in this program. Specifically, basic and clinical Faculty Fellows formed new alliances and sources of support, while Senior Mentors from both basic and clinical science were helpful to Fellows from different backgrounds and disciplines. I would like to express my appreciation to the four 2007 Senior Faculty Mentors, who played such an important role in this program. Specifically, deeply felt appreciation to:

- ***Dr. Linda Boxer***, Professor Medicine and Chief of the Division of Hematology
- ***Dr. Suzanne Pfeffer***, Professor of Biochemistry

- **Dr. Oscar Salvatierra**, Professor of Surgery Emeritus and Medical Student Faculty Advisor
- **Dr. Gary Steinberg**, Bernard and Ronni Lacroute-William Randolph Hearst Professor of Neurosurgery and Chair of the Department of Neurosurgery

The 2007 Faculty Fellows also expressed their and sincere appreciation and gratitude to Dr. Valentine for her tremendous leadership and commitment to this program and to each of them. They also expressed special thanks to Dr. Claudia Morgan, Associate Director, Jennifer Scanlin, Program Coordinator, and Julie Mosley, Director, Organizational Effectiveness. Thanks also go to Lydia Espinosa for her role in coordinating the details of the program and events.

I want to congratulate the 14 Faculty Fellows who completed the 2007 Program. They were:

- **Dr. Manuel Amieva**, Assistant Professor of Pediatrics
- **Dr. Maxwell Boakye**, Assistant Professor of Neurosurgery
- **Dr. Stephan Busque**, Associate Professor of Surgery
- **Dr. LaVera Crowley**, Assistant Professor of Pediatrics
- **Dr. Mark Genovese**, Associate Professor of Medicine
- **Dr. Gary Gold**, Associate Professor of Radiology
- **Dr. Cheryl Gore-Felton**, Associate Professor of Psychiatry and Behavioral Sciences
- **Dr. Amreen Husain**, Assistant Professor of Obstetrics and Gynecology
- **Dr. Sheri Krams**, Associate Professor of Surgery
- **Dr. Michael McConnell**, Associate Professor of Medicine
- **Dr. Sylvia Plevritis**, Associate Professor of Radiology
- **Dr. Phil Tsao**, Associate Professor of Medicine
- **Dr. Ann Weinacker**, Associate Professor of Medicine
- **Dr. Sherry Wren**, Professor of Surgery.

Of note, many of these Faculty Fellows have already assumed various leadership positions and others are about to assume new ones in 2008. As I mentioned at the dinner, we frequently review the list of graduates of these programs for leadership opportunities within the Medical School and the Medical Center.

Going forward, it is important to seek ways of bringing these groups back together so that the successful networking and support that commenced during the program can be sustained and enriched in future years. Certainly we also want to make this program available to additional individuals and, in fact, the 2008 Faculty Fellows Program will commence in a few weeks. I would also hope that we can retain the diversity of the group and also to add more basic science faculty to future programs.

I certainly recognize how busy our faculty are and that programs like this require extra time and effort. But I think it is safe to say that all who participated in the program felt

that the sacrifices they needed to make to attend the events were completely worthwhile. I thank them for doing so – and thank all who led and supported this important program.

Faculty Job Satisfaction

Because of our interest and commitment to our faculty we elected to participate in a pilot program sponsored by the Association of American Medical College (AAMC) in partnership the Collaborative on Academic Careers in Higher Education (COACHE). Ten institutions participated in this survey, which was conducted in the summer of 2007. The response rate for Stanford faculty who received the survey was 38% (296 of 775), so definitive conclusions cannot be forthcoming. The response rate was 34.2% for male and 50% for female faculty members who received the survey. The response rate was higher for underrepresented minorities than white faculty and was comparable for basic and clinical science faculty.

The data report we received in December 2007 compared Stanford faculty respondents to those from three “peer schools” as well as for all medical schools in the survey. Subsets of analysis of scores according to race, gender, and clinical vs. basic science faculty were also provided –in comparison to peer institutions, to all participating schools, and within Stanford.

While the data are limited by the sample size of the respondents, among other factors, the AAMC and COACHE leaders asked that the data be shared. Based on the ratings in the various categories and items, they provided items that Stanford faculty rated significantly higher than peer institutions as well as the whole group of medical schools in the survey. They also provided comparison within Stanford, but here the numbers are smaller and require more scrutiny. In the spirit of transparency and to provoke further questioning and discussion, I am listing below the items rated significantly more positive as well as more negative compared to three other peer schools. In subsequent communications we will share more of the data.

1. Stanford Faculty rated 25 items significantly *higher* than faculty at peer institutions:

a. Satisfaction with:

- i. Incentive compensation, such as bonuses
- ii. Housing benefits
- iii. Tuition benefits for dependents
- iv. Spousal/partner hiring assistance
- v. Parental leave policies
- vi. Availability of childcare offered by the medical school
- vii. Quality of childcare offered by the medical school
- viii. Institutional assistance in finding offsite childcare
- ix. Communication from the Dean’s Office to faculty about the medical school
- x. The Dean’s priorities for the medical school
- xi. The pace of decision-making in the Dean’s Office

- xii. Opportunities for faculty participation in governance of one's department
- xiii. Communication from one's Department Chair to the faculty about the department
- xiv. The Department Chair's priorities for the department
- xv. How well the location of one's clinical practice functions overall
- xvi. The medical school as a place to work

b. Agreement that:

- i. One's work is appreciated by one's patients
- ii. One's work is appreciated by the Dean's Office
- iii. The workplace culture of the medical school cultivates interdisciplinary work
- iv. The workplace culture of the medical school cultivates entrepreneurialism
- v. The workplace culture of the medical school cultivates excellence
- vi. The medical school is successful in retaining high quality faculty members.
- vii. One's department does a good job explaining its overall financial situation to the faculty
- viii. One's department does a good job explaining departmental finances to the faculty.

2. Stanford faculty rated 12 items significantly *lower* than faculty at peer institutions:

a. Satisfaction with:

- i. The value the medical school places on teaching/education
- ii. The value the medical school places on community service
- iii. The value one's department places on community service
- iv. Usefulness of feedback from one's unit head on career performance
- v. The pace of one's advancement at the medical school
- vi. Health benefits
- vii. Opportunities for physician input in management decisions.

b. Agreement that:

- i. One's work is appreciated by one's immediate supervisor
- ii. The requirements for teaching/education are clear
- iii. The requirements of institutional service are clear
- iv. The requirements for institutional service are reasonable
- v. The criteria for promotion are consistently applied to faculty across comparable positions.

As I noted above, the data were also provided according to gender, minority status, and clinical vs. basic science faculty, both within Stanford and in comparison to peer and all ten medical schools surveyed. There is considerable overlap of the issues rated both

positively and negatively. While the intra-Stanford data are important, because the numbers are smaller, I am not listing them at this time. We plan further discussions of the survey and of the question of when to repeat it so that we might achieve a higher number of respondents and thus make the data more robust. That said, I am sure that some of the items rated more positively or negatively compared to three other peer schools will ring true to some of you – and perhaps not to others. But I hope this will provoke your interest, as it does mine. My goal is to do all we can to improve the environment for our faculty, students and staff – and highlighting what we do well and what we need to improve is important. The next step is to further assess the areas where we appear to be falling short of expectation and work to improve them. At this time, I am not offering opinions, conclusions or recommendations about these data beyond this decision to share them openly and transparently. That said, I am interested in your feedback and comments.

More Scrutiny on Conflict of Interest

I have written frequently about the increasing attention being paid to conflict of interest (COI) at academic medical centers. These concerns have garnered heightened interest in light of a report issued on January 17th by the Office of the Inspector General (OIG) on the oversight provided by the National Institutes of Health (NIH) on the management of conflicts of interest at extramural institutions. According to the report, its observations were based on a review of more than 400 financial conflict of interest reports filed with the NIH by extramural research grantees during 2004-2006, few of which provided any data on the nature of the conflicts or how they were handled. Based on this the OIG recommended that NIH increase its oversight of extramural institutions to ensure compliance with federal financial COI regulations. The OIG also recommended that extramural institutions be required to provide details of the nature of the conflicts and how they were managed, reduced or eliminated. Further, the OIG recommended that the NIH institutes and centers forward all financial COI reports to a centralized office and ensure that the information is maintained in an NIH database.

The NIH reacted to the report with a statement that it did not agree that central management was appropriated or needed at this time since COI is handled by extramural institutions for its grantees. The Association of American Medical Colleges issued a statement in response to the report stating “the AAMC supports two of the three recommendations issued by the Inspector General—both of which call on the NIH to strengthen its internal administrative systems of conflict of interest oversight. The AAMC joins the NIH, however, in rejecting the third recommendation, which would require the agency to become involved in research institutions' own management of specific conflict of interest cases in a manner that is unfeasible and beyond the NIH's existing statutory authority.”

Given the increased scrutiny on COI issues during the past several years in the lay press as well as in Congressional inquiries, it seems likely that further actions will be forthcoming. We have spent considerable effort to have robust, thoughtful and responsive conflict of interest policies and procedures at Stanford and will certainly continue to be as diligent as we can be. It is imperative that each faculty member take personal

responsibility to assure that disclosures are accurate and that adherence to conflict of interest issues is carefully performed. If you have any questions about conflict of interest at Stanford please review <http://med.stanford.edu/coi/> including the section entitled “*Tips for Avoiding Conflicts of Commitment and Interest*” (<http://med.stanford.edu/coi/tips.html>).

Input on Genetics Search Requested

As you may know, Dr. Rick Myers, Stanford W. Ascherman, M.D., F.A.C.S. Professor, will be stepping down as chair of the Department of Genetics to pursue new opportunities during an administrative leave that will begin this summer. I want to thank Dr. Myers for his leadership and the many significant contributions he has made to the Department and School, including important efforts in enhancing the diversity of our community. Dr. John Pringle, Professor of Genetics, has agreed to serve as the interim chair beginning this Spring and I grateful to him as well. I am confident that the department will continue to flourish while a new chair is being identified. Dr Lucy Shapiro, Ludwig Professor of Cancer Research and Director of the Beckman Center for Genetic and Molecular Medicine, is leading a search committee of distinguished faculty to identify a chair through a national search, and I am grateful to her and the committee for their efforts.

The School of Medicine is seeking an accomplished scientist in the fields of genetics, genomics, or both, with the creative vision to lead and shape the future of a distinguished and innovative Department of Genetics. The opportunities for interdisciplinary research and education across the university and the prospect for translating discoveries to our hospital partners – a hallmark of Stanford – makes this an exciting leadership position. The Search Committee welcomes your input. If you have suggestions of individuals who you think should be considered for this important position, please share them with Dr. Shapiro by February 15th. As you know, Stanford University is an equal opportunity employer and is committed to increasing the diversity of its faculty. It welcomes nominations of, and applications from, women and members of minority groups, as well as others who would bring additional dimensions to the university's research, teaching and clinical missions.

STRIDE Anonymous Biospecimen Locator

Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, asked me to share the following message with you:

One of the objectives of the School's Center for Clinical Informatics' STRIDE project is the creation of a system that will provide access to information on biospecimens stored in banks across the School. The STRIDE Anonymous Biospecimen Locator allows Stanford researchers to search for suitable samples without having to know, or expose, any protected patient-specific information. Having determined if suitable specimens exist in one of the constituent biospecimens banks, a researcher can use a Web-based request form to obtain additional information from the appropriate bank operator(s).

The first biospecimen bank now searchable using this system is the Stanford Cancer Center Pathology Core Tissue Bank, which is housed in the STRIDE database. The Cancer Center Pathology Core Tissue Bank, Directed by Jonathan Pollack MD, PhD, consists of almost 8000 frozen tissue samples from over 5,000 distinct patients. New tissue samples are added daily. Additional biospecimen banks are being added to STRIDE for searching by the system.

The STRIDE Anonymous Biospecimen Locator searches for tissues matching user-entered criteria, such as Organ Site, Pathological Diagnosis, Cancer Type, Patient Gender, Age at Biopsy/Autopsy, Minimum Tissue Amount, Tissue Source and Consent Type. A successful search returns only the number of specimens found - no patient data is disclosed. If a search finds matching tissue you can generate a Web-based request to the Cancer Center Pathology Core Tissue Bank. For additional information on this, or other components of the STRIDE Project, visit the STRIDE Web site or send email to sccinfo@med.stanford.edu

To access the STRIDE Anonymous Biospecimen Locator system go to <http://clinicalinformatics.stanford.edu/STRIDE/bsl-ats.html>

Storage of Laboratory Samples

The catastrophes that followed Hurricane Katrina and the floods that impacted medical schools in Houston several years ago have prompted us to consider ways of assuring the safety of one of our most important resources – the faculty samples and data accrued by our research faculty. Accordingly, the School of Medicine is working to implement recommendations made by consultants last year to improve efficiency and reduce risks inherent in our current on site laboratory sample storage procedures. The imperatives for addressing this issue include:

- Risk to samples (disaster, electrical failure, equipment failure, mislabeling, loss)
- Environment (the huge carbon footprint caused by our current system)
- Cost (very high utilities costs)
- Space

The recommendations we will be implementing over the next 12 months include:

1. ***Preferred vendor for freezers, freezer maintenance, and emergency repair/response:*** Stanford's purchasing department and SOM staff will be interviewing and surveying faculty and lab managers for their preferences before choosing one or two preferred vendors from whom SOM will purchase freezers in the future. This will ensure the best price for quality new freezers and establish a standard that will allow for easier maintenance. Advantages include energy efficiency, better maintenance and emergency response, smaller freezer space requirements, and lower costs to both school and PIs.
2. ***A red-tag program*** will be established for trading in aging freezers for new models to reduce the average age of freezers.

3. **Freezer back-up program:** approximately six freezers held empty and ready to store important samples in case of breakdowns, power outages or other emergencies.
4. **Out-of-state long-term storage:** We will choose a vendor for the safe storage of long term, highly important or redundant samples.
5. **Midterm storage:** We will implement central freezers within buildings and/or “freezer farms” on or near campus to store samples used less frequently.
6. **Inventory systems to identify and track samples:** an inventory system will be chosen and implemented over time for long- and mid-term samples. Inventory systems reduce the risk of loss, and save energy through regular purging of unnecessary samples. They also allow shared storage facilities and the ability for the PI to track exact sample location.

The first step in moving forward with these programs is to gather information from PIs and lab managers in order to choose the best possible preferred vendors and products. Please encourage your PIs to attend the interview sessions currently being scheduled, and to answer the survey that will be coming out in the next few weeks.

Update on the Department of Anesthesia

At the January 18th Executive Committee meeting, Dr. Ron Pearl, Chair of Anesthesia provided an update on the activities of the department. He provided the following summary of his presentation.

The Anesthesia department at Stanford has expanded over the past decade in response to the ongoing expansion of surgical services. Since 2000, anesthesia billings have doubled and now exceed \$80 million per year. Anesthesia hours have increased by 50% to 60,000 hours annually, and clinical FTEs have increased to 75 between Stanford and the VA. Overall, anesthesia is the third largest clinical department (after medicine and pediatrics) in the medical school. The highly complex surgical procedures performed at Stanford have required progressive sub-specialization within the anesthesia department. Pediatric anesthesia is the fastest growing subspecialty in the department, accounting for almost one-third of the clinical activity. In addition to providing anesthesia services in the operating room, the department has an active pain management program (including co-management with psychiatry of the only multidisciplinary inpatient service in the western United States). The department participates at the attending, fellow, and resident levels in all four adult critical care services (medical-surgical ICU, cardiothoracic ICU, surgery-trauma ICU, and VA ICU), and provides medical acupuncture for adults and children.

Anesthesia has been active in all aspects of education, from undergraduate through fellowship training. The 66 residents are chosen from the best applicants in the country. Juli Barr is the director for the required critical care fellowship for the medical students, Audrey Shafer is the co-director for the Biomedical Ethics and Medical Humanities

Scholarly Concentration and the new Translating Discoveries series, and David Gaba and Steve Howard have established the role of medical simulation for both education and research in anesthesia and medicine. The department offers 11 undergraduate and medical school courses and 16 medical school clerkships. This year one out of every 8 graduating Stanford medical students is applying to anesthesia residency programs. Stanford is currently the only institution west of Texas that offers all four ACGME-approved anesthesia fellowships (cardiac, pediatric, pain, and critical care).

The department has been actively expanding its research programs, with a doubling in NIH funding over the past five years. The research is highly collaborative, involving almost all the basic science and clinical departments in the medical school, as well as departments in the university and beyond. Major areas of research include mechanisms of anesthesia, pain, neuroscience, cardiopulmonary physiology, clinical pharmacology, and clinical outcomes. In general, each research area spans the spectrum from basic laboratory research to experimental human studies to clinical trials. The department consistently ranks among the top three in the country in academic productivity in all of the anesthesia subspecialties.

I want to thank Dr. Pearl for his leadership and the faculty for their many accomplishments.

Planning for the Centennial – Preview of Coming Attractions

As many of you know, 2008 marks the Centennial of the establishment of the Stanford University School of Medicine. The Medical School was established through the acquisition of San Francisco's Cooper Medical College by Stanford University, on January 31, 1908. Moreover, Cooper Medical College itself had been founded fifty years prior, in 1858, by Dr. Elias Cooper and was the first medical college in the West. Also of note, in 1959, some fifty years after the School became part of Stanford University, the School moved from San Francisco to Palo Alto. So the School of Medicine has a long and rich history punctuated by these significant, transforming events.

During the Centennial Celebration we will take many opportunities to look back over the past 100 years and forward to the next 100. We will mark the occasion in small and large ways, both virtual and actual. Starting in mid-February, look for our Centennial website, a series of Medical Center Report stories, and commentary in these pages that will highlight significant events, people and perspectives of our past as well as emerging trends for our future. Banners hung around the School will be a visual reminder, and we will make available a Centennial logo that you will be able to add to your stationery and/or email signature. Selected annual lectures will be highlighted as Centennial lectures. In April, our Alumni Weekend will have a Centennial theme and, also in April, we will have a School-wide celebration to which everyone will be invited. These festive occasions will include an event related, hopefully, to the groundbreaking for the new Learning and Knowledge Center and will thus point definitively and strikingly to the future. We will conclude our celebration at this year's Commencement in mid-June.

The Centennial offers us a great chance to reflect on our past as we continue to plan for our future. I hope you will join me in celebrating the first century of excellence of the Stanford University School of Medicine.

A Medical Mystery in 11 Sentences

Dr. Audrey Shafer, Professor of Anesthesia, asked me to announce an interesting challenge. Dona Tversky, SMS IV, is the director of a contest for an 11 sentence medical mystery. They have let me know that Joshua Spanogle, MD '07 has started an 11 sentence medical mystery and challenges the Stanford community to finish it. The story begins:

"Nothing in his months of planning--the selection of which carrier for which drug, the choice of who and how and when--had prepared him for this much screaming."

The next ten sentences are up to you. Submit your sentence to dtversky@stanford. While the first sentence is apparently due today (another challenge) additional ones will be called for each week. Weekly winners will receive a \$20 gift certificate to the Stanford Bookstore. The story will come to its exciting conclusion on April 3 at the annual Stanford Writers Forum where the 11th sentence will be revealed and the writer will receive a \$50 gift certificate. According to Dona Tversky, the competition is open to students, alumni, faculty, staff, housestaff as well as volunteers and family members with an affiliation to the School of Medicine or Stanford or Packard Hospitals. However, no more than one entry per week per participant is permitted. You can email your sentence to dtversky@stanford.edu and if you are interested in reading the story as it unfolds you <http://bioethics.stanford.edu/arts/>

You are also invited to the Stanford Writers Forum that will be held on April 3rd at 5 pm in the Clark Center Auditorium. In addition to the "conclusion" of the 11-sentence medical mystery, the Writers Forum will feature:

Blake Charlton reading science fiction from "Spellwright"

Sarah Bein reading poetry from "33 Hats for Julia"

David Kearns reading from his novel "Standard of Care"

For additional information go to: <http://bioethics.stanford.edu/arts/>

The Association for the Accreditation of Human Research Protection Programs (AAHRPP) is coming to Stanford

In March 2006 the Stanford HRPP - our Human Research Protection Program – received full accreditation from AAHRPP. This "gold seal" accreditation signifies our commitment to the most comprehensive protections for research participants and the highest quality research.

As part of the triennial accreditation cycle, AAHRPP will be visiting our campus this Fall. We will be calling on our human subject research community for the same support

and involvement that contributed to our full accreditation. Education and information pertaining to our HRPP is provided by the Research Compliance Office – look for these continuing opportunities throughout the year.

Questions about the Stanford HRPP? Visit the [Human Subjects Research website](#) or contact the [HRPP Education Specialist](#) (phone: 650-724-7141).

Remembering and Honoring Dr. Arthur Kornberg

On Friday, January 25th the School of Medicine held a Tribute in the Dinkelspiel Auditorium to Dr. Arthur Kornberg, who died on October 26 2007. As amply noted in the stories surrounding his life and death, Arthur Kornberg was a towering figure – among the most distinguished scientists and leaders of the 20th Century and our time. A passionate and extraordinary scientist whose love for seeking knowledge lasted throughout his life and to the very time of his death at 89 years of age, he was a revered and respected teacher, mentor and colleague. Not only did he found the Department of Biochemistry at Stanford in 1959, but, in addition, he and his colleagues literally shaped the future of the School of Medicine and the University through the recruitment of extraordinary faculty and the training and development of future leaders. He was internationally renowned for his leadership and advocacy for science and especially the interrelations between chemistry and biology – and for his passion for the essential importance of enzymes. He was an educator for the scientific community as well as the public – and even published, at the end of 2007, a book of stories for children. He was also a beloved father, spouse and grandfather who included in his “extended family” many friends, students and colleagues.

At the ceremony commemorating Arthur Kornberg, colleagues, students, and members of his family described the impact of his work and life as each recounted the breadth and depth of his remarkable life and extraordinary contributions. **Dr. Herb Tabor**, an early colleague of Dr. Kornberg and Chief of the Pharmacology Section in the Laboratory of Biochemistry and Genetics at NIH reflected on “The Early Years of the Enzyme Section of the National Institutes of Health,” where Dr. Kornberg’s scientific career had its early foundation. This was followed by a reflection on the “Years at St. Louis and Stanford” by **Dr. Paul Berg**, Cahill Professor Emeritus, a colleague of more than five decades and by a commentary on “Three Decades of DNA Synthesis” by **Dr. Bob Lehman**, Hume Professor Emeritus, another of the original faculty members of the Department of Biochemistry.

Two of Dr. Kornberg’s distinguished students reflected on their experiences as graduate students: **Dr. Randy Schekman**, Professor of Molecular and Cell Biology at the University of California at Berkeley commented on his work in the 1970s and **Dr. Tania Baker**, EC Whitehead Professor of Biology at MIT, spoke about her experiences in the Kornberg lab in the 1980s. **Dr. Mark Krasnow**, current chair of Biochemistry, reflected on the Department of Biochemistry and the roles and transitions that occurred during Dr. Kornberg’s nearly 50 years as a department member. This was followed by comments by another long-time colleague and friend, **Dr. Charlie Yanofsky**, Morris Herzstein Professor of Biology and Molecular Biology, Emeritus on “Reflections from the

Stanford University Community” and by **Dr. Lucy Shapiro**, Ludwig Professor of Developmental Biology and Director of the Beckman Center who offered both “Reflections from the Stanford University School of Medicine” along with a video interview of Dr. Kornberg in which he offered his reflections on the importance of chemistry in the study of life.

Finally, Dr. Kornberg’s three sons each offered remarkable testimonials and tributes to their father: **Dr. Roger Kornberg** spoke about his father’s passion for science and discovery and its influence on him and generations of scientists; **Ken Kornberg**, a renowned architect, collaborated with his daughter Sophie to put together a moving video portrait of Dr. Kornberg’s life as scientist as well as a spouse, father and grandfather; and **Tom Kornberg**, a cellist as well as a scientist, joined with three colleagues to conclude the program with a moving playing of the Adagio of the Schumann piano quartet.

As I – and, I am sure, all who attended the celebration - reflected on the various commentaries, tributes and reflections that were offered during the ceremony I felt deeply proud to have known Dr. Kornberg, even if just for a limited time. I always thought of him as the towering figure he truly was – but thanks to the depth of these reflections I realized that he was truly bigger in life than I had imagined. He is certainly missed, but his contributions and impact will go on for many generations to come.

Celebrating Dr. David Hogness

On Thursday evening, January 24th faculty from the Departments of Biochemistry and Developmental Biology joined with me to honor David Hogness, Rudy J and Dauphine Donohue Munzer Professor of Developmental Biology and Biochemistry, Emeritus, for receiving the 2007 Japan Society International Prize for Biology. Dr. Hogness has been a member of the Stanford community since 1959 (he was part of the group that helped found the Department of Biochemistry at Stanford when the School relocated to Palo Alto). During the past several decades Dr Hogness’ contributions have proved seminal and critical and have helped define the fields of genomics and developmental biology. He and his students and colleagues (several of whom offered comments at the dinner) developed the techniques for genomic analysis, defined the TATA box, which is important in regulating gene expression, discovered that gene sequences include both exons and introns, and identified genes important in morphogenesis by developing the methods for “positional cloning” or “chromosome walking,” among many other seminal discoveries. His work paved the way for functional genomics and developmental biology as we know it today. It was clear from the testimonials provided by his faculty colleagues and students that he is deeply revered and respected as an outstanding scientists, teacher and mentor.

Awards and Honors

- **Dr. John Boothroyd**, Professor of Microbiology and Immunology, has been awarded the Leuckart Medal by the German Society of Parasitology for his contributions to the field of parasitology. This is the society’s most prestigious

award, and it will be presented during the Society's annual meeting on March 5-7 in Hamburg, Germany. Congratulations to Dr. Boothroyd.

- **Dr. Paul Yock**, the Martha Meier Weiland Professor in the School of Medicine and Professor of Bioengineering, will be recipient of the American College of Cardiology Foundation's Distinguished Scientist Award "for his development of intravascular ultrasound (IVUS) imaging and his other innovative contributions to vascular devices as well as cardiovascular education". Congratulations to Dr. Yock!
- **Dr. James Chang, Professor** and Chief of Plastic and Reconstructive Surgery, has been appointed Research Director for the American Society for Surgery of the Hand (ASSH). His responsibilities are to provide grants & mentorship to young investigators, to partner with the National Institutes of Health for new funding opportunities, and to develop prospective multi-center trials for clinical outcomes related to hand and upper extremity problems.
- **Dr. Henry Lowe and the Web & Systems Engineering team led by Michael Halaas** have been chosen by the AAMC to receive an Award of Excellence in the Electronic Communications for its Web Redesign. Among the comments that were cited in this award are:
 - "I have seen the future and it is the redesigned Stanford School of Medicine website"
 - "Any of our colleagues who want to see how the web can be used to its best advantage should visit med.stanford.edu"I confess some bias – this is a great achievement and special thanks to Michael Halaas, Henry Lowe and the IRT team. Please visit <http://med.stanford.edu/>.
- **Ruthann Richter** and **Tracie White** have received writing awards from the AAMC for articles that appeared in *Stanford Medicine*. Ms Richter received the Award of Excellence for her article, "Fog of War", about traumatic brain injuries, which was featured in the special issue on war and medicine. Ms White received the Award of Distinction for her article, "Silent Inferno" about the heat related deaths in the San Joachim Valley. Tracie's article was featured in the special issue on the impact of global climate change on health.
- **Dr David Fetterman**, Director of Evaluation in the Office of Medical Education has been selected the recipient of the Outstanding Higher Education Professional Award for 2008. Congratulations to Dr. Fetterman.
- The Edward Mallinckrodt Jr. Foundation recently awarded funding to **Dr. Gill Bejerano** for his study of specific loss of genomic regulatory regions: implications on human health and human evolution. Congratulations to Dr. Bejerano!

- **Mary Ayers** (IRT Education Technology) was honored today at the “Community Treasures” Recognition Brown Bag Lunch hosted by the University. Since 2004, Mary has led relay teams in fundraisers for cancer research. Congratulations Mary!

Appointments and Promotions

- **C. Andrew Bonham**, has been reappointed to Associate Professor of Surgery (Transplant Surgery) at the Stanford University Medical Center, effective 2/01/08.
- **Craig Comiter**, has been appointed to Associate Professor of Urology at the Stanford University Medical Center, effective 1/01/08.
- **Christopher H. Contag** has been reappointed to Associate Professor of Pediatrics (Neonatology) and of Microbiology & Immunology, effective 2/01/08.
- **Catherine Curtin** has been appointed to Assistant Professor of Surgery (Plastic and Reconstructive Surgery) at the Stanford University Medical Center and the Lucile Salter Packard Children’s Hospital, effective 1/01/08.
- **Jennifer Raymond** has been promoted to Associate Professor of Neurobiology, effective 1/01/08.
- **Debra L. Safer** has been reappointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 5/01/08.
- **Norman Silverman** has been reappointed to Professor of Pediatrics (Cardiology) at the Lucile Salter Packard Children’s Hospital, effective 1/01/08.

Dean’s Newsletter February 11, 2008

Dr. Steve Leibel Dies Unexpectedly

On Thursday, February 7th we received the tragic and unexpected news that Dr. Steve Leibel, the Ann and John Doerr Medical Director of the Stanford Cancer Center and Professor of Radiation Oncology, died in Hawaii, where he was on vacation with his wife Margy. Everyone who knew or interacted with Dr. Leibel feels his loss deeply. He was a highly valued colleague, leader and friend - and a genuinely kind, thoughtful and sincere person.

Dr. Leibel joined Stanford just four years ago as part of the leadership team I was assembling to help us prepare to become an NCI-designated Cancer Center. Prior to joining Stanford, Steve had been the chair of Radiation Oncology at Memorial Sloan

Kettering Cancer Center and was internationally recognized for his work in developing a number of novel approaches to delivering radiotherapy, including 3-D conformational and intensity-modulated radiation therapy. He was also recognized as an expert in prostate cancer as well as an outstanding radiation oncologist and national leader. He was president and chair of the American Society for Therapeutic Radiology and Oncology and recently received the society's gold medal, the highest honor given. He was also president of the American Board of Radiology, the board-certifying body for diagnostic radiology, radiation oncology and medical physics.

After coming to Stanford Dr. Leibel teamed up with Dr. Irv Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine and Principal Investigator for the NCI designated Cancer Center, Dr. Bev Mitchell, Deputy Director of the Stanford Cancer Center, and Dr. Karl Blume, Professor of Medicine, Emeritus, to lead Stanford's successful application to become an NCI designated center. This was a major undertaking, and Steve played a key role in our achievement (see: http://deansnewsletter.stanford.edu/archive/04_23_07.html#2).

Without question Steve Leibel will be deeply missed. Our hearts go out to his wife, parents and family - we have all lost a colleague, leader and friend. If you wish to offer remembrances or reflections about Steve that we will share with his family and friends please go the "[Steve Leibel Guestbook](#)". Information about a memorial tribute to Dr. Leibel's life will be forthcoming.

Seeking Quality and Balance

At this year's Strategic Planning Leadership Retreat, which took place January 31st - February 2nd, we addressed the theme of "quality and balance" in relation to our missions in education, research and patient care. This was the seventh annual Leadership Retreat I have led since coming to Stanford in April 2001. As with past events, we assembled nearly 100 faculty, students, and staff from across the Medical School, Hospitals, and University to participate in dialogue and discussion to help guide the future of the Medical School and Medical Center. The character and goals of each Retreat have varied. Some have provided reports and updates on past strategic planning efforts. Others have focused on new initiatives such as diversity and leadership. In the 2008 Retreat I felt we needed to think through some of the difficult challenges that lie ahead as we attempt to improve our quality and maintain the balance within and among our missions in a period of constraint – whether in funding, land use, faculty size, perceptions or expectations.

At each Retreat I always wish that we could engage our entire medical school and center community in the dialogue. There is a chemistry that emerges from each event that I firmly believe would enhance our efforts if it could be more broadly shared and experienced. But there is also the issue of the size, scope and dimension of any discussion and the stark reality that limits have to be drawn to permit effective dialogue. However, I am still very much interested in your ideas, comments and suggestions about the questions we discussed at the Retreat and invite you to review the issues and provide whatever insights you wish to make. You can do this by going to

<http://medstrategicplan.stanford.edu/retreat/> and addressing any of the questions you consider important. Or you can respond to individual questions below.

I chose the dual themes of quality and balance because they both compel us to establish priorities and choices. We all want to have the highest quality programs in education and research and we certainly want to deliver the highest possible quality in patient care. But how do we achieve and sustain that quality within the scope of resources? And how will the priorities we set impact our future directions?

As I have often pointed out, in comparison to many of our peers we are a small school of medicine. To sustain our uniqueness and excellence we have been building on our history and the work of those who came before us. We consider Stanford to be a research-intensive school of medicine, and we define our focus of excellence accordingly. We have to assure the quality and balance of our research efforts, which range from basic discovery to translational and clinical research. Tilting too much in one or another direction would change the character of our school, including its faculty and students, and could change us irrevocably. This is all the more so when our size is limited – whether by faculty billets, class size, facilities or resources. I commented on some of these issues when I outlined the challenges we face in 2008 in my January 14th Dean's Newsletter.

From my perspective the best way to prepare for the future is to plan for it and help guide it. This means asking difficult questions and then seeking solutions to what may be complex or apparently unsolvable problems. For example, we all know that the funding climate for research has changed significantly during the past several years and that the functionality of the healthcare system in the US is severely compromised. We cannot count on a change in government leadership to overcome the serious fiscal challenges facing our nation or the fact that the current economic downturn will likely impact the support we might have anticipated from philanthropy and foundations. At the same time we must recognize that we are fortunate to be at an institution like Stanford, which has resources –in human, intellectual and monetary capital –that if appropriately guided might lead to new models to preserve and even enhance our success now and into the future.

It is all too easy to assume an attitude of doom and gloom when economic or related events loom on the horizon – and it is certainly true that if we give in to those fears, they will become a self-fulfilling prophecy that will in fact be realized. And while one can't be Pollyannaish and live in denial, it is also true that we can make progress if we exercise creativity and optimism. It is also true that our ability to move forward is enhanced when there is a clear and transparent understanding of our individual and shared goals – which is certainly a major dividend of a retreat that brings the different members and constituencies comprising our medical center and university community into a common dialogue.

To promote dialogue, we conducted three panel discussions, each designed to elicit comments from attendees as well as the panel participants. In each case we received a number of thoughtful comments and suggestions. These will be formulated into action

items that we will address in coming months. As we proceed I also want to give you the opportunity to offer your comments on any questions you would like to address. You can either select the “review and comment” option following each question or you can go to the website noted above. Once we have comments from our broader community I will share the responses we received at the Retreat and also indicate the specific issues we will be addressing in the coming months and beyond.

Optimizing quality and balance in education:

- *How do we balance the goal of training leaders and future physician-scientists/scholars and bioscience students with balancing the diversity of interests and individuals we admit to Stanford? What is the right balance of students planning for careers in academia, industry, clinical practice and others?*

Review and Submit Comments »

- *How do we measure the quality of our education programs for MD students? More specifically, what methods should we use to evaluate student performance in addition to the courses, clinical rotations, mentoring and other education programs we offer? And how do assess whether the career paths our students are choosing are consonant with the goals we have set for our medical student education program?*

Review and Submit Comments »

- *How do we maximize and measure the quality of our educational programs for Ph.D. students? How can we provide incentives for faculty to invest effort in teaching? What kind(s) of monitoring and feedback will ensure that our courses cover the proper material, do it effectively, and serve both their core constituencies and students from other programs who need knowledge in that area? How do we assure that our curriculum and offerings are as valuable as we can make them?*

Review and Submit Comments »

- *How do we achieve breadth of training and interdisciplinary skills without sacrificing depth and mastery of one or more disciplines and without requiring an excessive duration of training? Are we really providing students with a broad choice of interdepartmental opportunities or, when all is said and done, are we restraining them to departmental affiliations? Can we do anything else to allow young scientists to achieve independence at an earlier age? Do we need new kinds of educational models or academic positions to achieve these ends?*

Review and Submit Comments »

- *How do we find the right balance in the quality of residents and other trainees coming to Stanford training programs to secure both outstanding clinical work - but also a stronger focus on professional development? How can these be balanced given the time limits now in place? How do we create a more medical center wide initiative for professional development and research opportunities for residents and clinical fellows that transcend the departmental boundaries that currently exist? How do we make our residents and clinical fellows become medical school and university citizens in addition to hospital and departmental employees?*

Review and Submit Comments »

- *Continuing Medical Education (CME) has largely followed a model of medical lectures and updates which are increasingly demonstrated to have little impact on the quality or outcomes of medical practice. How can we leap beyond the traditional models that exist at most academic medical centers and take a lead in transforming our continuing professional education programs so that they achieve the breadth and quality typical of other School of Medicine educational programs? How can we better utilize the resources that are now available on campus – and that will be abundantly so when the Learning and Knowledge Center opens in 2010 – to create a new paradigm for CME? **Review and Submit Comments »***

Enhancing Quality and Balance in Research

- *Recognizing that the quality and excellence in basic science is what distinguishes Stanford, how do we assure it remains outstanding in the future? **Review and Submit Comments »***
- *There is a feeling among a number of basic science faculty that they are being ignored in the current medical center and university environment. How should we address this? What do we need to do to assure that we have the best balance among our priorities and also the highest overall quality of our faculty for basic as well as translational and clinical research programs? **Review and Submit Comments »***
- *As we select faculty, how do we assure that we are really getting the highest quality individuals - in basic science and in clinical medicine? How do we balance programmatic needs with individual excellence? **Review and Submit Comments »***
- *How important is it to our research effort to solve the problem of inadequate and overcrowded research animal facilities and where does it fit in our assignment of research priorities? **Review and Submit Comments »***
- *What practical steps can we take to make sure that the goals of the hospitals and the school are more closely aligned in terms of allocating resources to the research mission of the medical center in translational and patient-oriented research? **Review and Submit Comments »***
- *As we approach the faculty billet cap, how will we choose among multiple departmental needs when each billet becomes available? What role can non-faculty positions play in meeting needs for which there are no available faculty billets? **Review and Submit Comments »***
- *What are the cultural parameters of a zero-sum game? How can we create a culture that acknowledges quality through measures other than accumulated resources – especially at a time when there may be constraints on resources or increased competition for them? **Review and Submit Comments »***

Fostering the Highest Quality Patient Care

- *The metrics currently used to measure clinical quality need to address clinical practice outcomes in a manner that allows comparisons across the nation. They must also have "local credibility" in order to drive clinical care processes. What are the similarities and differences that apply to: medical vs. surgical; adult vs. pediatrics; community vs. academic; innovation and clinical research vs. standardization and evidence-based medicine? **Review and Submit Comments** »*
- *What is the role of Informatics in fostering the highest quality patient care? How might Stanford leverage Clinical Informatics to improve the safety and quality of patient care? **Review and Submit Comments** »*
- *Do instruments for assessing clinical excellence need to be particularly good at identifying low-quality physicians or identifying high-quality physicians? Or should our efforts be dedicated to finding instruments that will distinguish clinical quality throughout the entire spectrum? **Review and Submit Comments** »*
- *How can we measure the clinical quality of individual providers, particularly when much care is dependent upon the work of teams? And how can we handle quality measurement for low-volume providers, such as UTL faculty who may devote 25% or less time to patient care activities, and across a wide spectrum of health conditions? **Review and Submit Comments** »*
- *How heavily should clinical performance be weighted in the different faculty lines - UTL, MCL, and Clinician Educator? What are the best incentives to put into place to promote superior clinical performance throughout SHC? **Review and Submit Comments** »*
- *How do we change the culture at Stanford so that it is focused on quality at all levels and dimensions? Given our faculty caps and clinical responsibilities, how do we ensure career development for each faculty line? **Review and Submit Comments** »*
- *How can we leverage quality and safety in our highly innovative and tertiary/quaternary care environments to enhance our institutional profile (e.g., payer contracting, public transparency, reputation, research)? **Review and Submit Comments** »*
- *How should we select the highest quality projects and opportunities to present to our donor community? How do we strike a balance between the multiple meritorious needs and expectations - especially between our primary missions in research, education and patient care? **Review and Submit Comments** »*

I am interested in your response(s) to any or all of these questions. As noted, in the coming weeks and months I will codify the input we received during the Retreat

along with comments you wish to submit into a prioritized action plan that we will then work on over the coming months. It seems clear that one of the important tasks before us is to consider models or approaches that will allow us to sustain the excellence of our basic research programs along with “translating discoveries” during the years ahead when our ability to leverage on federal sponsored research support will be more challenged.

In addition to the discussions noted above we also had two other themes for the Retreat. One was to seek lessons from other industries that might inform how we approach the challenge of sustaining quality and balance in an academic medical center. We had an interesting discussion about the lessons from the airline industry delivered by John Nance, noted author and airline pilot, who has written and spoken extensively about this topic. We also heard about lessons from the Pharmaceutical/Biotech industry, IT, Venture Capital and Hospital industries. These were further framed with discussions about instilling these lessons into our ongoing important initiatives in professionalism, leadership and diversity.

Second, we had the opportunity to reflect on the current and future role and goals of Stanford University from a keynote speech by John Hennessy, President of Stanford University that opened the Retreat. To bookend that broad perspective, our final session considered how the medical school and center relate to the major initiatives that are part of the Stanford Challenge: the Initiative on Human Health, the Initiative on Energy and the Environment and the International Initiative. Each evoked spirited and interesting discussions and further framed the exciting prospects for interdisciplinary education, research and service that is unfolding at Stanford.

In addition to sharing facts and figures, thoughts and perspectives, conceptions and misconceptions, one of the most valuable aspects of these retreats has been the community building that takes place among the participants. Whether one has attended all seven Retreats or whether this was the first, I feel confident that each attendee learned something about the medical school, medical center and university that she or he had been unaware of. Hopefully these insights also revealed the highly individualized as well as the broader institutional issues and challenges we face. And while I am confident that individuals reacted to the presentations and discussions through their own personal lenses, it is my hope that our community is more aligned – and more willing and able to work collaboratively to solve some of the challenges facing us in the months and years ahead.

2008 SUMMA Conference

Saturday, February 9th featured the 17th SUMMA (Stanford University Minority Medical Alliance) Conference. Hundreds of college and high school students from California visited the Stanford campus for an all-day event aimed at informing and empowering students interested in a career in medicine. As with prior SUMMA Conferences, our students are responsible for organizing and hosting this event – and they did so wonderfully well. Special thanks to the 2008 medical student SUMMA coordinators Marissa Aillaud, Carmen Butts and Veronica Ramirez along with undergraduate

coordinators David Chiang and Juliette Oram. Student attendees heard the personal stories and journeys of several current medical students as well as keynote addresses from Dr. Stacey Jolly (a Stanford alumna), who is currently a fellow in General Internal Medicine at UCSF, and Dr. Carlos Esquivel, Chief of the Division of Transplantation, Associate Director of the Institute for Immunity, Transplantation and Infection and the Arnold and Barbara Silverman Professor.

Students had the opportunity to attend three workshops featuring topics such as: MCAT Preparation, Applying to Medical School, Making Yourself a Better Applicant, the Interview Process, Study Skills and Time Management, Research Pathways, Non-traditional Pathways, and Civic Actions, among others. They also had the opportunity to meet with medical school recruiters from around the country.

Without question SUMMA had become one of the major signature events of Stanford Medical School. Along with other programs fostering opportunities for high school and college students, it is another example of reaching out to underrepresented minorities to help open the doors to careers in medicine and science. Thanks again to all of our current students and faculty who participated in this year's SUMMA Conference – and to those who have done so for the 16 preceding years as well.

2008 PRIDE Awards: Call for nominations

The Diversity and Leadership office has issued a call for nominations for the 2008 PRIDE Awards, (PRomoting Inclusiveness, Diversity and Empowerment). This award is given out annually in the amount of \$2,500 to celebrate a faculty member, a staff member and a trainee who contribute to creating and maintaining a culture of inclusion, create an environment that fosters diversity; broadly defined, contribute to the retention of underrepresented minorities and women and make accommodations for individuals with diverse needs.

To nominate a colleague for this award, please visit the [Diversity and Leadership website](#).

Selection of the 2008 Faculty Fellows

We are delighted to announce the selection of the 2008 Faculty Fellows. The Faculty Fellows program brings these faculty members together for monthly meetings featuring invited leaders who serve as role models by sharing their own leadership journeys, describing their own leadership styles and addressing specific challenges they have faced in their own careers. In addition, small mentoring groups led by senior faculty mentors meet once between each of the dinner meetings to discuss leadership challenges specifically and in general. Other topics, such as work/life balance issues, are also open for discussion.

Fellows also engage in a structured Development Planning process aimed at identifying opportunities for growth and development. The result is a personalized career development plan that they work with their chair or division chief to implement.

Candidates are nominated by their department chairs and other supervisors, and are ranked on the basis of leadership potential and demonstrated commitment to building diversity. A review committee consisting of Drs. Hannah Valantine, Julie Moseley, James Chang, Eric Sokol, and Claudia Morgan selected 16 fellows from a large pool of nominations.

We congratulate the 2008 Faculty Fellows: Ranjana Advani (Medicine), Howard Chang (Dermatology), Sanjeev Dutta (Surgery), Rebecca Fahrig (Radiology), Julieta Gabiola (Medicine), Jill Helms (Surgery), Paul Keall (Radiation Oncology), Christina Kong (Pathology), Joe Liao (Urology), Swaminatha Mahadevan (Surgery), Bruno Medeiros (Medicine), Carlos Milla (Pediatrics), Tirin Moore (Neurobiology), Upinder Singh (Medicine), Roland Torres (Neurosurgery) and Daya Upadhyay (Medicine).

Work Life Balance Symposium – March 5th

The Office of Diversity and Leadership presents “*Work-Life Balance in Academic Life: Myth vs. Reality*,” a symposium that will offer tools, tips and discussion about work/life balance on Wednesday, March 5 from 5:30 to 8:30 pm at the Arrillaga Alumni Center. This important and engaging symposium will be a combination of thoughtful presentations by a remarkable team of experts: Peter S. Moskowitz, MD, Linda Hawes Clever, MD, MACP, and Barry Rosen, MD; lively, interactive mini-workshops and a panel-led question and answer session. Dinner will be served.

All faculty, including clinician educators at instructors, are invited to attend. Participation in this symposium is limited to 100. To register, visit the [Diversity and Leadership website](#).

Upcoming Event: BILL GATES On Software, Innovation, Entrepreneurship, And Giving Back

Bill Gates, chairman and co-founder of Microsoft Corporation, will discuss the importance of digital innovation in driving our global economy and addressing societal issues and the benefits afforded by careers based in math and science.

 **Download Flyer**

Tuesday, February 19, 2008

3:45 p.m. - 5:00 p.m.

Memorial Auditorium

Stanford University

Doors open at 3:00 p.m. and close at 3:45 p.m.

An event for the Stanford Community

Ticket Information:

- The event is open to Stanford students, faculty, and staff.
- Free Admission. One (1) ticket per Stanford ID.

- Tickets must be picked up in person with Stanford ID at the Stanford Ticket Office.
- Limited tickets may be available at Memorial Auditorium on the day of the event.
- **Stanford Ticket Office location/hours:**

1st Floor, Tresidder Union

10:00 a.m. - 5:00 p.m., Monday-Friday

12:00 noon - 4:00 p.m., Saturday.

For further event information, please call: 725-2787.

Awards and Honors

- **Dr. Paul Auerbach**, Clinical Professor of Surgery (Emergency Medicine), has been named a “Hero of Emergency Medicine” by the American College of Emergency Physicians in recognition of his leadership in emergency and wilderness medicine. Congratulations to Dr. Auerbach.
- **Dr. Alexander Dunn**, Postdoctoral Scholar in Biochemistry, is one of 15 individuals selected from 146 applicants to receive a “Career Award at the Scientific Interface” from the Burroughs Wellcome Fund in recognition of “the scientific excellence and innovation of the [his] research proposal, the strength of the scholarly environment at Stanford University, and Dr. Dunn’s potential to establish an independent research career at the interface between biology and the quantitative, physical and theoretical disciplines”. Congratulations to Dr. Dunn.

Appointments and Promotions

Kelly E. Ormond has been appointed to Associate Professor (Teaching) of Genetics, effective 2/01/08l.

Dean’s Newsletter February 25, 2008

Striving for Quality and Balance

In the February 11th Dean’s Newsletter I invited you to comment on some of the questions discussed at the January 31st-February 2nd Strategic Leadership Retreat. Based on the comments I received from you and the distillation and analysis of the discussions that took place at the Retreat, I now want to share with you some of the initiatives I will be bringing forth during the next year. It is important to note that these are not all of our high priority initiatives, but rather those that relate to the Retreat theme of achieving excellence while being attentive to sustaining quality and balance among our missions in education, research and patient care. There are several overarching issues as well as ones that are mission- specific.

Some Overarching Issues

- One of the most important overarching issues we will be addressing on “quality and balance” over the next year will be reconciling our plans for growth (especially in clinical care initiatives) with the size and scope of our faculty and the potential limitations that may be imposed if the current billet cap remains fixed. For reference, our faculty billet cap is set at 900 and we are now at just over 800 full-time faculty. *This effort will be led by Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, and David O’Brien, Director of Institutional Planning.*
- Given the likelihood of continued constraints on research funding from the NIH and other federal sources, we need to develop new models for supporting and funding research in an era when federal funding is flat or declining. Included in this area is the need to better define financial support for graduate students and a different model for the use of endowed professorships. *To do this I will appoint a task force led by Marcia Cohen, Senior Associate Dean for Finance and Administration.*
- Because of the limitations of our size, resource restraints and the tensions that emerge from having missions in basic and clinical research as well as education and patient care, there is a continuing need to find ways to make all members of our community – students, staff and faculty – feel both engaged and valued. *This is something we all need to be part of and I will personally seek ways to help assure that we each share in securing the “quality and balance” of our community.*
- There is a need to continue to address academic and staff leadership succession planning, including an assessment of the impact of transitions of faculty and staff on resource consumption and strategic initiatives. *The Dean’s Office will take the initiative in working on this issue.*
- One of the greatest and most distinctive strengths of Stanford is the opportunity for interdisciplinary research and education. With the Stanford Challenge now underway (a topic we spent time discussing at the 2008 Leadership Retreat), it is clear that we need to find better ways to engage faculty and students in the Initiatives on Energy and the Environment as well as the International Initiative and the Initiative on Human Health. *The responsibility for this will lie with basic and clinical science chairs, Institute Directors and, of course, faculty and students. We will seek ways of making the opportunities that are available more broadly known and accessible to our community.*

Quality and Balance in Education

Medical Student Education

- We need to address ways to assure diversity in our medical student body within the context of our New Curriculum and our focus on training and developing physician

scholars, scientists and leaders. This will require addressing the alignment between our institutional goals, the criteria of our admissions committee and the expectations and goals of prospective and admitted students. In tandem with assuring diversity in our entering classes, we will also recommend ways to assure the success of minority students while at Stanford. *I will appoint a Task Force led by Dr. Charles Prober, Senior Associate Dean for Medical Student Education, to address this issue.*

- An observation and concern that emerges from various surveys and reviews is that we do not, as an institution, place sufficient value in clinical education (and, to a degree, in education overall) and the roles played by faculty in patient care activities in comparison with some of our peers. In tandem with this is the need to better determine the metrics by which to evaluate the clinical performance of medical students in a manner that is data driven and transparent. This is especially important as we seek to better define the tools used to evaluate student performance more broadly, including the official school letter (or “Dean’s Letter”). *A review of these important issues will be led by Dr. Charles Prober, Senior Associate Dean for Medical Education, in collaboration with Drs. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and Gabe Garcia, Associate Dean for Medical Student Admissions.*

PhD Education

- To improve the quality of graduate student education, we will initiate a peer review of current graduate courses by students and faculty. The questions to address include whether we are really educating students for the jobs they will eventually hold and whether there is enough breadth of topics, including ones that extend to business and law and that provide a wider breath of experience including “PhD Internships.” We also need to assess whether our graduate education programs are truly achieving the interdepartmental/interdisciplinary focus we espouse or whether they are really still more departmentally focused. *This review will be led by Dr. John Pringle, Senior Associate Dean for Graduate Education and Postdoctoral Affairs, and Dr. Ellen Porzig, Associate Dean for Graduate Education.*
- Without question, postdoctoral scholars and clinical fellows are among the most important members of our academic medical community but also among the most disenfranchised. We need to develop improved ways of integrating postdoctoral scholars into the broader missions and opportunities of Stanford and to assure mentoring and transitional appointments that better prepare them for faculty or other careers. *These issues will be addressed by Dr. John Pringle, Senior Associate Dean for Graduate Education and Postdoctoral Affairs, and Chequeta Allen, Assistant Dean for Postdoctoral Affairs.*

Graduate Medical Education (GME) and Continuing Medical Education (CME)

- We need to develop recommendations for programs that measurably improve the quality and diversity of GME programs. *This effort will be led by Dr. Myriam Curet, Senior Associate Dean for Graduate Medical Education.*

- We need to develop a fundamentally new approach to CME based on improving quality metrics of clinical performance and on more individualized education compared to traditional lecture formats. *I plan to appoint a Task Force led by Dr. Rob Jackler, Associate Dean for CME, to develop new and novel approaches that can make Stanford a leader in CME.*

Enhancing Quality and Balance in Research

- In addition to developing new financial models to support our missions in research during an era of constraint (see above) we also need to develop new models to support our research mission within Stanford, including how we use cores and shared services. This includes where they are located, how they are managed and funded, and how they can sustain a balance between service and innovation. *This effort will be led by Dr. Daria Mochly-Rosen, Senior Associate Dean for Research.*
- We have reached a critical phase in our planning for laboratory animal programs – including space (both onsite and offsite), financing and a better delineation of which models should be employed. Given the transition of leadership in Comparative Medicine that will occur in the next year, these and related issues are timely and important. They impact the School of Medicine as well as the rest of the University. *Accordingly, a review group will be led by Dr. Harry Greenberg, Senior Associate Dean for Research, and Dr. Ann Arvin, Vice Provost and Dean of Research.*
- Although we have made “*Making and Translating Discoveries*” our overarching institutional priorities, we have work to do in better defining how the Medical Center can achieve success in clinical and translational research as well as research that results in improved quality of patient care during a time of resource constraint. In considering this issue we need to better delineate how hospital based clinical research is supported and funded and who will carry it out. *A review of these issues will be assigned to Dr. Ken Cox, Senior Associate Dean for Pediatrics and Obstetrics Clinical Affairs, and Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs.*
- It has been observed that members of the Stanford community are often unaware of the research breakthroughs being made by their faculty and student colleagues. We need to develop better ways to communicate research discoveries and successes to our Stanford community. *This review will be led by Paul Costello, Executive Director of Communications and Public Affairs.*

Fostering the Highest Quality Patient Care

- During the past year several programs have been initiated to address quality performance at SHC and LPCH, and a Center for Quality and Efficiency is to be established. Because of this, we will not recommend new initiatives *per se*. That said, we need to continue to support these initiatives and also assess ways of

better linking them to efforts underway by our colleagues at the Palo Alto VA Medical Center. In conjunction with these efforts, we also need to better define the important role that our Clinician Educator colleagues play in enhancing our missions in education, clinical research and patient care. Importantly, we need to delineate ways to make the role of Clinician Educators more valued and appreciated. *This review will be led by Dr. David Stevenson, Vice-Dean and Senior Associate Dean for Academic Affairs.*

It is important to note that these initiatives are a subset of those that we will be working on during the next year. There are other major tasks we face – especially in the development and support for medical center facilities. But the outline above conveys the ways we will follow up on some of the important suggestions emerging from the 2008 Strategic Leadership Retreat. Again, if you have further questions or suggestions, please feel free to contact me.

Concerns about Proposed Changes to the USMLE

At a recent meeting of the Council of Deans we discussed the efforts underway by the National Board of Medical Examiners (NBME) to review and potentially revise the USMLE (United States Medical Licensing Examination). While there is great merit in developing ways to better integrate basic science into the clinical medicine, my colleagues and I expressed great concern at the prospect that the USMLE would be potentially postponed until the third year and that there would not be specific assessment on student's knowledge of the basic science that underpins modern medicine (see: http://www.usmle.org/General_Information/review.html). Indeed, such knowledge will prove only more important in future years as the genetics, genomics, proteomics, and the biological behavior of complex physical and mental disease become better understood.

While we recognize that knowledge acquisition in medicine must be a life-long endeavor, there is great value in periodic assessments and cross learning. While we also recognize the stress placed on students by having to assimilate a vast body of knowledge across many basic science domains, such intense review allows them to make connections that would not otherwise be possible – and helps set the stage for the evidence and science based learning that should help define the future of clinical medicine. With this in mind, the Council of Deans will join with numerous other organizations and societies to inform the NBME of the importance of having a USMLE testing at the completion of the preclinical years and as a focused assessment of knowledge in basic science. At the same time, we will also encourage the NBME to seek ways to better integrate knowledge in basic and clinical science and medicine in the USMLE parts 2 and 3 exams.

I want to share this information with you since it has not been as widely discussed as it should be. Thankfully the NBME is being attentive to the concerns being expressed about their earlier proposition to make the radical changes alluded to above. You may wish to bring this issue to your attention of your colleagues and related professional and scientific organizations and societies.

Centennial Events

I previewed in [my recent newsletter](#) the ways in which we were planning to commemorate the 100th anniversary of the establishment of the Stanford School of Medicine. Last week we began our activities virtually, with the launch of our [Centennial website](#) and the publication of an intriguing look at [Stanford then and Stanford now](#) as well as the posting of [images from our past and present](#). In addition, this week banners will go up around our campus, and event planning continues for the coming months.

It seems to me that, beneath the banners and images, although certainly facilitated by them, the Centennial affords us the opportunity to be reminded of the deeper truth that we stand on the shoulders of those who came before us. None of us would be here at the Stanford School of Medicine but for the efforts and accomplishments of the thousands of men and women who have striven for 100 years to make the School excellent in every respect – in education, in research and in the care of patients. The challenges our predecessors faced must have seemed as daunting to them as ours seem to us today, and we can look back with gratitude as their perseverance and success.

So I invite you to learn about the past hundred years of our School and participate in the celebration, even as we address our own challenges and find new opportunities for our own time – and the future.

Update on the Department of Obstetrics and Gynecology

At the Friday, February 15th meeting of the Executive Committee, Dr. Jonathan Berek, Professor and Chair of the Department of Obstetrics and Gynecology, gave an update on the progress that has been made in the department since he assumed the role of chair in December 2005. Below is his summary of what has transpired during the past two years.

The Department of Obstetrics and Gynecology is on a strong upward trajectory. Over the past two years, the department has experienced a substantial increase in the number of faculty and staff, in clinical productivity, in the vitality in each of its divisional education and research programs, and in the level of national recognition and stature. The clinical programs in the department have been invigorated and the reproductive biology research productivity is excellent and expanding. Each of the four clinical divisions--Maternal-Fetal Medicine (MFM) & Obstetrics, Gynecologic Specialties, Gynecologic Oncology, and Reproductive Endocrinology & Infertility (REI)--is formidable and has outstanding clinical and translational research components. The Division of MFM & Obstetrics combined with neonatology form the world-renowned and highly successful Johnson Center in the LPCH. The newly created Division of Gynecologic Specialties (renamed from General Gynecology) is functioning as a dynamic team with demonstrably improved academic and educational activities. Specialists in this reorganized division have nationally recognized expertise in urogynecology and pelvic reconstructive surgery, minimally invasive and robotic surgery, pediatric and adolescent gynecology, family planning and contraception, menopause, pelvic pain, infectious disease, and women's

sexual medicine. The Division of Gynecologic Specialties is now one of the finest in the country.

Integrated across all divisions are the basic research programs, the Reproductive Biology and Stem Cell Research (RBSCR) Program, and the Women's Health Program (WHP). Departmental collaborations with the Institutes have been improved and strengthened--the Stanford Cancer Center, Stem Cell Biology and Regenerative Medicine (ISCBRM), and Immunology, Transplantation and Infectious Disease (ITI), especially with its Center of Clinical Immunology at Stanford (CCIS) and the Human Immune Monitoring Center (HIMC). Program Project grant funding for the Cooperative Ovarian Cancer for Immunotherapy (COGI), which is based at Stanford, has just been extended for an additional 5 years. The Women's Cancer Program has just been established, integrating the Breast Cancer and Gynecologic Cancer Programs in the Stanford Cancer Center, which will increase clinical and translational research collaborations. The department receives grant support for the Women's Reproductive Health Research (WRHR) Scholars and the Building Interdisciplinary Research Careers in Women's Health (BIRCWH) Scholars programs. Future strategies include the creation of an interdisciplinary Women's Center of Excellence under the aegis of the Department of Obstetrics and Gynecology.

Many outstanding new faculty members have been recruited during the past two years. By the end of this year, the total number of UTL, MCL and CE positions will have increased from 30 to 42, and of the 39 who are full-time, 59% are women. Key departmental recruitments are Dr. Renee Pera, one of the most prominent embryonic stem cell researchers, recruited to assume the role of Director of the departmental Reproductive Biology and Stem Cell Research Program and to lead the embryonic stem cell program in the ISCRM, Dr. Paula Adams Hillard from Cincinnati to become the new Chief of the Division of Gynecologic Specialties, Dr. Paul Blumenthal from Johns Hopkins to become the Director of Ambulatory Gynecology and the Kenneth J. Ryan Program and Fellowship in Family Planning and Contraception, Dr. Judy Lacy from Toronto as a specialist in Pediatric & Adolescent Gynecology, Dr. Meg Juretska from Memorial Sloan Kettering Cancer Center to Gynecologic Oncology, Dr. Valerie Baker in REI to help to expand and sustain the In Vitro Fertilization (IVF) program, and Dr. Lisa Rahangdale from UCSF as a WRHR Scholar in Infectious Diseases.

The educational programs for medical students, residents and fellows in each of the divisions are excellent. Maximum achievable 5-year accreditation renewals by the American Board of Obstetrics & Gynecology have just been received for both the residency and for the MFM fellowship programs, under the direction of Vice Chair, Dr. Maurice Druzin. The overall ratings of the medical student clerkship, co-directed by Drs. Kim Harney and Cynthia DeTata, have risen significantly over the past 2 years and the program is now in the top tier of Stanford clerkships. The department has taken a leadership role in the development of simulators in obstetrics and gynecology training through the CAPE (Center for Advanced Pediatric and Perinatal Education) program directed by Dr. Kay Daniels and through collaborations with SUMMIT and the Goodman Centers directed by Dr. Mary Jacobson. The department has a very active Quality Management program. Faculty and staff are deeply involved in international outreach activities, including those in Eritrea, Guatemala, Mexico, and in many other developing countries via the Global Alliance for Women with Cancer and the Aid for International

Development programs. From 2006 to 2007, the department's ranking by the US News & World Report rose from 27th to 16th

The 2008 Faculty Fellows

The Office of Diversity and Leadership received a wealth of nominations for outstanding candidates for the 2008 Faculty Fellows program. The review committee was pleased to be able to select, in addition to a cohort of Faculty Fellows for 2008, an additional class of Fellows who will participate in this year long program beginning in 2009.

We are delighted to announce the selection of the following 2009 Faculty Fellows: Timothy Angelotti (Anesthesia), Juliana Barr (Anesthesia), Preetha Basaviah (Medicine), Helen Bronte-Stewart (Neurology), Kay Chang (OHNS), Waldo Concepcion (Surgery), Firdaus Dhabhar (Psychiatry), James Fann (Cardiothoracic Surgery), Lauren Gerson (Medicine), Jeffrey Gould (Pediatrics), Geoffrey Gurtner (Surgery), Michael Harbour (Medicine), Peter Kao (Medicine), Anna Messner (OHNS), Ruth O'Hara (Psychiatry), Stephen Roth (Pediatrics), Richard Shaw (Psychiatry), Rebecca Smith-Coggins (Surgery), Julie Theriot (Biochemistry), and PJ Utz (Medicine).

The Faculty Fellows program brings these faculty members together for monthly meetings featuring invited leaders who serve as role models by sharing their own leadership journeys, describing their own leadership styles and addressing specific challenges they have faced in their own careers. In addition, small mentoring groups led by senior faculty mentors meet once between each of the dinner meetings to discuss leadership challenges specifically and in general. Other topics, such as work/life balance issues, are also open for discussion.

Fellows also engage in a structured Development Planning process aimed at identifying opportunities for growth and development. The result is a personalized career development plan that they work with their chair or division chief to implement.

Candidates are nominated by their department chairs and other supervisors, and are ranked on the basis of leadership potential and demonstrated commitment to building diversity. A review committee consisting of Drs. Hannah Valantine, Julie Moseley, James Chang, Eric Sokol, and Claudia Morgan selected 16 fellows from a large pool of nominations.

Memorial Service for Dr. Steve Leibel is on March 19th

On Wednesday, March 19th the School of Medicine and Medical Center will host a Memorial Service for Dr. Steve Leibel, the Ann and John Doerr Medical Director of the Stanford Cancer Center, who died unexpectedly on February 7th (see: http://med.stanford.edu/special_topics/2008/steven_leibel/). The Memorial Service will be held in the McCaw Hall at the Arrillaga Alumni Center at 3 pm and will be followed by a reception. All are invited to attend.

Awards and Honors

- **Dr. Marlene Rabinovitch**, the Wight and Vera Dunlevie Professor in Pediatric Cardiology, has been selected to receive the 2008 Recognition Award for Scientific Achievement from the American Thoracic Society (ATS). The Recognition Award is “bestowed only upon those with lifelong outstanding scientific contributions to the understanding, prevention, and treatment of lung disease.” She will receive the award during the ATS Annual Meeting this May. Congratulations to Dr. Rabinovitch.
- **Heidi Heilemann**, Acting Director of the Lane Library, will be the recipient of the Murray Gottlieb Award from the Medical Library Association. Congratulations to Ms. Heilemann.
- **Dr. Paul Blumenthal**, Professor of Obstetrics and Gynecology, is this year's recipient of the Kenneth J. Ryan Award to be presented by the American College of Obstetricians and Gynecologists. This award acknowledges Dr. Blumenthal's impressive leadership and contributions to women's health. Congratulations to Dr. Blumenthal.

Appointments and Promotions

- **Laura D. Attardi** has been promoted to Associate Professor of Radiation Oncology and Genetics, effective 2/01/08.
- **Kerwyn C. Huang**, has been appointed to Assistant Professor of Bioengineering, effective 2/01/08.
- **David Relman** has been promoted to Professor of Medicine (Infectious Diseases) and of Microbiology & Immunology), effective 2/01/08.
- **Bryan D. Thom** has been promoted to Adjunct Clinical Associate Professor of Obstetrics and Gynecology, effective 3/01/08.

Dean's Newsletter March 10, 2008

Potential Changes in the NIH Peer Review System

In the November 5, 2007 issue of Dean's Newsletter I described some of the changes being discussed to “improve” the current NIH Peer Review system. The NIH now has a draft summary of potential recommendations and is seeking comments from grantees, academic medical centers and the community. We have been asked to submit responses by March 17th. You can offer your comments independently, although I think that a Stanford institutional response that encompasses our broad constituency would be more powerful. You can review the [recommendations from the NIH](#), and I am taking the liberty of including the Executive Summary below to enable you to become familiar with the positions the NIH might take. Given the current funding climate, these

recommendations take on even greater importance. Please feel free to offer your comments and reactions to me directly or to Dr. Ann Arvin, Vice Provost and Dean for Research by March 14th.

In conducting this self-study and related recommendations, the NIH recognizes that “it is critical that the NIH maintain the core values of peer review: scientific competence, fairness, timeliness, and integrity.” In this process some seven “challenges” were identified and developed, with input from investigators around the country, and each now has goals and recommendations associated with them. They include the following:

Challenge 1: Reducing Administrative Burden on Applicants, Reviewers, and NIH Staff. For many investigators, staying funded is a time- and labor-intensive exercise that can compromise the practice of research.

Goal: To reduce the number of applications that need to be submitted by helping applicants make faster, more informed decisions to either refine an existing application or develop a new idea.

Recommended Action (as of February 29, 2008): Provide unambiguous feedback to all applicants by establishing a “Not Recommended for Resubmission” (NRR) category and by providing scores for all applications.

Goal: To focus on the merit of the science presented in the application and not the potential improvements that may be realized following additional rounds of review.

Recommended Actions:

- *Eliminate the “special status” of amended applications by considering all applications as being new.*
- *Shorten summary statements by focusing solely on the merit of the science as presented.*

Goal: To reduce application length to focus on impact and uniqueness/originality, placing less emphasis on standard methodological details.

Recommended Action: Shorten the length of the application and align it to specific review elements.

Challenge 2: Enhancing the Rating System. The rating system that informs NIH peer review is central to every activity, and thus it is critical that the NIH carefully consider ways to ensure that rating is both as accurate and as informational as possible for both applicants and the NIH.

Goals: To focus and elevate the level of discourse of the study section, provide unambiguous feedback to applicants and enhance the consistency of rating, and to engage all charter review members in the review of each application.

Recommended Actions:

- *Modify the rating system to include scores and ranking.*
- *Rate multiple, explicit criteria individually, but provide an independent overall score and ranking.*
- *Provide unambiguous feedback to all applicants by establishing a “Not Recommended for Resubmission” category and by providing scores for all applications.*
- *Restructure the application to reflect the rating criteria.*

Challenge 3: Enhancing Review and Reviewer Quality. The cornerstone to review quality is recruiting and retaining excellent reviewers. Thus, improving review quality means addressing the larger problem of changing the culture of review.

Goal: *To enhance review quantity.*

Recommended Actions (as of February 29, 2008):

- *Engage more reviewers per application.*
- *Pilot the use of “prebuttals” for applicants and/or reviewers to correct factual errors in review.*
- *Pilot anonymous review in the context of a two-level review system.*
- *Enhance reviewer, study section, and scientific review officer training.*

Goal: *To enhance reviewer quality.*

Recommended Actions:

- *Create incentives for reviewers, including more flexible service and flexible deadlines for reviewer grant submissions.*
- *Link potential review service to the most prestigious NIH awards.*
- *Analyze patterns of participation by clinician scientists in peer review and provide more flexibility to ensure their continued involvement in review.*
- *Continue piloting the use of patients and/or their advocates in clinical research review.*

Goal: *To ensure the best use of charter review member time and expertise.*

Recommended Actions:

- *Shorten application and summary statement length.*
- *Have charter review members explicitly rank applications.*

Challenge 4: Optimizing Support for Different Career Stages and Types. As previously noted, supporting early-career investigators emerged as a top challenge during the diagnostic phase of the 2007-2008 peer review self-study, and it has been the top priority of the NIH leadership for many years. However, there is also a need to enable greater productivity of highly accomplished NIH investigators, with less administrative burden to applicants and reviewers.

Goal: Early-career investigators should at a minimum be on par with established principal investigators in application success rates.

Recommended Actions:

- *Continue to fund more R01s for early-career investigators.*
- *Pilot the ranking of early-career investigators against each other.*
- *Pilot the review of early-career investigators separately by generalists, to enhance risk-taking and innovation or uniqueness by applicants.*
- *Take into account investigator/institutional commitment criteria for early-career investigator review.*

Goal: To enable greater productivity of highly accomplished NIH investigators, with less administrative burden to applicants and reviewers.

Recommended Action (as of February 29, 2008): *Refine the NIH MERIT/Javits/NIH Director's Pioneer Awards and, perhaps, other mechanisms to enhance productivity of the most accomplished investigators and to add to the pool of accomplished investigators available as potential reviewers.*

Challenge 5: Optimizing Support for Different Types and Approaches of Science. Diverse types of science are needed to fulfill the NIH's mission to improve the nation's health, and peer review must accommodate the NIH's need to strike an appropriate balance among these.

Goal: To provide clear opportunities for applications proposing transformative research.

Recommended Action: *Use the NIH Director's Pioneer, NIH Director's New Innovator, and the Exceptional, Unconventional Research Enabling Knowledge Acceleration (EUREKA) Award programs as starting points to develop a path to invite, identify, and support transformative research, expanding the number of*

awards to a minimum of 1 percent of all R01-like awards.

Goal: *To ensure optimal review of clinical research.*

Recommended Action: *Determine the underlying causes of clinical research application submission patterns and results in the Center for Scientific Review (CSR) and NIH Institute and Center (IC) panels and consider corrective actions if needed. Ensure participation of adequate numbers of clinician scientists by providing more flexible options for review service.*

Goal: *To ensure optimal review and support for interdisciplinary research.*

Recommended Actions:

- *Analyze applications that are interdisciplinary in nature with respect to referral patterns for review, assignment for secondary review and funding consideration, and success rate.*
- *Employ an editorial board model for the review of interdisciplinary research.*

Challenge 6: Reducing the Stress on the Support System of Science.

Regardless of the numerous and complex issues that stress the system used to support U.S. biomedical and behavioral research, resources will always be finite in nature. The NIH must continue to guide the distribution of these resources through careful and transparent prioritization in concert with the NIH's stakeholders.

Goal: *To ensure the optimal use of NIH resources.*

Recommended Actions:

- *Require, in general, a minimum percent effort for investigators on research project grants.*
- *Analyze the incentives inherent in the NIH system of funding that have been driving the rapid expansion of the U.S. biomedical research system in recent years and explore with stakeholders whether these incentives should be reduced or eliminated.*
- *Analyze the NIH contribution to the optimal biomedical workforce needs.*

Challenge 7: Meeting the Need for Continuous Review of Peer Review. The NIH needs to establish data-driven mechanisms to evaluate review outcomes and to assess the success of pilot programs. This effort must be highly dynamic, to match concurrent changing landscape of biomedicine.

Goal: To assure the core values of peer review

Recommended Actions:

- ***Mandate a periodic, data-driven, NIH-wide assessment of the peer review process.***
- ***Capture appropriate current baseline data and develop new metrics to track key elements of the peer review system.***

While some of these recommendations are overlapping, and while a number represent enhancements to the current review process, others are potentially problematic – depending on the details behind them. Again, we are interested in your input on the current goals and recommended actions. Please let us know your thoughts or reactions.

Remember to Vote

First the disclaimer: the Dean's Newsletter will not be endorsing any specific candidate! Second, this is not about the Presidential Primaries or the pending national election – although as you might imagine, I have some strong views about the process underway and the consequences for our nation based on who is elected as our next President. Rather, this message is more local and is focused on the Stanford Medical Center, albeit with serious consequences for both Stanford Hospital & Clinics and the School of Medicine.

Beginning today, March 10th, all members of the SHC Medical Staff (which includes faculty and community physicians) will receive instructions by email on how to vote for the Chief of Staff of the SHC Medical Staff. This is a serious and important election since the authority and role of the Chief of Staff position has been significantly changed by the recently passed Medical Staff By-Laws. Indeed the Chief of Staff will become a member of the SHC Board of Directors and will have significant power and authority over issues affecting not only physicians who admit patients to SHC, but also hospital functions and clinical departments.

The election process that begins today will select both the next Chief of Staff and the Vice Chief of Staff. Each will serve sequential two-year terms (the Vice Chief of Staff will also become the Chief of Staff in two years). Thus the leadership of the SHC Medical Staff for the next 4 years will be determined through this election. This is a period of tremendous change at SHC, and it is critical that the Medical Staff leadership be equipped to deal with the challenges that will impact the future of the medical center, the faculty and the community.

In the past, voting for the Medical Staff leadership has been lax and inattentive – in fact only about 10% of the medical staff voted in the past election. But that pattern should not be sustained. ***I strongly encourage each member of the SHC medical staff to review the candidate roster carefully and to vote. It is extremely important that you take this seriously.***

Leading Matters and the Stanford Challenge

On Saturday, March 7th I had the opportunity to participate in the second national appearance of “*Leading Matters*,” which was held at the San Diego Convention Center. The inaugural event had taken place in Seattle, Washington in February. This is all part of a national and international agenda led by President John Hennessy to reconnect Stanford to alumni, parents and communities across the nation and around the world. It was a fantastic event and I felt very proud to be part of the Stanford community.

Leading Matters included presentations, discussions, and networking along with some incredible audiovisual documentaries that review Stanford history, some of its current activities and, most importantly, its future leadership and direction among universities. These were highlighted in discussions led by students from across the university. The medical school was well represented by Tress Goodwin, SMS 4, who participated in a panel discussion with President Hennessy in San Diego, and Cheri Blauwet, SMS 5, who was featured in the documentary extravaganza that closed the dinner event of the San Diego *Leading Matters*.

Three exciting panels and faculty seminars comprised the heart of *Leading Matters*. The topics were diverse and important and featured the three major themes of the Stanford Challenge: the Initiatives on Human Health and on Energy and the Environment and the International Initiative. I had the opportunity to moderate a panel entitled *Frontiers of the Future: Our Brain and Behavior*, which drew hundreds of people to a discussion that reviewed some of the exciting insights emerging from Stanford’s Neuroscience Institute and related initiatives. The Neuroscience Institute at Stanford embraces the entire university and was well reflected in the panel members, which included: Carla Shatz, Director of Bio-X and Professor of Biological Sciences and of Neurobiology; Brain Wandell, Isaac and Madeline Stein Family Professor and Chair of Psychology and, by courtesy, of Electrical Engineering and Radiology; and Hank Greely, Deane and Kate Edelman Johnson Professor of Law and, by courtesy, Professor of Genetics.

The panel focused on the dipole of “nature vs. nurture” from the molecular, systems, imaging and ethical, legal and societal perspectives. It was an engaging dialogue and seemed to be quite well received. Importantly, it conveyed what makes Stanford so distinctive: a commitment to discover, innovate and engage in “out of the box” thinking that draws on the expertise and knowledge of different disciplines, seeks to find solutions to complex problems and, in doing so, helps improve the world we live in.

I also joined Dr. Lucy Tompkins, the Lucy Becker Professor of Medicine and Professor of Microbiology and Immunology, in a faculty seminar on *Global Health: Infection, Disease and Society*. This panel, which also drew hundreds of participants, conveyed the foundations and relevance of infectious diseases in the USA and on the world stage. We reviewed the advances that have occurred in preventing and treating infectious diseases along with the challenges now appearing with resistance to immunization and the emergence of antibiotic resistant microorganisms. Importantly, we also put the challenge

of infectious diseases in a global context – which has become ever more important in the modern world of globalization and travel.

We certainly recognize the enormous challenges we face today as our national and global economy deteriorates as well as the many looming issues affecting academic medical centers now and into the future. But stepping back and viewing the incredible contributions Stanford has made over the decades and is poised to continue to make in the 21st Century should make us all proud to be members of the Stanford community.

Update on the Department of Structural Biology

On Friday, March 6th, Dr. Jodi Puglisi, Professor and Chair of the Department of Structural Biology, gave a thoughtful and informative update to the Executive Committee on the past, present and future accomplishments and opportunities he envisioned. A brief summary of his presentation is captured in the following update he provided for inclusion in the Dean's Newsletter.

The Department of Structural Biology was founded in the 1970s by Roger Kornberg and Lubert Stryer. It was the first Department of Structural Biology in the world, and merged a desire to modernize anatomy with nascent need to bring molecular structural studies to Stanford. Despite Stanford's obvious strengths in biochemistry and physical sciences, structural biology was virtually nonexistent at Stanford through the 1960s and 1970s (Oleg Jardetzky's pioneering NMR work was an exception). With the founding of the Department, the germline of the current department was set. Roger Kornberg was able to raise money from the Beckman foundation, and recruited the first structural biologists in the early 1990s. Since then, the department has grown to 7.5 UTL faculty, and 4 Courtesy Faculty. The Department includes 3 members of the National Academy of Sciences, 2 members of the Royal Society and the 2006 Nobel Laureate in Chemistry, Roger Kornberg. The collection of structural biologists at Stanford is arguably the best in the world.

Structural biology uses the principles of chemistry and physics to understand how the three-dimensional structures of biological molecules determine their function. The field has an illustrious history that includes many of the giants of 20th century science, including Pauling, Perutz, Bernal, Watson, Crick, Wilkens and others. These pioneers combined a deep understanding of physics and chemistry, an appreciation for careful experimentation, with an understanding of biology and the long-term dedication to solve groundbreaking problems. The echo of the approach resonates through the current Department of Structural Biology. Our department is driven by a desire to solve deep biological mysteries such as immune recognition, transcription, translation, protein folding, transport and viral infections using the techniques of structural biology: x-ray crystallography, nuclear magnetic resonance spectroscopy, cryoelectron microscopy, computational approaches and single molecule methods. The instrumentation infrastructure at Stanford is unsurpassed, and available to the general research community. The Stanford Synchrotron Radiation Laboratory (SSRL) provides onsite x-

ray radiation for crystallographic studies, the Stanford Magnetic Resonance Laboratory (SMRL) provides high-field solution and solid-state NMR needs for both the School of Medicine and beyond, and finally the cryoelectron microscopy core allows cellular and molecular imaging. The Clark center houses an extremely powerful cluster for high-speed computation. These facilities are jewels that power the structural biology research endeavor.

The department faculty research engages a variety of approaches and biological systems. X-ray crystallography is the workhorse for atomic-level structure determination. The Kornberg laboratory has used the deep mixture of biology and chemistry to unravel how the process of transcription in eukaryotic cells is performed by RNA polymerase machinery. His laboratory is pushing the envelope of complex structural biology, employing x-ray crystallography as well as new imaging approaches using cryoelectron microscopy. The Weis group uses x-ray structural studies coupled with highly collaborative biochemical investigations to probe how cell-cell contacts are formed, how vesicles fuse and how developmental signals are communicated. Recently his group worked with that of Brian Kobilka to solve the first structure of a G-protein coupled receptor (GPCR) bound to a drug. GPCRs represent 40% of targets of current therapeutics, so this structure is a landmark. The McKay group studies a variety of proteins that manipulate the structures of other proteins or nucleic acids. The function of these chaperones is key to many cellular processes. The Garcia group studies protein complexes involving cell surface receptors in immunology and signaling. These landmark studies have provided the structural basis for T-cell-MHC recognition as well as cytokine signaling. The Jardetzky group studies how viruses cross cellular membranes and uncoat. Large-scale conformational changes of the proteins drive these remarkable processes. The Brunger group uses structural and single molecule approaches to investigate synaptic vesicle fusion. Stanford has assembled a truly unique group of x-ray crystallographers.

The Department applies methods beyond x-ray crystallography to understand function. Computation is essential to understand the behavior of complex systems. The Levitt group pioneered computational applications to biology, and investigates fundamental aspects of molecular interactions that drive bimolecular structure formation. He is also developing new methods to understand dynamics of biological systems both small and large. The Pande group has developed novel computational approaches to investigate dynamics in biological systems, and he is applying them to a wide range of problems including protein folding and misfolding as well as drug design. The Parham group studies the immunology of natural killer cells and their underlying genetic diversity. The Puglisi group uses NMR, single molecule spectroscopy and crystallography to understand the correlation of structure, dynamics and mechanism in RNA-protein assemblies such as the ribosome. The McMahon group uses cryoelectron microscopy to study synapse formation. The Bryant group manipulates molecular motors using single-molecule methods. Structural biologists are moving to animate molecular movies and investigate larger systems using new approaches.

Built on this spectacular scientific foundation, the department faces challenges and opportunities for the future. Space and aging instrumentation are limitations to our current work and future growth. We must hire more junior faculty, as all but one faculty is a full Professor. We must increase the diversity of our faculty as well. Despite these challenges, structural biology will continue to be the cornerstone of molecular biology, and the crossroads where chemistry, physics, biology and medicine converge. The construction of the x-ray laser at SLAC promises to revolutionize structural studies. New approaches will probe the dynamics of molecular systems, and allow investigation of larger biological assemblies. As our knowledge base grows and computer power increases, computation will become even more central to our activities. Our faculty will continue to mix novel technical approaches with deep appreciation for biological function. Education of our next generation of biophysicists and structural biologists, currently through our own graduate program and the Biophysics program, will continue to emphasize rigor and theoretical understanding. The future of structural biology at Stanford is bright indeed.

Launch of the Helen and Peter Bing Core Competency Lecture Series

On Wednesday evening, February 27th, the Helen and Peter Bing Core Competency Lecture series was launched “to introduce professional, ethical, and practice-based issues facing future medical practitioners, and offer viable alternatives for their resolutions and models for discussion.” I had the opportunity to participate in this first event, which focused on “*Conflict of Interest (COI) in Professional Practice*.” I was joined by David Magnus, Professor of Pediatrics and Director of the Center for Biomedical Ethics, and John Adler, Dorothy and TK Chan Professor of Neurosurgery. The goal of this session was to help residents and trainees understand the broader issues impacting conflict of interest as well as to become more familiar with Stanford’s COI policies for research, education and patient care.

I have written frequently about this topic in the Dean’s Newsletter because of its overall importance and also because of the rapidly escalating scrutiny being focused on it at this time. To that regard it is noteworthy that the President of the Senate in the Commonwealth of Massachusetts introduced legislation this past week banning all gifts and perks to doctors from drug companies. In fact, the proposed legislation would invoke a \$5000 fine and/or two years of imprisonment for anyone who violated the ban. Independent of this, it is also important to note that we have received a query from the Inspector General’s Office of the Department of Health and Human Services (along with more than 40 other academic medical centers) about how our COI policies are monitored at Stanford, especially in reference to faculty receiving grant support from the National Institutes of Health. The bottom line is that the issue of COI is achieving local as well as national attention, and it seems quite probable that the guidelines applicable to physicians and to academic medical centers and universities are likely to become more stringent and legislated in the not too distant future. All the more reason for our community to become more aware and educated about COI, making the relevance of this new Core Competence program all the more important.

I also want to remind faculty that it is time to submit your annual COI disclosures, which can be done on-line. Stanford's COI policies are available to review online.

Donor Appreciation

Each year we have the opportunity to thank the wonderful individuals, families and foundations that have contributed to medical education. At the Annual Donor Appreciation dinner we also have the opportunity to pair those who have contributed to education with the students who have been the beneficiaries of this generosity. This invariably makes for a wonderful and festive evening – especially because of the renewed bonding that emerges between those who have given and those who have received this incredible support. Sadly, the level of indebtedness of students graduating from medical school continues to rise (72 students of the 2008 graduating class carry an average debt burden of \$85,879.00). Unfortunately, such debt not infrequently impacts the career plans and directions of medical school graduates – something that is thankfully more limited at Stanford than at other medical schools where the debt burden on graduates is greater.

One of the highlights of this annual event is hearing from students who reflect on their personal journey and how financial aid has impacted their lives and career choices. I feel confident that the stories of any one of our students would be compelling, but time permits us to only feature three students at the Donor Appreciation Dinner. And, as expected, each presented a moving and thoughtful account of the challenges she faced in pursuing a career in medicine and science – and how financial support from our donors and Stanford helped them achieve success. This years student speakers included Adeoti Oshinowo, SMS 4, Dora Castaneda, SMS 5 and Charay Jennings, PhD, SMS 9. I want to thank each for the efforts they put into making the event so meaningful.

Stanford Menlo Park Open House

Late last year a number of important administrative units moved to our off-site facility at SRI in Menlo Park. These included Fiscal Affairs, Facilities Planning and Management, Institutional Planning, Human Resources, Information Resources, SPCTRM, and Communications and Public Affairs. An open house was held on Friday, March 7th to show off their new facilities – and the wonderful artwork and photography contributed by staff working at SMP site. I recognize that this has been a big transition for the 200 staff and that many still feel somewhat dislocated from the University campus. But most everyone I spoke with at the Open House was happy with their new space and readily acknowledged that their transition was made smooth and comfortable thanks to the leadership and committed efforts of Julia Tussing and Linda Gibson. I want to thank them in particular for making the move so successful and for enabling our colleagues at SMP to remain very much part of our Stanford Medicine community.

Centennial Update

In previous Dean's Newsletters

(http://deansnewsletter.stanford.edu/archive/01_28_08.html#8 and http://deansnewsletter.stanford.edu/archive/02_25_08.html#3) I have let you know about

the activities we are engaged in to celebrate the Centennial of the Stanford School of Medicine. By now I hope you have seen the banners that have appeared around our campus, which provide a visual reminder of our hundred-year history. The new highlight on the [Centennial website](#) is [women in medicine](#), and I encourage you to take a few moments to read about this vital aspect of our past as well as to learn about the current status, activities and opportunities for women in science and medicine. On Wednesday, March 12 at 2:00 p.m., Drew Bourn, Historical Curator at the Lane Library, will lead a School of Medicine Architectural Walking Tour. This is an excellent opportunity to learn about the history of our campus and to look ahead at the physical transformations that are underway for the future. For more information, contact Drew at dbourn@stanford.edu or 725-8045.

Finally, mark your calendars for two upcoming events. On April 3rd, at 5:00 p.m. in the Clark Center Auditorium, the Arts, Humanities and Medicine Program and the Center for Biomedical Ethics will be sponsoring a [Writer's Forum](#). This is one of the events that has been designated a Centennial event, and all are invited. And on April 23rd, 11:30-1:30 on the Dean's Lawn, we will have our All-School Centennial Lunch Celebration. Everyone – faculty, staff, and students – is invited to share in this coming together of our entire community, and I hope you will be able to attend.

Awards and Honors

Dr. Robert Carlson, Professor of Medicine has been selected to receive one of the National Physician of the Year Awards 2008 by Castle Connolly and is being honored with a dinner in New York City on March 18, 2008. Congratulations to Dr. Carlson.

2008 Paul & Daisy Soros Fellows. We have just learned that Stanford is again the recipient of five new Soros Fellowship awards “designed to assist immigrants and their children prepare for opportunities for leadership in their various fields in the United States.” Thirty new awards were announced, and five currently enrolled or soon to be enrolled Stanford medical students are the recipients of a 2008 Fellowship Award. Each awardee receives two years of one-half of the tuition support of their graduate study (up to \$16,000) as well as a maintenance grant of \$20,000 per year. This year's recipients include:

- ***Agnieszka Czechowicz*** - born in Gdansk, Poland and currently an SMS 2
- ***Sudeb Dalai*** - born in Marshall, MO (his parents came to the USA from a small village in India) and an MD/PhD student and Howard Hughes Fellow at Stanford.
- ***Elsie Gyang*** - born in Ibadan, Nigeria and currently an SMS 2
- ***Paul Nuyujukian*** - born in Houston TX (his parents are of Armenian heritage and were born and raised in Syria) and currently an MD/PhD student at Stanford University
- ***Krishnan Subrahmanian*** - born in St. Paul, MN (his parents came to the USA from Kerala, India) and will matriculate at Stanford in 2008.

Please join me in congratulating these 2008 Soros Fellows. This year's Fellows were selected from 700 applicants from 257 undergraduate and 123 graduate institutions. Since 1997 some 293 Fellowships have been awarded – 25 of who have been or are Stanford Medical Students.

Cecil Benitez, graduate student in Developmental Biology, has been selected as the 2008 Baxter Fellow in the Biosciences. She was selected following a call for nominations from each Home PhD Program in the School of Medicine and review by a committee of faculty members from Structural Biology, Immunology, Biochemistry, Neurosciences and Developmental Biology. Congratulations to Ms. Benitez.

Dr. Clarence Braddock, Associate Professor of Medicine has just been elected to the American Board of Internal Medicine (ABIM) Board of Directors; he has also received the “Outstanding Clinician Educator” award from the Society of General Internal Medicine California Region. Congratulations Dr. Braddock.

Appointments and Promotions

- ***Anne Brunet*** has been reappointed to Assistant Professor of Genetics, effective 4/01/08.
- ***Marion S. Buckwalter*** has been appointed to Assistant Professor of Neurology and Neurological Sciences, and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 2/01/08.
- ***Ching-Pin Chang*** has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine), effective 3/01/08.
- ***Hanlee Ji*** has been appointed to Assistant Professor of Medicine (Oncology), effective 3/01/08.
- ***Allison W. Kurian*** has been appointed to Assistant Professor of Medicine (Oncology) and of Health Research and Policy at the Stanford University Medical Center, effective 2/01/08.
- ***Lewis M. Shin*** has been appointed to Assistant Professor of Radiology at the Veterans Affairs Palo Alto Health Care System, effective 2/01/08.
- ***Thomas C. Südhof*** has been appointed to Professor of Molecular and Cellular Physiology and in the Neuroscience Institute, effective 3/01/08.

Dean's Newsletter

March 24, 2008

The 2008 Match: An Excellent Year

Thursday, March 20th was National Residency Match Day. While a few specialties completed their match weeks earlier, the vast majority of graduating medical students and residency programs received their “match results” at the same time - synchronized to 1 PM Eastern Standard Time on March 20th. This year 90 Stanford students had submitted a rank ordered list to the National Residency Match Program (NMRP). At 10 AM on Thursday a highly energized group gathered in the Dean's courtyard. Classmates, friends and many parents joined the graduating students as they waited to learn the results of their own “match,” which will define the next step in their life journey. It was an exiting time – and one filled with much joy and happiness as 93% of our students “matched” to one of their top three choices (compared to the national average of 84.6%).

This year, 15,242 graduates of allopathic medical schools applied for one of 22,240 first year residency positions. Also in the applicant pool were 10,300 graduates of non-USA medical schools and 1900 graduates of osteopathic schools. In this competition, Stanford students fared particularly well, matching in top residency programs across the USA – although nearly 60% of the class will be at Stanford (30 students), at Harvard programs (14 students) or at UCSF (8 students). As in prior years, approximately 60% of the graduating students have been at Stanford for 5 or more years. This year also featured 6 couples matching as a couple – all successful.

This year's most popular residency choices included pediatrics (12 students), internal medicine (11 students), anesthesia (10 students), emergency medicine (6 students), and radiology (6 students). While only 4 students are pursuing general surgery, 16 students matched in various surgical specialties.

From my perspective, all the students did splendidly and have much to be proud of. I offer each of them my congratulations. I hope that this relates, in part, to the impact of the New Stanford Curriculum, which began in the Fall of 2003, along with the improved evaluation process of our students (although this is still a work in progress). Accordingly, I also want to thank the faculty who supported the students, the Scholarly Concentration and research mentors who guided them, and our outstanding Faculty Advising Deans (Drs. Neil Gesundheit, Terry Blaschke, Susan Knox and Oscar Salvatierra), who played a key role in advising and mentoring our students during the application process. Thanks to all.

The results of the 2008 Stanford Medical School Residency Match follow:

<i>Graduating Student</i>	<i>Program Matched</i>	<i>Discipline</i>
<i>Adams, Mark Christopher</i>	Brigham & Womens Hosp-MA	Medicine-Preliminary

	Massachusetts Gen Hosp-MA	Anesthesiology
<i>Allee, Tina Marie</i>	UC Irvine Med Ctr-CA	Psychiatry
<i>Ananth, Prasanna Janaki</i>	Childrens Hosp Boston-MA	Pediatrics
<i>Bazan, Jose Gilberto</i>	Kaiser Perm-Santa Clara-CA	Medicine-Preliminary
	Stanford Univ Progs-CA	Radiation Oncology
<i>Bendapudi, Pavan Kasi</i>	Massachusetts Gen Hosp-MA	Internal Medicine
<i>Boas, Franz Edward</i>	Stanford Univ Progs-CA	Surgery-Preliminary
	Stanford Univ Progs-CA	Radiology-Diagnostic
<i>Bower, Regina Sheree</i>	Mayo Clinic Rochester-MN	Neurological Surgery
<i>Bradford, Catharine Hunter</i>	UC San Francisco-CA	Plastic Surgery
<i>Bragg, William Edward</i>	Stanford Univ Progs-CA	Orthopaedic Surgery
<i>Brat, Gabriel</i>	Johns Hopkins Hosp-MD	General Surgery
<i>Brown, Nicole Marie</i>	Johns Hopkins Hosp-MD	Pediatrics
<i>Bucknor, Matthew</i>	Kaiser Permanente-SF-CA	Medicine-Preliminary
	UC San Francisco-CA	Radiology-Diagnostic
<i>Burke, Robert</i>	Brigham & Womens Hosp-MA	Medicine-Primary Care
<i>Carre, Susan Marie</i>	O'Connor Hospital-CA	Family Medicine
<i>Caruso, Thomas Jon</i>	Kaiser Perm-Santa Clara-CA	Medicine-Preliminary
	Massachusetts Gen Hosp	Anesthesiology
<i>Castaneda, Dora Cristina</i>	Santa Clara Valley MC-CA	Medicine-Preliminary
	Stanford Univ Progs-CA	Anesthesiology
<i>Chan, Steven Man Cheong</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Chang, Bernard P.</i>	Brigham & Womens Hosp-MA	Emergency Medicine
<i>Cochran, Lauren Wiltshire</i>	NYP Hosp-Weill Cornell-NY	Pediatrics
<i>Craven, Matthew T.</i>	Brigham & Womens Hosp-MA	Internal Medicine
<i>Curran, Emily Kathleen</i>	Univ of Chicago Med Ctr-IL	Internal Medicine
<i>Dearlove, Joanna Victoria</i>	White Mem Med Ctr-LA-CA	Medicine-Preliminary
	UCLA Medical Center-CA	Neurology
<i>DeCaro, John Joseph</i>	Emory Univ SOM-GA	Urology
<i>Delasobera, Bronson Elizabeth</i>	Washington Hosp Ctr-DC	Emergency Medicine
<i>Desai, Rajen Uday</i>	Maimonides Med Ctr-NY	Transitional
<i>Dewey, Frederick Edward</i>	Stanford Univ Progs-CA	Internal Medicine

<i>Diaz, Rosa Lorenia</i>	UC San Francisco-CA	Obstetrics-Gynecology
<i>Duan, Melissa Ellen</i>	Brigham & Womens Hosp-MA	Medicine-Preliminary
	Massachusetts Gen Hosp-MA	Anesthesiology
<i>Englander, Miriam</i>	New York Downtown Hosp-NY	Medicine-Preliminary
	Mass Eye & Ear Infirmary-MA	Ophthalmology
<i>Gholami, Sepideh</i>	Stanford Univ Progs-CA	General Surgery
<i>Goodwin, Tress</i>	Washington Hosp Ctr-DC	Emergency Medicine
<i>Hagedorn, Judith Carolin</i>	Stanford Univ Progs-CA	Urology
<i>Heit, Jeremy Josef</i>	Brigham & Womens Hosp-MA	Medicine-Preliminary
	Massachusetts Gen Hosp-MA	Radiology-Diagnostic
<i>Hoehn, Benjamin Douglass</i>	University of Virginia-VA	Neurological Surgery
<i>Huang, Lyen Camille</i>	Stanford Univ Progs-CA	General Surgery
<i>Hunt, Stephen James</i>	Kaiser Permanente-SF-CA	Medicine-Preliminary
	Hosp of the Univ of PA	Radiology-Diagnostic
<i>Jazayeri, Lila</i>	Stanford Univ Progs-CA	Plastic Surgery
<i>Jennings, Charay</i>	Stanford Univ Progs-CA	Pathology
<i>Juul, Sarah Hecquet</i>	Emory Univ SOM-GA	Psychiatry
<i>Kaufman, Jenya Alissa</i>	UC San Francisco-CA	Psychiatry
<i>Kaur, Kirandeep</i>	Santa Clara Valley MC-CA	Transitional
	Stanford Univ Progs-CA	Ophthalmology
<i>Kea, Bory</i>	UC San Francisco-CA	Emergency Medicine
<i>Keegan, Hugh Lawrence</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Kim, Hanna Y.</i>	Memorial Sloan-Kettering-NY	Transitional
	UC Los Angeles-CA	Ophthalmology
<i>Kim, Rebecca Yoonjung</i>	Stanford Univ Progs-CA	General Surgery
<i>Komorowski, Leanne</i>	U New Mexico SOM-NM	Obstetrics-Gynecology
<i>Krodel, David James</i>	CA Pacific Med Center-CA	Medicine-Preliminary
	Massachusetts Gen Hosp-MA	Anesthesiology
<i>Kurien, Philip Abraham</i>	Santa Clara Valley MC-CA	Transitional
	UC San Francisco-CA	Anesthesiology
<i>Lee, Lucy Chu</i>	Stanford Univ Progs-CA	Pediatrics
<i>Liau, Jason A.</i>	Johns Hopkins Hosp-MD	Neurological Surgery

<i>Loening, Andreas Markus</i>	University of Hawaii-HI	Transitional
	Stanford Univ Progs-CA	Radiology-Diagnostic
<i>Lorenzo, Javier</i>	Kaiser Permanente-SF-CA	Medicine-Preliminary
	Stanford Univ Progs-CA	Anesthesiology
<i>Marquez, Celine</i>	Yale-New Haven Hosp-CT	Medicine-Preliminary
	CA Pacific Med Center	Radiation Oncology
<i>Maxwell, Bryan Geoffrey</i>	Stanford Univ Progs-CA	Transitional
	Stanford Univ Progs-CA	Anesthesiology
<i>Meyer, Everett Hurteau</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Molina, Michael Daniel</i>	Sutter Health-CA	Family Med/Sacramento
<i>Mong, Cindy</i>	UCLA Medical Center-CA	Internal Medicine
<i>Muzumdar, Mandar Deepak</i>	Brigham & Womens Hosp-MA	Internal Medicine
<i>Nangiana, Jasvinder Singh</i>	Mayo Clinic Rochester-MN	Neurological Surgery
<i>Nelson, Ehren Robert</i>	White Mem Med Ctr-LA-CA	Medicine-Preliminary
	Brigham & Womens Hosp-MA	Anesthesiology
<i>Nguyen, Bichchau Thi</i>	Stanford Univ Progs-CA	Medicine-Preliminary
	UC San Diego Med Ctr-CA	Dermatology
<i>Ortiz, Steven Gilbert</i>	Stony Brook Teach Hosps-NY	Orthopaedic Surgery
<i>Pettit, Kate Estelle</i>	Kaiser Permanente-SF-CA	Obstetrics-Gynecology
<i>Priest, James Rush</i>	U Washington Affil Hosps-WA	Pediatrics
<i>Ramsey, Meghan Claire</i>	Stanford Univ Progs-CA	Internal Medicine
<i>Richards, Christopher T.</i>	Northwestern McGaw-IL	Emergency Medicine
<i>Rivas, Eunice Valeria</i>	U Southern California-CA	Medicine-Pediatrics
<i>Rooholamini, Sahar N.</i>	Stanford Univ Progs-CA	Pediatrics
<i>Rosen, Lynne Novick</i>	Childrens Hosp-Oakland-CA	Pediatrics
<i>Rutman, Lori Ellen</i>	Stanford Univ Progs-CA	Pediatrics
<i>Sanchez, Maricela</i>	St Vincents Hospital-NY	Anesthesiology
<i>Sarin, Kavita Yang</i>	Santa Clara Valley MC-CA	Transitional
	Stanford Univ Progs-CA	Dermatology
<i>Silva, Ruwan Amila</i>	UC Irvine Med Ctr-CA	Medicine-Preliminary
	U Miami/Bascom Palmer-FL	Ophthalmology
<i>Smith, Geoffrey Bryant</i>	Univ of Chicago Med Ctr-IL	Int Med/MD Scientist

<i>Sundberg, Eric Borden</i>	Stanford Univ Progs-CA	Orthopaedic Surgery
<i>Tsao, Gabriel J.</i>	Stanford Univ Progs-CA	Otolaryngology
<i>Tversky, Dona Amos</i>	UC San Francisco-CA	Psychiatry
<i>Vaks, Yana</i>	Stanford Univ Progs-CA	Pediatrics
<i>Waipa, Jasmine K.</i>	Stanford Univ Progs-CA	Pediatrics
<i>Walker, Graham</i>	St Lukes-Roosevelt-NY	Emergency Medicine
<i>Wang, Ruobing</i>	Massachusetts Gen Hosp-MA	Pediatrics
<i>Wang, Yingbing</i>	Kaiser Perm-Santa Clara-CA	Medicine-Preliminary
	Massachusetts Gen Hosp-MA	Radiology-Diagnostic
<i>Wilson, Jenny</i>	Stanford Univ Progs-CA	Pediatrics
	Childrens Hosp-Philadelphia-PA	Child Neurology
<i>Wrede, Joanna Elaine</i>	U Washington Affil Hosps-WA	Pediatrics
	U Washington Affil Hosps-WA	Child Neurology
<i>Wrenn, Stephen Jarrett</i>	Kaiser Permanente-SF-CA	Medicine-Preliminary
	UC San Francisco-CA	Radiology-Diagnostic
<i>Yasnovsky, Jessica Rachel</i>	Stanford Univ Progs-CA	Pediatrics
<i>Zambrano, Gerardo Javier</i>	Stanford Univ Progs-CA	Psychiatry

In addition to outstanding Match Results for Stanford medical students, I am also pleased to say that each of the residency programs at Stanford Hospital and the Lucile Packard Children's Hospital also had outstanding success in recruiting students from Stanford as well as other outstanding medical centers across the US. I offer the residency programs – and all the new members of our Stanford Community – my welcome and congratulations.

National Advisory Council Reviews Integrated Planning

On Monday, March 17th, the School of Medicine's National Advisory Council (NAC) made its fifth consecutive annual visit to the School. At the Council's request, the topic this year focused on "Integrated Planning Across the School, Medical Center and University." We are fortunate to have this outstanding group of leaders in medicine and bioscience review the various strategic initiatives of the School and report their findings, observations and recommendations to the President and Provost.

The NAC is chaired by Dr. Ed Benz, President of the Dana Farber Cancer Institute/Harvard Medical School and includes Dr. Elizabeth Blackburn, Professor in the Department of Biochemistry & Biophysics, University of California, San Francisco; Dr. Thomas F. Boat, Professor and Chair, Department of Pediatrics at Children's Hospital Medical Center in Cincinnati; Ms. Mariann Byerwalter, MBA, Trustee, Stanford University; Dr. Ying-Ying Goh, Trustee, Stanford University; Dr. Jennifer Rubin, Vice

Chair of Research, Department of Otolaryngology, and Professor of Otolaryngology and Pharmacology, University of Pittsburgh School of Medicine; Dr. Daniel H. Lowenstein, Professor of Neurology, University of California, San Francisco; Dr. James Madara, Dean of the Division of Biological Sciences and the Pritzker School of Medicine and University Vice- President for Medical Affairs, The University of Chicago; Dr. David G. Nichols, Professor of Education and Vice Dean for Education, Professor, Anesthesiology and Critical Care Medicine, Johns Hopkins School of Medicine; Dr. William A. Peck, Professor of Medicine, Washington University; Dr. Arthur H. Rubenstein, MBBCh, Executive Vice President, University of Pennsylvania for the Health System, Dean, University of Pennsylvania School of Medicine; Dr. William W. Stead, Director of Informatics Center, Associate Vice Chancellor for Health Affairs, Vanderbilt University Medical Center; and Dr. Michael J. Zinner, Chair, Department of Surgery, and Professor of Surgery, Brigham and Women's Hospital, Harvard Medical School.

The theme for this year's NAC visit builds on the issues we have been grappling with over the past year. It was also the focus of our 2008 Strategic Planning Leadership Retreat on "Quality and Balance," the agenda and outcome of which can be reviewed at <http://medstrategicplan.stanford.edu/retreat08/>. I also previewed some of the important issues that frame our efforts in integrated planning in my January 14, 2008 Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/01_14_08.html#2).

As we celebrate the 100th Anniversary of the founding of Stanford University School of Medicine and anticipate commemorating, in 2009, the 50 years that the Medical School has been on the University campus, we have much to be grateful for. By any reckoning, Stanford University School of Medicine is internationally recognized as one of the most outstanding research-intensive medical schools in the world. But we must also be mindful that sustaining as well as enhancing excellence requires persistence, energy, creativity, focus, prioritization and resources. Without question, our success is directly related to our excellent faculty, students and staff. We are fortunate to have among the most talented individuals in the world at Stanford – but their efforts are now challenged by not insignificant resource constraints. This comes from external as well as internal forces and factors and, unfortunately, there has been a rapid convergence of challenging issues in the past few years that will require thoughtful planning as well as some luck to overcome.

One of the most notable external challenges, of course, is the downturn in research funding from the National Institutes of Health. The continuation of below inflation research support places a serious burden on faculty who are dependent on federally sponsored research grants and contracts to conduct basic as well as more applied research. This is further challenged by the tensions in healthcare funding – an issue that also seems destined to get worse before it gets better. And, of course, the recent months and days have brought increasingly distressing national and global economic news – which also impacts our ability to plan, construct, fund and support key initiatives, including our ability to develop philanthropic support from foundations and individuals for programs and projects in education, research and patient care.

Ironically, these downward pressures come at the very time when Stanford has been planning renewal or expansion of its physical facilities at the School as well as at Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH). This planned facilities expansion is being coupled with selective programmatic growth and development in research, education and patient care. Because related but discrete entities are involved - that is, the University, Medical School, SHC and LPCH - it is important that integrated and coordinated planning take place. Moreover, the fact that each entity has its own governance, resources and financial accountability poses an additional challenge. Further, the planning activities must take into account constraints imposed by local jurisdictions, including the Santa Clara County General Use Permit (or GUP) for University buildings (including the southern portion of the Medical School) and the City of Palo Alto for the Hospitals and the northern buildings (Grant, Alway, Lane and Edwards) of the Medical School. An added internal constraint comes from Provostial limitations on the size of the faculty, which is presently capped at 900 (as of this week we have 818 full-time faculty not including Clinician-Educators).

Within this context we presented to the NAC a comprehensive and integrated review of the planning work the School has been conducting within the Medical Center as well as in conjunction with the University. During their full-day visit we presented detailed forecasts, projects and models of how we plan for faculty growth and development, facility size and scope, funding from operations or borrowing and philanthropic growth. An important focus of attention was the nexus of integrated planning embracing the 10-20 year capital plans of the School and Hospitals (especially given the magnitude of plans for facilities on the Stanford campus and in the Bay Area). We also addressed important issues and accomplishments in the integrated planning for information technology, in our efforts to address research cores (and plan for future laboratory animal facilities and support), to foster innovation (through the SPARK program), and to support clinical and translation research (through the pending Clinical and Translational Science Award (CTSA)). Finally, we discussed our plans to develop new models to help support our investment and success in basic science and to develop and implement plans and approaches to improve the quality and value of our patient care programs. The NAC also had the pleasure of hearing the experiences of PhD students enrolled in the Masters in Medicine program as well as one of the first individuals to enroll in the Advanced Residency at Stanford (ARTS) program.

It was my impression that the NAC was very engaged as well as impressed by the depth and quality of the data and analyses we presented to them. Of course, as leaders in academic medicine, NAC members are fully cognizant of the major issues facing all centers, including the ones referred to earlier in this Newsletter. Not surprisingly, the NAC shared concerns about the feasibility of completing all of the projects envisioned on optimistic timelines - but also recognized the importance of what we are attempting to achieve and the highly integrated and coordinated planning efforts we have put into place. Clearly, finding the right balance in the size and scope of our programs - while maintaining and even enhancing excellence and quality - must be our overarching objective. Of course, we will need to await the final report of the NAC to benefit from

their critical analysis, comments and recommendations. Obviously more will follow on this topic.

Remembering Dr. Steven Leibel

On Wednesday, March 19th, hundreds of family, friends and colleagues gathered in the Arrillaga Alumni Center to remember, celebrate, commemorate and reflect on the life of Dr. Steven Leibel, who died unexpectedly on February 7th. Dr. Leibel was the Ann and John Doerr Medical Director of the Stanford Cancer Center and since joining the Stanford community in 2004 had played an important role in Stanford's success in becoming an NCI-designated Cancer Center. A world-renowned radiation oncologist, Dr. Leibel held leadership positions in a number of academic medical centers as well as national organizations and societies. Friends and colleagues traveled from Boston, New York and Washington DC to help commemorate his life. The Program included heart-felt comments from colleagues throughout Steve's career, including Dr. Richard Hoppe, the Henry Kaplan-Harry Lebeson Professor of Cancer Biology and Chair of the Department of Radiation Oncology at Stanford; Dr. Ted Phillips, Wun-Kon Fu Distinguished Professor of Radiation Oncology at UCSF; Dr. Zvi Fuks, Member at Memorial Sloan-Kettering Cancer Center; Dr. Richard Levy, Chairman of the Board, Varian Medical Systems; Martha Marsh, President and CEO at Stanford Hospital & Clinics; Dr. Bev Mitchell, Deputy Director, Stanford Cancer Center and George E. Becker Professor of Medicine; Dr. Sarah Donaldson, Catherine and Howard Avery Professor in Radiation Oncology at Stanford; Dr. Jay Harris, Chief, Department of Radiation Oncology at Harvard Medical School; and Dr. Alan Lichter, CEO, American Society of Clinical Oncology.

Each of the speakers addressed Dr. Leibel's many contributions to medicine, radiation oncology, policy, advocacy and leadership. Each speaker also reflected on Steve's friendship, loyalty, humanism, professionalism, compassion and sensitivity – each giving evidence of an individual deeply respected, loved, esteemed and whose memory will surely be enduring. He will be missed.

More Centennial Updates

I want to keep you apprised of the events we are planning to commemorate the School's 100th anniversary. As mentioned in the last Newsletter (<http://deansnewsletter.stanford.edu/#8>), we will be having a Celebration Lunch on Wednesday, April 23rd from 11:30 am – 1:30 pm at the Dean's Lawn. Be sure to reserve this date is on your calendar. Shuttle bus services will be available to and from our off-site locations. At the event we will be collecting items for a time capsule to be opened in 2108. Details to follow.

The Centennial website (<http://med.stanford.edu/centennial/>) has just been updated with new highlights including the story of Thomas Addis, a notable Stanford scientist whose work in nephrology during the first half of the twentieth century transformed the way doctors diagnosed patients. In addition there is an interesting look back on the history of

the Medical Linear Accelerator and a look forward to advances stem cells will bring to our future.

I also encourage you to attend the Writer's Forum, our first Centennial event. This unique event, sponsored by the Arts, Humanities & Medicine Program and the Stanford Center for Biomedical Ethics, will take place on Thursday, April 3rd at 5:00 pm at the Clark Auditorium. More information is available at:
<http://bioethics.stanford.edu/arts/documents/wf3.pdf>

Education-4-Care Program

Dr. Charles Prober, Senior Associate Dean for Medical Education and Dr. Lars Osterberg, Director, Educators-4-CARE Program, would like to send this message out to all faculty:

Dear Colleagues,

As you may know, we are instituting a new program within our medical education curriculum called "Educators-4-CARE" (Compassion, Advocacy, Responsibility and Empathy) which will be launched in September 2008. The program is being established to enhance the development of our medical students as skilled and compassionate physicians. We believe this will be a tremendous addition to our medical education program and a wonderful opportunity for interested faculty to be more engaged in the teaching of medical students.

We are seeking interested faculty to apply for the position of Educator in the Educators-4-CARE program. The deadline for applications is April 18, 2008. Please contact Lorena Najarro at lnajarro@stanford.edu for a position description and application. We thank you and hope to hear from those of you who are interested in this opportunity.

Upcoming Events

2nd Annual Tseng Lecture with Harold Varmus: *"Why Cancer Biology & Cancer Medicine Are Finally Merging"*

Wednesday, April 9

4:30 – 6:00 PM

Braun Auditorium, Mudd Chemistry Building, 333 Campus Drive

Dr. Harold E. Varmus, former NIH director and Nobel Prize winning scientist for the discovery of the cellular origin of retroviral oncogenes, as well as the current president of Memorial Sloan-Kettering Cancer Center, will be the honored speaker at the 2nd Annual Tseng Lecture on April 9th.

Skills Building Workshop: *"Negotiating"*

Thursday, April 17

5:30 – 8:30 pm
Always Building, M-112

The Office of Diversity & Leadership continues the Skills Building Workshop series with “*Negotiating*,” on April 17. Margaret A. Neale, Professor in the Graduate School of Business, will present information on negotiating and will moderate a highly interactive session covering some of the following topics: misconceptions of negotiating, barriers in social interaction, and costs of negotiating vs. not negotiating. The purpose of this workshop is to provide participants with a set of negotiation tools that can enhance the quality and rationality of their agreements.

Registration for this workshop is open to all faculty, including CE’s and Instructors. Please visit the ODL website at <http://med.stanford.edu/diversity/> for details on registration and location as well as other events offered by the Office of Diversity and Leadership.

Awards and Honors

- **Dr. Phil Beachy**, Ernest and Amelia Gallo Professor in the Stanford Institute for Stem Cell Biology and Regenerative Medicine and Department of Developmental Biology, has been named the 2008 recipient of the March of Dimes Prize for Developmental Biology. The co-winner is Dr. Cliff Tabin of Harvard Medical School. The award will be presented to Dr. Beachy in conjunction with the Pediatric Academic Society Meeting on April 7th. Please join me in congratulating Dr. Beachy for this highly distinguished honor.
- **Dr. Laurence Baker**, Professor of Health Science Research and Policy and, by courtesy, of Economics, has been awarded the Medal of the Association for the Study of Higher Education at its conference in June. Please join me in congratulating Dr. Baker for this honor.
- **Dr. Marilyn Winkleby**, Professor of Medicine and Faculty Director of the Office of Community Health, has been awarded the Judith Pool Award from the North CA Chapters of the Association for Women in Science (AWIS). Dr. Winkleby was named as the award winner because of her years of mentoring low-income high school students in the sciences, helping to break down barriers and create opportunities to ensure that women in the science, technology, engineering, and mathematics (STEM) fields can achieve their full potential. Please join me in congratulating Dr. Winkleby for this honor.

Appointments and Promotions

- **Kay W. Chang** has been promoted to Associate Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 3/01/08.

- **Andrew Connolly** has been promoted to Associate Professor of Pathology at the Stanford University Medical Center, effective 3/01/08.
- **Edward J. Bertaccini** has been reappointed to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 5/01/08.
- **Michael Fischbein** has been appointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 3/01/08.
- **Christina Kong** has been promoted to Associate Professor of Pathology at the Stanford University Medical Center, effective 3/01/08.
- **Peter G. Maxim** has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 3/01/08.
- **Josef Parvizi** has been appointed to Assistant Professor of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 3/01/08.
- **Sharon E. Williams** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Lucile Salter Packard Children's Hospital, effective 3/01/08.

Dean's Newsletter

April 7, 2008

Maintaining Relationships

On March 24th it was announced that Dr. Bryan Bohman has been elected Chief of Staff (COS) at Stanford Hospital & Clinics (SHC). Dr. Bohman received 53% of the 795 votes that were cast. For reference, all physician members of the medical staff, which includes faculty and community physicians, were eligible to vote. Excluding PhD and pediatric faculty, I estimate that approximately 680 faculty (including clinician-educators) were eligible to vote. Faculty comprise around half of the credentialed medical staff, although they care for approximately 75% of the patients admitted to SHC.

I offer my personal congratulations to Dr. Bohman and will certainly do all that I can to assist him in this important role and responsibility. For those who do not know him, Dr. Bohman is a community anesthesiologist; most recently he has served as the President of the Medical Staff. He played an important role in the revision of the SHC By-Laws that resulted in making the COS an elected rather than an appointed position (as has been the case until now) and in expanding the responsibilities of the COS, including appointment to the SHC Board of Directors.

While I am optimistic about the future, I do wish to share a concern. During the two week election period, there was considerable campaigning – which is good, since it heightened interest in the role of the medical staff. However, there were also a number of communications that tended to draw some sharp lines between the community and faculty physicians and that, to a degree, seemed to convey that the community doctors needed to unite to secure their leadership at SHC. I applaud the commitment of our community colleagues to SHC, but I am always distressed when communications become polarizing, as they sometime appeared to do in this election. Naturally we are all aware that elections can bring out the worst as well as the best among candidates and others involved in the process.

Of course I also recognize that there are considerable concerns about the future of SHC as it proceeds to a major renewal and rebuilding of its facilities in the years ahead. But I would hope that we would not devolve into the type of divided “town-gown” or community-faculty polarization that, unfortunately, has occurred at some points in the past. Accordingly, I call on each of us to do all that we can to maintain – and indeed improve – our relationships and interactions. With the state of health care as it is, and the many economic and professional challenges that stand before us, it is imperative that we work collaboratively and successfully on behalf of our patients, community, hospital and university.

In addition to the election of Dr. Bohman for the Chief of Staff, Dr. Geoff Rubin has been elected Vice Chief of Staff. He received 65% of the votes in a run-off election that concluded late last week. Under the terms of the revised By-Laws, the Vice Chief becomes the Chief of Staff in two years. Congratulations to Dr. Rubin. Now it is time to move on – with the goal of focusing on the goals of the entire medical center.

Laptops and Privacy

Laptop thefts are a risk to research subjects as well as patients. Todd Ferris, Associate CIO – IT Services, has prepared the following information on what needs to be done to combat this distressing trend.

Recently the NIH made a public announcement that a laptop theft exposed research subject information. The laptop was locked in a car trunk and was password protected; nevertheless, it was stolen and the research subjects' information is considered compromised. (Full NIH press release can be found at:

<http://public.nhlbi.nih.gov/newsroom/home/GetPressRelease.aspx?id=2559>)

Unfortunately, this is just the latest high-profile laptop theft that has exposed sensitive information on patients, research subjects, or employees.

It is estimated that over 600,000 laptop computers are lost or stolen each year in the U.S. As more people use laptops as their primary, and often sole, computing device the risk of data loss and theft will increase. Never leave your laptop unattended in a coffee shop, airport bathroom, on a speaker's podium or in other public places. Laptops left in automobiles, even in the trunk, are particularly vulnerable. Laptops should be carried as

hand luggage when traveling.

Backups of the data on your laptop are extremely important. Laptops have a higher likelihood of data loss, either due to rough handling or theft. Without a backup, your important data can be lost forever.

Even when we try our best to protect our laptops, some will be stolen. While the likelihood that a thief will want the information on your laptop is very low, the reality is that California law requires us to notify research subjects and patients if their medical information was on a device that was stolen (regardless of the likelihood of the information being accessed) unless the information is encrypted. If identifiable patient or research subject health information is stored on a laptop or any other removable media (e.g., USB drive, CD, portable hard drive), that information must be encrypted. (Stanford University policy:

https://www.stanford.edu/dept/hipaa/policy_university/security/comput_estorage_device.html).

There is no single encryption method available that works for all situations on all laptops. There are many solutions available, from encrypting a single file to encrypting your whole hard drive. The School of Medicine has some recommendations for encryption at <http://med.stanford.edu/irt/security/protecting/laptops.html>

You can also find more general information about mobile computer security at http://www.stanford.edu/group/security/securecomputing/mobile_devices.html Additionally, you can find detailed technical guidelines on encryption at: https://www.stanford.edu/dept/hipaa/policy_university/security/sg_encryption.html

Contact your local IT support person to help you choose and implement the encryption solution that best fits your needs. You can also contact the School of Medicine Service Desk at 725-8000. In the event of a lost or stolen laptop, contact the School of Medicine Privacy Officer at 725-1825.

Global Medicine

The March 31-April 1st Association of Academic Health Centers (AAHC) annual meeting addressed “Building Academic Health Center Infrastructure Worldwide.” I am a member of the AAHC Board of Directors, and I also participated on a panel on global research issues at this meeting. There is a wide range of activities being pursued by US Academic Medical Centers related to global health that are guided by quite different goals and incentives. They range from faculty-initiated collaborations in research and education to more organized institutional collaborations with one or more countries or international hospitals or medical schools. In some cases they involve management of clinical or other services and in a few instances include degree programs such as those administered by Weil-Cornell Medical School in Qatar and Duke Medical School’s recently initiated MD degree program in Singapore.

Some US institutions appear to be motivated by a sense of mission to engage with the global community to extend their reputation and expertise. Others are motivated by the prospect of financial returns from international patients receiving services at their center or from profits emerging from clinical services provided abroad. At the same time, leaders from other nations look to the US to model the development of more integrated academic medical centers with the goal of better integrating research and education with patient care.

Important perspectives were shared not only about the programs established by affiliation with US Academic Medical Centers (US AMC) but also about the organization and challenges around academic medicine and health care in the United Kingdom, Israel, China, Singapore, and Italy. Failures, as well as successes, were presented, and I concluded that, analogous to the mantra that “if you have seen one academic medical center, you have seen one academic medical center,” the same can be said for international programs and collaborations with US academic medical centers.

The meeting did help to affirm some conclusions I have previously drawn. Foremost among them, while appreciating the objectives of medical centers in running clinical services in various nations, I do not see this activity as consonant or even compatible with our mission at Stanford. Further, while the degree programs between Cornell and Qatar and Duke and Singapore are interesting, I do not see this as a path we should travel. Rather, it seems more prudent to stay focused on what we do well – training leaders in the biosciences and medicine and enhancing our commitment to discovery and innovation. Developing partnerships in these areas, as we have done with the India-Stanford BioDesign Program and with our education collaboration with Shantou Medical School in China, seems a more sensible route to travel. In addition, as we continue to develop our global health program at Stanford, it seems wiser to do so in collaboration with the rest of the university rather than simply as a medical school or academic health center. Understandably, our agenda at Stanford will be further shaped when we recruit the leader of the Global Health Program – the search to fill this position is now underway.

As is often true, I was intrigued by the way health care has or is evolving in other nations and how some assumptions or perceptions run counter to reality. There is no doubt that we can learn much from other nations’ experiences, and I doubt we will really be able to speak about global health until the exchange of information and experience is really bi-directional. In fact, I was intrigued that much of the discussions at the AAHC meeting focused on the knowledge US AMCs could export or the clinical revenue they might import. From my point of view this is too unidirectional. We should also be preparing for the prospect that other nations may seek to export their knowledge and programs to the US or that clinical programs and care will move from the US to other nations – as is already beginning to happen. While we have much to offer in biomedical research, we might also learn a lot from other nations about the delivery of health care and even the education of doctors. In doing so we would really be promoting global medicine.

The Medical Workforce

I have addressed some of the issues surrounding the Physician Workforce dilemma in past issues of the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/04_29_02.html#7, http://deansnewsletter.stanford.edu/archive/11_19_07.html#a). Specifically, during the past year the Association of American Medical Colleges (AAMC) (see: <http://www.aamc.org/workforce/start.htm>) has proposed addressing the projected shortfall of physicians (which for primary care physicians could be 85,000 or more by 2020) by increasing the size of medical school classes by 30% and by supporting the establishment of several new medical schools. In fact, both of these recommendations are underway, although I am not convinced that either will truly solve the problem. The reality is that there is a shortage of primary care physicians (as well as certain specialty physicians), and the data emerging from the National Residency Match Program (including that of two weeks ago) continue to demonstrate that fewer graduating medical students are seeking careers in primary care.

A number of factors contribute to this trend, among which is the relative low compensation for primary care physicians in comparison to that achieved by medical and surgical specialists. Lifestyle issues also contribute to student choice of career pathways. Our medical workforce in the USA is increasingly becoming one dominated by specialists. While this has relevance to the management of patients with complex chronic disorders, it still leaves unsolved the availability of well-trained primary care physicians who can coordinate medical care and provide a "medical home" for patients. Indeed many of you are aware of the difficulty in finding a primary care physician in the Bay Area – a problem heightened by the increasing number of general internists as well as other practitioners who are opting for smaller, concierge practices.

Because we have not mandated – nor likely will we want to do so – the career choice of graduating medical students, I find it hard to imagine that the workforce issues will be solved successfully simply by graduating more medical students. It seems probable that medical school graduates will continue to choose career paths based on the perceptions and experiences that emerged while they were medical students. Even if a student entered medical school with the goal or expectation of becoming a primary care physician, it seems likely that she or he will chose a specialty over primary care by graduation, unless the compensation, lifestyle and career satisfaction of a primary care physician is improved and enhanced. This is addressed, in part, in a recent editorial in JAMA (2008; 299:1595-1597) by Baron, RJ and Cassel, CK entitled "*21st Century Primary Care: New Physician Roles Need New Payment Models.*" Clearly this issue needs serious attention.

Further, it seems narrow minded to address the healthcare workforce issue by focusing solely on producing more doctors. This is not to question that there are likely to be real shortages of physicians in the future. My concern, as already noted, is that simply increasing the number of doctors will not, by itself, solve either the nation's projected workforce needs or the geographic distribution of doctors. Expectations about the numbers of MDs, compared to other practitioners, will also be influenced by whatever

changes occur in health care reform in the years ahead. They may also be impacted by the evolving goals and expectations of other health care professionals.

For example it is of interest that the Council of Advancement of Comprehensive Care (CACC) is promoting a new degree path for nurses called the Doctor of Nursing Practice. Indeed, on April 4th “the CACC and the National Board of Medical Examiners (NBME) today announced that they have reached an agreement to develop and administer a Certification Examination for Doctors of Nursing Practice (DNP). This competency-based examination, which will be administered to DNP graduates for the first time in November 2008, will assess the knowledge and skills necessary to support advanced clinical practice. It will be comparable in content, similar in format and will measure the same set of competencies and apply similar performance standards as Step 3 of the United States Medical Licensing Examination (USMLE), which is administered to physicians as one component of qualifying for licensure” (see: <http://www.pr-inside.com/print517127.htm>). While it is likely that many on the MD side of equation will argue against this additional expansion of the role of nursing, I do not see that position as reasonable assuming that the competencies for general primary care are fully embraced and individuals possessing the DNP degree truly fill the critical void now left in primary care.

Unfortunately, these changes, like those that have occurred in recent years and others likely to follow, are responses to the pervasive market-driven health care system that has evolved in the US. As such they do not necessarily represent what is best from an overall health care perspective - but rather what is achievable. I would hope, of course, that the organization of our health care might be framed more responsively and responsibly and less reactively. But I recognize that is unlikely – but some more thoughtful incremental change might occur when our nation’s health care debate becomes more focused, bi-partisan and more results oriented.

Reflections on Stem Cell Research in California and at Stanford

On April 3-4th Dr. Irv Weissman, Ludwig Professor and Director of the Stanford Institute on Stem Biology, and I participated in the East West Alliance meeting held in Cambridge (UK). The East West Alliance brings together a number of centers and nations who have received support from the Li Ka Shing Foundation and is focused on four major areas: cancer, stem cell, infection and immunity, and aging. The Alliance includes the University of Cambridge, University of California at Berkeley, University of Toronto, University of Manitoba, the University of Hong Kong, the Chinese University of Hong Kong, Institut Pasteur, Shantou University and Stanford.

This year’s Alliance meeting was focused on stem cells and imaging. As you know, support for embryonic stem cell research has been a topic of debate and discussion in the US, where federal support remains restricted, in contrast to the more positive promotion of stem cell research that has occurred in the UK and in Asia. This prompted me to review the situation in California, as well as at Stanford, where Proposition 71 and the California Institute for Regenerative Medicine (CIRM) have played a significant role in

stimulating and supporting stem cell research. I gave a report on this topic at the East West Alliance meeting.

As you will recall, the CIRM was established in November 2004, when nearly 60% of the California electorate voted for the bond that would provide \$3 billion for stem cell research in California universities, research institutes and biotechnology companies. I have had the privilege of serving as one of the 29 members of the Independent Citizen's Oversight Committee (ICOC), the governing body that oversees the CIRM. During the past 41 months, the ICOC has put together the infrastructure as well as policies and procedures for CIRM activities. Their activities have included establishing external scientific review groups and task forces and workgroups that have defined short and long-term strategic initiatives as well as grants and other support for education and training, innovation, and basic and translational disease-based research.

Unfortunately, lawsuits challenging the constitutional authority of Proposition 71 limited use of the bonds until mid- 2007, although limited funding commenced in 2006 thanks to "bond advancement notes." Since then, CIRM has been moving forward steadily, and it now has the potential to enable California to be a word leader in stem cell research. To date CIRM has awarded support for training grants, seed (innovation) grants, comprehensive institutional grants, stem cell techniques, shared resources and new faculty scholars. Importantly, announced new program support includes funding for the development of new cell lines, development of tools and techniques, planning for disease teams, additional new investigator support and, importantly, grants for major facilities. Indeed, Stanford looks forward to learning in May the results of its application for a major facility award.

Given the late start in funding due to the litigation, the CIRM has made great strides to date, with \$259,724,943 having been awarded to 22 institutions for 156 grants. Stanford faculty has been particularly successful to date, having received 15.9% of the total dollars and 15.3% of the grants. Of course, the funding is only a reflection of the more important metric – the quality and significance of the research and the development of future leaders in bioscience and translational research.

In addition, we learned on April 5th that the Major Facilities Group announced the recommendations that will be made to the ICOC for the 12 applicants for major facility grants. Stanford has come out at the top of the list with a recommended funding of \$47.5 million. This is of course wonderful news, although the decision will not be finalized until the May ICOC meeting. It is important to acknowledge the considerable efforts of the many faculty and staff who worked on this application – and I will be more explicit about thanking them once the final decisions are made in May. But for now this is great news.

Updated SMP Shuttle Schedule

Now that the administrative staff at Stanford Menlo Park has settled into their new offices, some changes have been made to the shuttle; the new schedule is on the website

home page at <http://med.stanford.edu/smp/>. Please take this opportunity to visit the new offices.

Upcoming Events

April Centennial Events

As our Centennial observance continues, we're looking forward to our all-school party on Wednesday, April 23, 11:30 a.m. -1:30 p.m. All faculty, students and staff are encouraged to come to the Dean's Lawn (Campus Drive and Roth Way) for a barbeque lunch. In addition to tasty food, there will be a ragtime band adding a "Centennial touch" to the day.

In addition, as mentioned in the last Newsletter (http://deansnewsletter.stanford.edu/archive/03_24_08.html#4), we will be collecting items for a time capsule to be opened in 100 years. Attendees are encouraged to bring a contemporary item that reflects the "spirit of the present" for the capsule that will be opened in the year 2108. Items for the time capsule don't have to be related to the medical school but can simply represent the spirit of our times. Some suggestions include: a Stanford ID badge, a personal statement of "Life at Stanford in 2008," predictions for 2108, photographs or CDs, electronics (such as memory sticks), course catalogues or periodicals. Items may not be perishable or contain liquid and must be no bigger than a cubic foot. Items will be collected and displayed on a table at the lunch. There will also be guest books available to sign with written memories or predictions for 2018. You are also encouraged to submit your predictions and memories to the Centennial Web site at <http://med.stanford.edu/centennial/guestbook.html>.

Since we want everyone to come to this special event, there will be shuttle service available to and from each off-site location. For more details on the lunch, shuttle service and other Centennial events, see the Centennial Web site at <http://med.stanford.edu/centennial/events.html>.

During the same week the Basic Mechanisms in Immunity and Infection Symposium, another Centennial event, will take place on April 24-25 in the Clark Auditorium. Additional information is listed in the "Upcoming Events" of this Newsletter.

Finally, our Centennial web site has just been updated with new highlights including a focus on minorities in medicine, including information about Stanford programs that foster growth in this area. In addition there is an interesting look at medical instruments over the years and a look at Match Day 2008, the immediate future for our graduating seniors.

Basic Mechanisms in Immunity and Infection Symposium
April 24-25, 2008
Clark Auditorium

The Basic Mechanisms in Immunity and Infection Symposium will highlight several major advances in our understanding of the genes and gene products that comprise the immune system and its normal response to foreign invaders as well as its aberrant response in auto immune diseases. There will be four sections covering Innate Immunity: Cellular Immunity mediated by T cells and B cells; the molecules determining immune cell trafficking in the organism; and the events that lead on the one hand to complete tolerance to self proteins, and on the other hand, to evasion of these tolerance mechanisms resulting in auto immunity. In addition to Stanford faculty, the list of speakers includes Drs. Lalita Ramakrishnan from the University of Washington, Jean-Pierre Casanova from the University of Paris, Andrew Chan of Genentech, Harold von Boehmer from Harvard, Diane Griffin from Johns Hopkins and Hidde Ploegh from MIT. For additional information about the Symposium, contact Michele King at michele.king@stanford.edu; phone: (650) 498-3084.

Awards and Honors

- **Jonathan Pollack, MD, PhD**, Associate Professor of Pathology is one of thirteen recipients of a 2008 Clinical Scientist Award in Translational Research of the Burroughs Wellcome Fund. Congratulations to Dr. Pollack.
- **Ron Alfa**, first year medical student, has been selected as the 2008 nominee by the Osler Medal Committee of the AAHM. He has been awarded the Osler Medal for his essay "Redefining Inert: The Birth of the Placebo in American Medicine." Congratulations, Ron.

Dean's Newsletter April 21, 2008

Aging and the Medical Workforce

In the April 7th issue of the Dean's Newsletter I offered some comments and reflections on the medical workforce (see: <http://deansnewsletter.stanford.edu/#4>). A new report issued by the Institute of Medicine (IOM) on April 14th has further highlighted the issue of the medical workforce, in this case as it relates to the aging population. Indeed, Dr. Jack Rowe, who chaired the committee that produced the report, which is entitled "*Retooling for an Aging America: Building the Healthcare Workforce*" (see: <http://www.iom.edu/CMS/3809/40113/53452.aspx>), opened his presentation at the Council of the IOM I attended this past week by noting that the number of geriatricians in the US (currently 7100) has declined by 22% since 2000. The declines are even more acute for nurses' aides and home health aides. Since the population of older adults is forecast to grow to more than 20% of the US population over the next several decades, there will be serious shortfalls in the workforce available to provide medical care to the elderly. Parenthetically, the IOM report is also timely in view of the Spring 2008 issue of *Stanford Medicine*. Entitled "*The Long of It: The Globe Turns Gray*" (see: <http://stanmed.stanford.edu/2008spring/index.html>), the issue addresses a wide range of topics related to longevity.

The IOM Report “calls for bold initiatives starting immediately to train all health care providers in the basics of geriatric care and to prepare family members and other informal caregivers, who currently receive little or no training, in how to tend to their aging loved ones. Medicare, Medicaid, and other health plans should pay higher rates to boost recruitment and retention of geriatric specialists and care aides.” In addition, the report proposes more stringent criteria to measure knowledge and competence in geriatric care. But the report also highlights an important systemic issue that limits attracting physicians and other professionals to geriatric medicine – the poor reimbursement to providers and care facilities.

For example, a general internist might earn an average of \$175,000 in 2005. However, despite extra years of training (beyond general internal medicine), a geriatrician’s compensation actually declined to \$163,000 in 2005 dollars. Similar salary discrepancies are also observed for nurses, pharmacists, social workers and others who specialize in geriatric care. One reason for this is the lower rate of reimbursement by Medicare for primary care – a factor that is likely contributing to the primary care workforce in the US – a topic I have also recently addressed (see:

http://deansnewsletter.stanford.edu/archive/03_24_08.html#1). The problem is further exacerbated by Medicare’s focus on acute care rather than chronic management and lack of coverage for preventive services or non-physician providers as well as by the fact that the Medicare Trust Fund is slated to run out of money by 2019.

The IOM calls for significant progress by 2030 (which is pretty late given the current situation) and focuses on assuring greater competence in geriatric care, doing a better job in the training, recruitment and retention of the workforce and on creating improved models for health and health care for the elderly. As noted, many of the issues highlighted in this report are generic to our somewhat fractured health care system and are best seen as an important part of health reform. With that, we also need to assure that we are doing a better job in educating our students and trainees in geriatric care – and to caring for the elderly both in and outside of medical settings.

Continued Evolution of Conflict of Interest Issues

The past several weeks have seen the continued evolution of physician-industry interaction and conflict of interest issues. I have previously commented on the legislation introduced by Senators Grassley and Kohl entitled the “Physician Payment Sunshine Act” (see: http://deansnewsletter.stanford.edu/archive/11_19_07.html#b), which would require pharmaceutical and device companies to disclose gifts or payments given to doctors. The Senate committee is extending this request to “medical education gifts,” which relates primarily to fees or gifts provided for continuing medical education (CME). The pending legislation surrounding this issue has prompted a number of drug and device companies to indicate that they will publicly disclose such gifts or payments, probably on their websites – although a national data base is likely to be forthcoming. As you know, Stanford came forth with restrictions on gifts from industry in its October 2006 Industry Interactions Policy (see: <http://med.stanford.edu/coi/siip/>) although this most recent issue

has specifically addressed CME. The pending threat of legislation has prompted a number of companies to note that they will disclose payments more broadly, including those to disease advocacy groups as well as doctors. This is part of a continuing evolution of industry interactions with the medical profession.

And while modest by any standard, it is notable that the April 15th *New York Times* reported on three academic physicians who have elected to stop receiving gifts or payments from industry (<http://www.nytimes.com/2008/04/15/health/15conf.html>). They plan to sustain their interactions with industry but without personal compensation or payment. This is, of course, a personal choice, but I suspect that this trend too will continue.

Further, in light of the inquiries from the Inspector General as well as the Grassley committee, the NIH has issued regulations establishing standards and procedures for institutions that apply for funding (see: http://www.access.gpo.gov/nara/cfr/waisidx_06/42cfr50_06.html) and has posted a fact sheet to address some of the most commonly asked questions (see: <http://grants.nih.gov/grants/policy/coifaq.htm>). In addition to the “institution” questions there are a series of queries and facts for investigators that you may wish to familiarize yourself with. These include the following – the responses to which can be found at the NIH site noted above.

1. Who is required to disclose financial interests?
2. Who is considered an “Investigator” for this purpose? Is it only the Principal Investigator?
3. I am a post-doctoral fellow receiving funding from the NIH. Does this regulation apply to me?
4. I am a graduate student working on research funded by the NIH. Am I subject to the requirements of the FCOI regulation?
5. I am a collaborator/contractor/subcontractor/subrecipient performing research funded by the NIH but am not employed directly by the Institution that received the award. Does this regulation apply to me?
6. Which financial interests do I need to disclose?
7. What about assets held by my spouse or children? Are they included?
8. Does this include salary paid me by my Institution as an Investigator?
9. To whom should I report my financial interests?
10. When should I report these interests to the Institution?
11. What happens if my financial situation changes during the award period?
12. I am an investigator in an NIH-supported clinical trial network. My network has developed a study-wide policy for the trial that requires me to disclose my Significant Financial Interests to my network’s steering committee/operations office on an annual basis. Do I need to disclose my Significant Financial Interests to my Institution as well?
13. I’ve heard there is a special requirement for clinical research? Is this true?
14. I have heard about changes in the conflict of interest regulation for Investigators employed at the NIH. Do these apply to me?

15. I have been asked to give a paid presentation at and participate in a review of a non-profit research Institution. Do I need to report the income I receive from these activities?
16. Am I required to disclose interests in mutual funds?
17. What about stock options?
18. What about “blind trusts”? Are those included in this regulation?
19. Is income from royalties included in this regulation?
20. Are foreign investments (e.g., shares in a foreign corporation) covered by the financial disclosure requirement?

I feel confident that many will find these questions have relevance to them and their work. Please note that most are captured in Stanford’s Conflict of Interest Policies (see: <http://med.stanford.edu/coi/>) and that our on-line “Tips for Avoiding Conflict of Commitment and Interest” may also be informative to you (see: <http://med.stanford.edu/coi/tips.html>).

Changes in the Opportunities for Clinician Educators

To fully meet and address our missions in education, research and patient care, we need a faculty that is expert in each domain and who interact and collaborate successfully. Our overarching goal of “making and translating discoveries” is grounded in basic research and also includes interdisciplinary research, education and patient care. Investigators, clinician-scholars/investigators and clinician-educators each play an important role individually and collectively.

When I arrived at Stanford in 2001, many viewed the Medical Center Line, which had been in existence for a decade (and is now referred to as Clinician-Scholar/Clinician Investigator Line), as “second class.” Since then we have made considerable progress in making these faculty an essential component of our professoriate, beginning with the Academic Senate approval of Principal Investigators status in January 2003 (http://deansnewsletter.stanford.edu/archive/10_13_03.html#1) and also by the interchangeability of the UTL and MCL faculty billets based on the scope and appropriateness of responsibilities rather than a preformed categorization.

Unfortunately, while the role of the Clinician-Scholar/Clinician Investigator has become more valued, misperceptions and misunderstandings now seem to abound regarding the Clinician Educator Line, which we introduced in July 2004 (see: http://deansnewsletter.stanford.edu/archive/07_26_04.html). This is unfortunate, since I certainly view members of the Clinician Educator faculty as valued and important members of our medical school community. Indeed, Clinician Educators play important roles in a number of clinical departments (e.g., Pediatrics, Anesthesia), where they are highly valued and fully embraced. Unfortunately, other clinical departments have relatively few Clinician Educators and some even express a bias against them, which is most unfortunate. Importantly, Clinician Educators receive among the highest scores for medical student clinical teaching and are valued patient care physicians.

To facilitate a greater engagement of Clinician Educators with the Medical School professoriate, David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, Harry Greenberg, Senior Associate Dean for Research, and Ann Arvin, Vice Provost and Dean of Research, and I met with the Provost to discuss the role of Clinician Educators in clinical trial research. Based on that discussion the Provost has approved that Clinician Educators who are at the rank of Clinical Assistant Professor, Clinical Associate Professor and Clinical Professor may serve as a Principal Investigator for the Stanford site on multi-center, industry-sponsored clinical trials. To enable this to occur, a Clinician Educator faculty member needs to submit a waiver request to her or his department chair. In turn the chair must verify that the Clinician Educator will have protected time to conduct the clinical research and that she or he is qualified to serve as a site PI. Approvals will be through the Senior Associate Dean for Academic Affairs and the Senior Associate Dean for Research (see: <http://med.stanford.edu/rmg/piwaiver.html>).

Hopefully these actions will provide another opportunity to bring our community into closer alignment and to foster our shared missions in education, research and patient care

Support for Graduate Students

As many of you know, in October of 2006 the NIH implemented a cap on tuition reimbursement of \$16,000 for new and renewing NSRA training grants. This adds an even greater financial strain on programs with graduate students on training grants, many of which are already struggling under the existing shortfall in both tuition and stipend support. The total School of Medicine tuition cap impact in FY07 was \$192,000 (in addition to the existing shortfall in both tuition and stipend), but will rise to \$1.2 million in FY08. Importantly the impact of the NIH cap is projected to increase to \$3.5 million by FY12, at which point all training grants will have come under the cap.

To help address this important issue we have been working for over a year to define both short and long term solutions. We are grateful to the Provost and the Office of Graduate Education for making funds available from the Stanford Graduate Fellowship (SGF) program that will help mitigate the shortfall over the next five years. In fact, the Provost has committed \$4.5 million in SGF funds to be distributed from FY08-FY12 to schools with training grants, based on the number of training grant students as of August of the prior year.

In addition, beginning in Autumn Quarter 07-08, SGF support will provide 100% of the tuition cost of SGF fellows, which eliminates the need for the 19% School of Medicine tuition contribution for those students; the annual savings in the School of Medicine will be \$250,000 a year, and I have committed to reroute these dollars also towards graduate student support.

For longer-term solutions, we have done a detailed review of all endowments committed to education and focused on those that could have an expanded purpose. This has required considerable time and effort and I am appreciative to the role that Sam Zelch, Chief Financial Officer and Assistant Dean for Fiscal Affairs, and his team played in this

review. They have identified approximately \$66 million of endowment that can be allocated to support graduate education and related programs. Indeed, this will yield approximately \$3.6 million per year, of which we will allocate approximately \$2.9 million in annual income to support graduate student training grant tuition support. This should help to provide a long-term solution to the challenges that arose from the NIH tuition cap. We will also allocate approximately \$0.7 million annually to help support other important graduate education programs including the ARTS (Advanced Residency Training Program at Stanford – see below), the Masters in Medicine and the Medical Science Training Program (MD-PhD).

I hope that these allocations will provide some relief for faculty who support graduate students through training grants. In addition, we will also commit ourselves to seeking philanthropic support for our graduate education programs, and I hope that faculty will join with me and our Office of Medical Development to help raise those funds.

Applications for the ARTS Program are Invited

Current Stanford residents and clinical fellows interested in combining clinical training with advanced research training are invited to apply to the Advanced Residency Training at Stanford (ARTS) Program (see: <http://med.stanford.edu/arts/> for more details).

The ARTS program offers the opportunity to obtain a PhD degree during or upon completion of residency or clinical fellowship. The program begins with approximately 12-48 months clinical training toward board certification in any area of interest, followed by research training in a graduate program in the Schools of Medicine, Engineering or Humanities and Sciences at Stanford University. The ARTS program will provide tuition, stipend and health benefits to successful applicants. Dr. Sam Gambhir, Professor of Radiology and Bioengineering, is the Program Director. The application deadline is October 1, 2008 for applicants who seek to begin their PhD coursework in the Fall of 2009.

If you are interested please contact the ARTS Program Office for more information. You can call (650) 724-9139 or email: sofias@stanford.edu

Stanford Institutes of Medicine 1 (SIM1) Continues to Move Forward

A number of individuals have asked me whether the large excavation site near campus drive is for SIM1. The answer is no. That site is part of the Connectivity Project and will be the new loading dock for many current and all new buildings. The loading dock also connects to a series of underground tunnels that will deliver supplies to school buildings in the years ahead. We expect that this project will be completed by the end of the year.

At the same time we are indeed making progress with SIM1. The site for the future 200,000 gross available square foot (gasf) building is now marked off just south of the CCSR, and the program planning and architectural design are nearly complete. The latest architect renderings were presented to the Land and Buildings Committee of the

University Trustees on August 8th and were well received. A website for the building will soon be set up, but I am providing a couple of the most recent renderings here for your information.

View of SIM1 from the Academic Walk

View from Campus Drive (moving west)

The design of SIM1 will serve as the prototype for future research buildings, including the other SIMs and the Foundations in Medicine (FIM) buildings. We currently anticipate groundbreaking for SIM1 to take place this summer and for the project to be completed in 2010.

Changes in NIH Peer Review is Coming

In the November 5th Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/11_05_07.html#1) I discussed some of the potential changes to the NIH peer review system. And in the March 10th issue of the Newsletter (http://deansnewsletter.stanford.edu/archive/03_10_08.html) I outlined the proposed changes in peer review that were publicly posted and sought comments that we could share with NIH. I received very few comments. Over the past weeks I have spent time with various leaders at NIH discussing the proposed changes and offering data to place some of them in a reasoned context. Based on those discussions, it seems clear that the process for change in peer review is on a fast track and that some of the recommendations will be brought forth more formally in the next month. While a number of the proposed changes are likely to be helpful, some are potentially more challenging. We will monitor this issue and get back to you as information unfolds. But do be prepared for some changes in the peer review process in the not too distant future.

Of course the major change that everyone is hoping for is an increase in the NIH budget. But, as I have also said in numerous settings, that seems unlikely given the current economic situation, even with a change in administration and more political support for NIH. Virtually every leader I have spoken with in DC fears that there is simply not going to be the discretionary funding available to address the NIH funding level for some time. The impact of this is already noteworthy - since the flat funding began in 2003, the NIH has lost more than \$3.6 billion in purchasing power. Changes in peer review, even if well intentioned, could have unintended consequences, making it important for all of us to carefully assess the proposed changes.

Security and Information Technology

In the most recent issue of the Dean's Newsletter I featured a commentary on laptop security based on recommendations from Dr. Todd Ferris (see: <http://deansnewsletter.stanford.edu/#2>). This issue has become increasingly more contentious with recent thefts of laptop computers from NIH scientists that contained patient-related clinical trial data. This follows the highly publicized case that occurred on January 20, 2007 when a laptop containing patient data was lost at the Birmingham VA, which prompted very strong reactions from the VA leadership and from the Congress. There is no question that IT security, especially of patient information, must be protected. There is also no question that such information is now contained on a number of servers and computers within academic medical centers and that even with encryption there is not likely to be truly de-identified data. At the same time, despite recent computer losses, there has not yet been theft of patient sensitive or related information – although this is certainly not a reason for not exercising rigorous security measures.

On Friday, April 18th I attended a special meeting hosted by the AAMC and the VA to discuss the current data security. While some of the more stringent rules within the VA have created heightened anxiety and frustration for VA scientists and physicians, along with tensions between VA and academic affiliates, it is also quite clear that issues of

security and information technology cannot be viewed as a VA-specific issue. Indeed it impacts the entirety of our academic medical centers and universities as well.

I found the discussions to be helpful and thoughtful as leaders of the VA and various university/medical school, NIH and AAMC leaders shared experiences and sought solutions. It was generally agreed that all institutions need an IT security blueprint and that this must be coupled with a plan for a cultural transformation about data safety, one that recognizes that we are in a new day of both information access as well as oversight scrutiny. Accordingly, we all need plans for implementing the blueprints and plans.

It is also clear that IT security must find a balance. There is simply no “zero risk” scenario that is workable. It is imperative that the research must continue and that relationships and data sharing between VA and university affiliates must be assured. A firewall that simply surrounds the VA and excludes the academic center is simply not workable. At the aforementioned meetings, examples of successful partnerships between the VA and university/medical school leaders at both the University of Pennsylvania and Yale were described. Their success included very close and effective working relationships between the leaders and community. It required developing an inventory tool to assess the highest risk situations, since it is clear that risk stratification is essential in moving forward. This further involved a critical review of investigator laptops and desktops to assure that they contained the appropriate encrypted software and that higher risk servers met criteria of the FISMA (Federal Information Security Management Act) or at least had a path to achieving such an accommodation. In some cases this involved an external audit.

I am aware that our Stanford IRT and data security groups have done an excellent job to date in data security and that there are ongoing efforts to secure patient sensitive data within the medical school and also with our VA colleagues. But it is also clear that this will require ongoing efforts, since it is unlikely that any uniformly applicable solution exists. But if there is a willingness to engage collaboratively, it is also clear that progress can – and indeed must - be made. This collaboration will require faculty involvement as well as that of IT and university leaders to be successful.

Cancer Center Holds Another Successful Member Retreat

On April 7th the Stanford Cancer Center held its 2008 Member Retreat featuring presentations on Cancer Imaging and Early Detection, Women’s Cancers, Opportunities for Genetics and Population-Based Research, Molecular Therapeutics, New Initiatives for Immunology Research and a number of breakout discussions on topics ranging from cancer stem cells to cancer survivorship. This year’s keynote speaker was Dr. John Niederhuber, Director of the National Cancer Institute, who commended Stanford for its progress as a cancer center and also addressed some of the important challenges and opportunities that lie ahead. It is gratifying to note how the Cancer Center at Stanford is maturing and is attracting an ever-larger faculty group committed to cancer research, care and prevention. I offer my special thanks to Dr. Irv Weissman, Ludwig Professor and

Director of the Stanford Cancer Center and Dr. Bev Mitchell, Becker Professor of Medicine and Deputy Director, Stanford Cancer Center.

Upcoming Events

All-School Centennial Celebration Luncheon This Wednesday! All faculty, students and staff are encouraged to come to the Dean's Lawn (Campus Drive and Roth Way) this Wednesday, April 23rd between 11:30 am and 1:30 pm for a barbeque lunch.

This special gathering is to commemorate the 100th anniversary of the School of Medicine. In addition to tasty food, there will be a ragtime band adding a "Centennial touch" to the day. There will also be a display of items going into a time capsule to be opened in the year 2108. You are encouraged to bring an item that reflects the "Spirit of 2008" to include in the capsule. There will be guest books circulating at the luncheon for your entries. Additionally, we are starting to receive predictions for 2108 and memories of life at the School of Medicine on the Centennial Web site at <http://med.stanford.edu/centennial/guestbook.html>.

For more details on the lunch, shuttle service (between the main campus and offsite locations) and other Centennial events, see the Centennial Web site at <http://med.stanford.edu/centennial/events.html>.

The Centennial web site has also been updated with new stories. In the "Centennial Spotlight" is one of Stanford's and the world's top scientific leaders, Paul Berg, PhD. Included is information on Dr. Berg's science, as well as his philanthropy, plus a very special video he produced in 1971 to explain protein synthesis in layman's terms. In addition there is the story behind the J.E. Wallace Sterling Muleshoe Lifetime Achievement Award (to be present at the upcoming Alumni Weekend) and a look towards our future with the Learning and Knowledge Center.

And, as a final note, you can now download our custom Centennial logos from the Centennial web site <http://med.stanford.edu/centennial/logos> These designs can be used on print (ie. letter head) and other communication.

The 2008 Symposium on Improving Diversity in Graduate Education: The Annual Symposium on Improving Diversity in Graduate Education will be held on Monday, May 5 at Noon in Munzer Auditorium and will be followed by a reception in the Dean's Courtyard. This year's speaker will be Tyrone Hayes, PhD, Professor of Integrative Biology at UC Berkeley. The title of Dr. Hayes presentation is "All Men are Created Equal and Other Truths We Hold to be Self-Evident."

Dr. Hayes will also be the Biology Department Seminar Speaker on May 5 at 4:15pm in Hewlett 201 where he will speak about "From Silent Spring to Silent Night: A Tale of Toads and Men." The Symposium is sponsored by the School of Medicine Office for Graduate Education and School of Humanities and Sciences Biology Department. For more information please contact Anika Green, agreen1@stanford.edu

The Stanford Digestive Disease Center will hold its Annual Symposium on May 3, 2008 at Hewlett auditorium, in honor of Dr. Stanley Falkow, the Robert W. and Vivian K. Cahill Professor. This year's Symposium is entitled *Through the Intestinal Tract with Gun and Camera*.

Dr. Falkow will give a presentation of the same title. Other scientific luminaries who will be presenting at the symposium include Philippe Sansonetti of Institut Pasteur, Paris; Brett Finlay of University of British Columbia, Vancouver; Jeffrey Gordon and Virginia Miller of Washington University, St. Louis, along with Stanford faculty speakers Gary Schoolnik, David Relman, Denise Monack and Manuel Amieva (Symposium 2008 Director). Dr. Harry Greenberg is the director of the DDC. The Symposium is co-sponsored by the Institute for Immunity, Transplantation and Infection (ITI) and the Department of Microbiology and Immunology.

Awards and Honors

- **Dr. Lucy Shapiro**, the Virginia and DK Ludwig Professor of Developmental Biology and Senior Fellow at the Freeman Spogli Institute for International Studies has been awarded the Charles and Martha Hitchcock Professorship for 2008-09 by the University of California (UC). Since it was established nearly a century ago, the Hitchcock Professorship has become one of the most distinguished endowments at UC and has featured a number of distinguished past winners such as Neils Bohr, Robert Oppenheimer, Noam Chomsky and Steven Chu. Dr. Shapiro adds to this list of luminaries and we offer her our congratulations and admiration.
- **Dr. Stanley Rockson** was named the first holder of the Alan and Tina Neill Professorship of Lymphatic Research and Medicine at a wonderful event held in the Cantor Arts Museum on Friday April 11th. This new professorship was a gift of Alan and Tina Neill, who have personally experienced the challenges of lymphatic disease. Through this professorship they have highlighted the importance of research in lymphatic disorders and have honored Dr. Rockson, one of the world's leading experts in this important but understudied area of medicine. Please join me in congratulating Dr. Rockson and in thanking the Neill family for their wonderful contribution.
- **The Stanford Pain Management Center** is being honored as one of six centers of excellence in the nation by the American Pain Society for its successful multidisciplinary approach to alleviating the suffering for patients afflicted with chronic pain disorders. The Stanford Pain Management Center treats 6,000 patients a year who are seen by a multidisciplinary team of doctors, psychologists, physical therapists and occupational therapists. Please join me in congratulating Dr. Sean Mackey, MD, PhD, chief of the Division of Pain Management at Stanford Hospital & Clinics and associate professor of anesthesia at the Stanford

University School of Medicine along with his colleagues for this wonderful recognition.

Appointments and Promotions

- ***Debra M. Ikeda*** has been promoted to Professor of Radiology, effective 4/01/08.
- ***Edward E. Manche*** has been promoted to Professor of Ophthalmology at the Stanford University Medical Center, effective 4/01/08.
- ***Stanley G. Rockson*** has been promote to Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 4/01/08.

Dean's Newsletter May 5, 2008

Tradition or Transformation: Celebrating the Past or Creating the Future*

Many institutions pay homage to past achievements as a way to justify or claim a right to their current status. In coming to Palo Alto seven years ago, I realized immediately that Stanford is a very different kind of institution. It is less bound to tradition and, in fact, doesn't display many of the trappings of its history – rich as it is. Rather, it is more focused on opening new vistas and directions.

This being the Centennial year for the School of Medicine, I want to reflect on our past history for at least a moment, perhaps as a way to better understand who we are now and where we are going in the future. And while it is true that the founding of the Stanford University School of Medicine began in 1908, its real origins can be tracked nearly five decades before then.

1858. This was the year that Darwin and Wallace presented their papers on the theory of evolution to the Linnean Society in London. It was also the year of the Lincoln-Douglas debates, often with loftier rhetoric than the “debates” taking place in 2008. But 1858 was also the year that Elias Samuel Cooper, a young surgeon, recently arrived in San Francisco, established at the University of the Pacific the Medical Department bearing his name. The Cooper Medical School began with 6 faculty and 13 students. Of course, this was a time when so-called medical schools were springing up everywhere, often without any defined admission criteria or curriculum. The Flexner Report that would change all that came 52 years later, following critical reviews and commentaries on the status of medical education by Charles Eliot, President of Harvard University, along with the Presidents of Columbia, Penn, and Michigan, among others.

Unfortunately, Elias Samuel Cooper, said to be a somewhat contentious and controversial figure, died of nephritis only four years later, in 1862. Around that time, Dr. H.H. Toland established a competing medical school in his name. He affiliated it with the University of California and, in doing so, established the roots of UCSF. As part of this process, he

tried to recruit the faculty of Cooper to Toland – setting the stage for the first failed merger between UCSF and what later became Stanford Medical School.

In 1870, Levi Cooper Lane, nephew of the then-deceased Elias Cooper, revived the medical school. Over the next two decades a new hospital and education facilities were constructed on Webster and Sacramento Streets – the cost of those facilities was \$125,000. To further solidify the Cooper Medical College, Dr. Lane appointed Dr. William Ophuls as a full-time salaried professor in 1898 (and who also served as Dean of the Stanford Medical School from 1916-1933) – a decision that was important when the Flexner Report was issued 12 years later. This Report established the fundamental requirements for a medical school – including the need for a full-time faculty and a scientific foundation for medical education as well as criteria for medical school admission and for curriculum.

Discussions about the possible association of Cooper Medical College with Stanford began in 1901 – ten years after Stanford had been established as a university – and paved the way to the founding of Stanford University School of Medicine in 1908.

1908. This was the year Frederick Cook reached the North Pole. It was also the year of the opening of the 4th Olympiad in London, perhaps best noted by the disqualification of Dorando Petri's marathon run when, apparently dehydrated and disoriented, he ran backwards during the last 300 yards of the race. While his finishing time was better than mine, at least I maintained my directional orientation in the 112th running of the Boston Marathon on April 21st, 2008. But of course 1908 was the year that David Starr Jordan, Stanford's first President, agreed that the Cooper Medical College would become the Stanford University School of Medicine. He had two conditions. First, that it be a school for medical research (which was debated hotly by the clinical faculty of the day) and second, that it could not cost the university more than \$25,000 a year to operate. President Jordan was prophetic on both accounts. While likely not relevant, it should also be noted that David Star Jordan had held a Doctor of Medicine degree – although he did not practice medicine. In fact he is one of three Stanford presidents to hold an MD degree – the other two being Presidents Wilbur and Tressider.

The first 50 years of the Stanford University School of Medicine were marked by significant growth in the clinical programs. Students spent their first year on the Palo Alto campus and then moved north for their remaining education. The school's early history was affected by two world wars and a great depression. Accordingly, class size varied, although it averaged about 50-60 in number. Proving that history cycles in defined intervals, curriculum renewal occurred in 1920 – the major unique feature of which was an allocation of 200 hours of free time during the four-year curriculum. Given the length of didactic sessions, this probably amounted to about 0.01% free time – notably less than that found in our New Stanford Curriculum (relatively speaking). At the same time, students in the second decade of the 20th century were expected to write a thesis in order to graduate. And, also part of the cyclical wheel of institutional transformation, new facilities were constructed in 1927 for \$3.75 million – clearly a fraction of the amounts anticipated in 2008.

In 1951, plans were put forth to consider the move of the School of Medicine to the Stanford campus in Palo Alto, in part based on the report of the Faber Committee (Harold Faber was the Chair of Pediatrics at the time). This plan was embraced by President Wallace Sterling and became a topic for serious discussion during the next several years.

1958: The year Sputnik fell to earth and also the year of the first major league baseball game in California, which was played in the San Francisco Seals Stadium - the SF Giants beat the LA Dodgers by a score of 8 to 0. I am a bit embarrassed to note that I remember that game, more because the Giants and Dodgers had both left New York City, where I was growing up, than because of the game itself. But, of course, 1958 was the year that Stanford Medical School stood poised to be united geographically with its parent university in Palo Alto and where a new medical school and hospital would open a year later at a cost of \$21 million. This move changed the trajectory of the medical school and must be attributed to the vision of President Sterling (an historian) along with Provost Fred Terman (an electrical engineer) and Dean Robert Alway (also a pediatrician!), who recognized the opportunity to leverage federal funding for research and create a research-intensive school of medicine. The move from San Francisco disenfranchised a number of the clinical faculty who elected to remain in the city. At the same time, Sterling, Terman and Alway recognized that recruiting the most talented individuals they could find would help place Stanford on a new level. So they did just that.

In 1959 Arthur Kornberg was recruited from Washington University to found Stanford's new Department of Biochemistry. One of his conditions for moving was bringing his entire Department of Microbiology from Washington University – which is exactly what he did. Included in this highly distinguished group – each of whom had remarkable careers over the decades that followed – was Dr. Paul Berg. In addition to Dr. Kornberg, Dr. Josh Lederberg was also recruited, from Wisconsin, to found a new Department of Genetics. With newly minted Nobel Prizes and intellects and energy that spanned many domains, they set a new trajectory for Stanford Medicine. It is sad to note that these two remarkable scientists, Kornberg and Lederberg, both died within six months of each other this past year. Their legacies live on in everything that Stanford Medical School now is and will be in the future.

Other leaders were also recruited at the time of the School's move to Palo Alto, including Drs. Norm Kretchmer in Pediatrics, Hal Holman in Medicine, Robert Chase in Surgery, David Hamburg in Psychiatry, Avrum Goldstein in Pharmacology and Henry Kaplan in Radiology. These leaders recruited other stellar faculty to join them and catapulted Stanford Medical School into national prominence. Over the past 50 years the contributions of Stanford faculty and students have been remarkable. Without question the continuing and enduring excellence in basic discovery research has been the most important distinguishing feature of Stanford Medical School. It has always been visionary and opened new paths in discovery and innovation – frequently crossing traditional disciplinary boundaries and thus taking advantage of Stanford's excellence in engineering and the physical sciences. It is the faculty and the special environment that creates contiguous connections between these disciplines that has made Stanford such as special

place. This has been further enhanced by the connection of the medical school to its two major affiliated hospitals and of the medical center to the university and its community – including the intellectual vitality of Silicon Valley and the concentration of biotechnology and device companies – a number of which have been spawned by Stanford.

Of course, these past 50 years have also been marked by the education and training of countless medical and scientific leaders. Beginning with the Five Year Plan and extending to the New Curriculum of 2003, Stanford has been consistently innovative and focused on the close connection between science and medicine. This has also fostered a spirit of innovation that has resulted in major impacts on numerous clinical fields including cardiovascular surgery and medicine, cancer, neuroscience, transplantation, child health and numerous medical and surgical discoveries. It has also played a seminal role in creating new fields, including structural biology, developmental biology, genomics, neurobiology and more recently stem cell biology and regenerative medicine. Progress can be measured in a number of ways. In *War and Peace*, Leo Tolstoy posits that the events of the moment are often the result of countless prior events that converge at a point in time. But that is not really the story of Stanford Medical School, where the steps, rather than being very small and incremental, have more frequently been leaps into new and previously unrecognized directions.

As we close the first century of Stanford Medicine and open the next, we face both opportunities and challenges. There can be little question that the prospects for ever-deepening insights in human biology stand before us that, if properly nurtured and supported, will unfold in an incredible and even exponential fashion. But at this very moment of promise, we are threatened by serious external and some internal challenges. Funding to support basic research is increasingly threatened by the declining budget of the National Institutes of Health – which it seems likely to continue, given the current economic challenges and turmoil in the US. Coupled with this is a fragmented and increasingly unaffordable health care system that features disparity and high cost as well as remarkable success in technical excellence and innovation. At the same time, the perceived value of the physician as a healer has been eroded by the past decades during which market forces have been used to correct a fundamentally flawed health care system. Of course these and other events bode for challenging times.

This makes it all the more important for Stanford to sustain its leadership role in the years and decades ahead. While we face many challenges, I believe we have taken steps in the right direction. We have renewed and reaffirmed our commitment to educating leaders who will shape the future of science and medicine. We continue to reaffirm and do all we can to support excellence in basic research. And we seek ways to foster novel interconnections between the biosciences and the physical and engineering sciences through programs like BioX and Bioengineering. We have also committed resources to bring the basic and clinical faculty of the medical school together and to join them with the rest of university to advance knowledge and its translation to improving the lives of adults and children through our Stanford Institutes of Medicine and their related Centers of Excellence at Stanford Hospital and the Lucile Packard Children's Hospital. We also

seek to build on the excellence of our basic and clinical science departments as anchors for the education and training of students and fellows as well as research and patient care. And we have committed ourselves to focus our efforts on improving the quality and safety of patient care and to reach out to our communities, locally and globally.

Stanford is a small research-intensive medical school and will continue to be so. But it is also unique and has had an impact that far transcends its size. This is ultimately the result of the creativity and energy of our faculty, students and staff. It is also the consequence of their motivation – which is to focus on transformation rather than tradition. Except for these reflections we will not dwell on the past – but rather work to shape the future.

**The article is based, in part, on the presentation I gave at the School of Medicine Centennial Dinner Celebration that was held on Friday evening, April 25, 2008.*

Celebration for the Li Ka Shing Center

On April 25th we also had the opportunity to celebrate the official groundbreaking of the Li Ka Shing Center for Learning and Knowledge. It is exciting to announce at long last that, thanks to a generous donation, the Learning and Knowledge Center will be named in honor of Li Ka Shing, an extraordinarily remarkable and successful individual who has committed many of his personal resources to supporting education and research in China and, increasingly, around the world. Additional details about the Li Ka Shing Center and the groundbreaking event can be found in the April 28th Stanford Report (see: http://med.stanford.edu/news_releases/2008/april/lkc.html).

In addition to thanking Mr. Li for his wonderful generosity and for his commitment to education broadly and medical education more specifically, I would like to thank Ms. Solina Chau, the Director of the Li Ka-shing Foundation, who also played an important role in our discussions about the Li Ka Shing Center and who represented Mr. Li at the groundbreaking (really a “beam signing”) event. It is our hope that Mr. Li will be able attend in person when the Li Ka Shing Center opens in 2010.

Of course I also want to thank Millie and Paul Berg for their remarkable gift to the Li Ka Shing Center (<http://news-service.stanford.edu/news/2007/april25/med-berg-042507.html>) along with all the other remarkable contributions they have made to Stanford over the past half-century. In addition I want to thank Professor Joe and Hon Mai Goodman for their generous gift that will name the Simulation Center in the Li Ka Shing Center – and which will complement the Goodman Simulation Center that they helped support for the Department of Surgery and that is housed at the Stanford Hospital and Clinics (see: http://med.stanford.edu/news_releases/2007/may/goodman.html). Further, I want to thank Akiko Yamazaki and Jerry Yang for their contribution to the Li Ka Shing Center, and I especially thank Ms. Yamazaki for her important role as the co-director (with Paul Berg) of the Li Ka Shing Center Council. Other members of the Council include Drs. Jeff Bird, Linda Clever, Tom Krummel, Amy Ladd, Tom Raffin and David Stevenson. I am indebted to them for their many contributions and efforts to bring this project to fruition. I also want to thank CJ and Ha Lin Huang for their generous

donation to the Li Ka Shing Center – and for all the other gifts they have made over the years.

These individuals, along with many others, have enabled us to nearly meet our fund-raising target for the Li Ka Shing Center – which we hope to fully achieve before this important project is completed and the Li Ka Shing Center becomes another of our transformational centers for the School of Medicine. I also want to acknowledge the support and leadership of the Office of Medical Development and, in particular, Bruce Bingham, who has led the Li Ka Shing Center fundraising effort for Medical Development. If you are interested, regular updates on the construction of the Li Ka Shing Center for Learning and Knowledge is regularly updated at <http://lkc.stanford.edu/>.

Transitions: Alumni Return, Admitted Students Visit and Preclinical Students Move to the Clinics.

This past week witnessed a number of transitions for students and faculty across the generations and even history of Stanford Medicine. On April 25-26th the Stanford University Medical Center Alumni Association held its annual Alumni Weekend, which featured a broad spectrum of events and opportunities for alumni to meet socially and professionally. I had the opportunity to visit with a number of distinguished alumni at the Senior Luncheon on Friday, April 25th and to welcome a number of them to our special Centennial Dinner that evening. In addition to recognizing the important contributions of every alumnus and alumna, the Board of Governors recognized two individuals as recipients of J.E. Wallace Sterling Muleshoe Lifetime Alumni Achievement Awards – which this year were presented as part of our Centennial Dinner. The recipients are:

- **Larry Boxer, MD '66**, currently Director of Pediatric Hematology/Oncology and Associate Chair for Academic Affairs at the University of Michigan. As noted in the program: *This award recognizes Dr. Boxer's contributions to the care of critically ill children...His successes as a physician-scientist, clinician and teacher have been recognized nationally and internationally.*
- **Donald Prolo, MD '61**. Dr Prolo is a neurosurgeon who *as a clinician with a passion for medical politics (he) is being honored for his lifetime service as a dedicated neurosurgeon. In addition to his practice, he has been a member of Stanford's clinical faculty for more than thirty years, has invented three medical devices and is the former president of the Santa Clara County Medical Association.* I would add that his daughter Laura is an MD/PhD student in neuroscience at Stanford.

On Tuesday evening, April 22nd I had the opportunity to attend the Student Clinician Ceremony, which was held in the Schwab Center. Thanks to contributions from the Arnold P. Gold Foundation and support from the Drs. Ben and A. Jess Shenson Fund, a dinner was held to mark the transition of students who have successfully completed their preclinical studies and who will soon commence their clinical education. This is an important and significant transition in the lives and education of our students and it is

wonderful to both acknowledge and celebrate it. The ceremony was also an opportunity to honor recipients of the Arnold P. Gold Foundation's Humanism and Excellence in Teaching Awards, which were presented to Stanford residents and Fellows. These individuals and their colleagues play a vital role in the education of our students and we are all indebted to them. This years honorees are:

- ***Sarah Azad, MD***, Department of Obstetrics and Gynecology
- ***Monica Eneriz-Wiermer, MD***, Department of Pediatrics
- ***Ahmir Khan, MD***, Department of Neurology
- ***Lana Schumacher, MD***, Department of Surgery
- ***Dan Sedehi, MD***, Department of Medicine
- ***Jacob Towry, MD***, Department of Psychiatry

Congratulations to these honorees – and best wishes to our students as well.

Just as alumni were returning to Stanford to renew friendships and share memories and experiences of years past, we also welcomed newly admitted students to the class that will enter this August during “Admit Weekend.” More than 70 students met each other as well as current medical students, faculty and staff to learn more about the Stanford experience and determine whether this is the best place for their medical and scientific training. Naturally, I can't think of a better place to attend medical school – especially for those seeking careers that will help them become leaders in medicine and the biosciences. With over 6500 applicants it is enormously challenging for the admissions committee to identify the students who are admitted to Stanford – and more importantly, who will be successful and happy in this unique environment.

Clearly this has been a week of transitions that mark the path of a life journey in medicine and science. Such experiences also affirm that what makes an institution like Stanford so special is the quality of those who have come before us – and those who will help shape the future of all of us.

Serving the Community and Meeting New Neighbors

In addition to our focus on discovery and innovation in medicine and the biosciences, many of our faculty, students and staff also seek ways to work with our communities – locally and globally – with the hope of making the world a better place. A number of important School of Medicine community outreach programs are under the umbrella of our Office of Community Health (OCH) led by Dr. Marilyn Winkleby, Professor of Medicine, and Rhonda McClinton-Brown, Executive Director of OCH (see: <http://och.stanford.edu/>).

Among the School's community programs are the Cardinal Free Clinics, which include the Arbor Free Clinic (which was launched in 1990) and the Pacific Free Clinic (which was founded in 2003). On Tuesday evening, April 29th, the Cardinal Free Clinics held its annual Volunteer Appreciation Reception to thank the many students (undergraduate, graduate and medical) who staff the clinics and serve as managers and leaders, as well as

the many faculty and community physicians and community members who volunteer their time and provide supervision, consultation and support to these weekend clinics. I have much admiration and respect for all the individuals who give so much of their time to help those who would not otherwise have access to medical screening and diagnostic services.

But each time I think about the free clinic concept, I also can't help but reflect on how sad it is that such services are required in our communities. In a nation as wealthy as the US and with more than 16% of the gross domestic product (GDP) spent on health care, it is tragic that so many members of our community are underserved. While I certainly agree that it is important to find ways to provide services to these children, adults and families, it is even more important to work to transform the deficiencies in how we provide health and health care in this nation. So far the solutions coming forth from government leaders are modest – even though healthcare is rising higher on the list of concerns for the American public. We must all hope that as the rather meaningless discussions currently taking place on the national political scene reach their conclusion this Fall, a more serious effort will emerge to finally address the deficiencies in our healthcare system. I have many hopes for how this might evolve – and the outcomes that might be achieved – one of which is that “free clinics” would no longer be needed as safety nets for the underserved.

In addition to our community services and partnerships, on Saturday, April 26th, members of our Stanford at Menlo Park (SMP) team (as well as a few DFAs) introduced themselves to their new Menlo Park neighbors. Thirty staff undertook an all day project to help an elderly member of the Menlo Park community continue to live in safety and comfort in her home of 53 years. On the same day, over 5,000 volunteers throughout the Peninsula participated in renovating over 80 homes and schools. The day's events were made possible by Rebuilding Together Peninsula.

Alicia White was extremely appreciative of the time and effort that went into providing the new doors, new washer/dryer, landscape improvements, bathroom upgrades, and a completely repainted home and garage. Thanks to JZCool Eatery and Wine Bar of Menlo Park for providing lunch for our volunteers. A special thank you to all School of Medicine staff that participated in making Mrs. White's home a safer, more comfortable place to live.

Conflict of Interest at a State and National Level and Beyond

Regulations and guidelines regarding conflict of interest continue to evolve and become codified. On April 24th the Massachusetts State Senate unanimously passed a law that would ban all gifts to physicians from pharmaceutical companies. This is the first time a state has brought forth legislation to restrict a practice that many feel has contaminated the relations between medicine, industry and the public they serve. The bill still needs approval from the State House of Representatives and Governor Deval Patrick. At nearly the same time, the Association of American Medical Colleges has published the report of its Task Force on Industry Funding of Medical Education (see:

<http://www.aamc.org/research/coi/industryfunding.pdf>). It is notable that both the Massachusetts bill and the AAMC report follow closely the policies that were introduced at Stanford in October 2006 in our Stanford Industry Interactions Policy (see: <http://med.stanford.edu/coi/siip/>). Since we introduced our policies on gifts and interactions with industry for education an ever-increasing number of hospitals and medical centers have adopted similar policies. Now with the publication of the AAMC recommendations it seems inevitable that these will be nationally adopted. And, it is also noteworthy that both states and the federal government have been proposing legislation to address this issue – which of course is a failure of medicine to adequately regulate its own professional activities.

In addition to the policies noted above, a School of Medicine Task Force on Industry Support for Continuing Medical Education has been working since last August to examine this important topic. I met with the Task Force on April 25th and anticipate bringing their report to the Executive Committee for presentation. I anticipate that a decision about this issue will be made in the next several months.

Notable Events

Immunology and Infectious Disease have featured prominently in recent events. On April 24-25th the Institute for Immunity, Transplantation and Infection (ITI) hosted a terrific two-day symposium on “*Basic Mechanisms in Immunity and Infection*.” And then on Saturday, May 3rd, ITI joined with the Department of Microbiology and Immunology and Stanford Digestive Disease Center to host an outstanding symposium entitled “*Through the Intestinal Tract with Gun and Camera*.” This symposium was made extra special by being held in honor of **Dr. Stan Falkow**, Cahill Professor and “father” of bacterial pathogenesis.

Centennial Update

The Dean’s Office would like to thank everyone who donated items for our Centennial time capsule. We were very impressed with the time and thought that went into the various contributions. Items submitted thus far include tissue samples; pipettes signed by entire labs; handwritten letters; photos of students with their families; a remanufactured ink cartridge; and various publications authored by Stanford faculty. There’s still time to be a part of history. Contributions for the time capsule will be accepted at the Dean’s Office through June 13th. Items may not be perishable or contain liquid and must be no larger than a cubic foot. The capsule’s final destination will be the ground floor of the Li Ka Shing Learning and Knowledge Center. The capsule will be installed when the building opens in the Spring of 2010.

This week’s Centennial event is the much- anticipated **Medicine and the Muse** at 5 pm, Tuesday, May 6th in the Clark Auditorium. This program, which is part of Stanford Center for Biomedical Ethics, is highlighted this week on the Centennial web site: <http://med.stanford.edu/centennial/>.

Next week we look forward the **25th Annual Medical Student Research and 5th Annual POM Population Health Symposium**. Everyone is encouraged to attend this event on Wednesday, May 14th in the Hospital Atrium from 3:00 – 6:00 pm. In addition to the original research presentations of MD and MD/PhD students, the first year class will present their community-based Population Health Projects completed as a part of the Practice of Medicine course. Approximately 70 students will be presenting at this event.

Students will be available at their posters for informal discussion from 3:00-5:30 pm. At 5:45 p.m. closing remarks will include Dr. Charles Prober, Senior Associate Dean for Medical Education; Dr. Laurence Baker, Director of the Scholarly Concentrations Program; and Dr. Preetha Basaviah, Practice of Medicine Course Director. The event will culminate with the announcement of student awards by the Alumni Association.

Two student presentations from the Symposium on May 14th will be invited to give an oral presentation at Medicine Grand Rounds the June 4th, am in Braun Auditorium in the Mudd Chemistry Building.

This promises to be a terrific event and I hope you will join our students for this year's Student Research and Population Health Symposium.

Upcoming Events

On Thursday, May 15th, Medical School Office Building (MSOB), Room x303 251 Campus Drive, Stanford, CA 94305, from 4-6 pm., **Dr. John Seffrin**, Chief Executive Officer, American Cancer Society, Atlanta Georgia, USA and Immediate Past President, International Union Against Cancer, Geneva, Switzerland will give a presentation on "A Ticking Time Bomb: The Global Tobacco Pandemic – Current and Future Scenarios". This event is sponsored by The Stanford Global Tobacco-Free Research Initiative Center for Democracy, Development, and the Rule of Law Freeman Spogli Institute for International Studies http://cddrl.stanford.edu/research/the_global_tobaccofree_research_initiative/, and is part of the Colloquium Series 2007-2008. Light refreshments will follow. For more info contact S. Ayres at 650-723-6145.

Honors and Awards

- **Professors Minx Fuller** (Developmental Biology) and **Ron Levy** (Medicine) learned on April 29th that they were among the 72 new members elected to the National Academy of Sciences. I would also add that Rick Aldrich, who left Stanford a couple of years ago for UT-Austin, was also elected. This is among the very highest honors a scientist can achieve. Please join me in congratulating Drs. Fuller, Levy and Aldrich.
- **Ms Elsie Gyang**, SMS I has been awarded a Fulbright Fellowship and will be obtaining a Masters in Health Policy, Planning and Financing through a joint program offered by the London School of Hygiene and Tropical Medicine and the London School of Economics and Government. Congratulations to Ms Gyang!

- ***Lyen Huang***, SMS 6/6, has been awarded a scholarship by the Kaiser Permanente Asian Association and The Permanente Medical Group for his work with the Pacific Free Clinic. The award is given to a graduating medical student for service to the community at large.

Appointments and Promotions

Vishnu Priya Akula has been promoted to Clinical Assistant Professor (Pediatrics), effective 2/01/2008.

Lucy Carin has been promoted as Clinical Professor (Pediatric; Neonatology and Developmental Medicine), effective: 5/01/08.

Clara Choi has been appointed as Clinical Assistant Professor (Neurosurgery), effective 5/01/07.

Kavin Desai has been appointed as Clinical Assistant Professor (Pediatrics), effective 1/01/08.

Ira Friedman has been appointed as Clinical Associate Professor (Pediatrics), effective 9/01/03.

Arun Grupta has been promoted to Clinical Assistant Professor (Pediatrics), effective 2/01/08.

Gordon Haddow has been appointed as Clinical Associate Professor (Anesthesia), effective 3/01/08.

Charles Hill has been promoted as Clinical Assistant Professor (Anesthesia), effective 6/01/08.

Tzielan Lee has been reappointed as Clinical Assistant Professor (Pediatrics; Rheumatology), effective 5/01/08.

Richard Lin has been appointed as Clinical Assistant Professor (Ophthalmology), effective 4/01/08.

Klaus Porzig has been reappointed as Clinical Professor (Medicine; Oncology), effective 3/01/08.

Emily Ratner has been appointment as a Clinical Professor (Anesthesia), effective 4/01/08.

Anjali Bhatt Saxena has been promoted to Clinical Assistant Professor Medicine; Nephrology), effective 2/16/08.

Masoud Mark Taslimi has been reappointed as Clinical Professor Clinical Professor (Obstetrics and Gynecology; Maternal-Fetal Medicine), effective 6/01/08.

Julie R. Williamson has been appointed as Clinical Assistant Professor (Anesthesia), effective 8/01/08.

Anton Wyss-Coray has been reappointed to Associate Professor (Research) of Neurology and Neurological Sciences, effective 5/01/08.

Dean's Newsletter

May 19, 2008

Looking Forward

Based on thoughtful and insightful discussions with Dr. Gary Schoolnik, Professor of Medicine and of Microbiology & Immunology, I appointed a Task Force in June 2007 to explore the issues and challenges surrounding the transitions faced by senior faculty. One of my reasons for initiating this process was a long-standing concern that faculty frequently defer career planning and sometimes get backed into options they did not anticipate, plan for or even prefer. This was also part of the concern expressed to me by Dr. Schoolnik, who, while still a very successful physician-scientist, can anticipate a time when his own competitive success in grant application or other professional pursuits would require significant change or at least redirection. I admire Dr. Schoolnik for raising these concerns – which almost certainly mirror those of many individuals.

Further, as lives and careers extend over longer periods of time, these issues will become even more germane. Choices about transitioning from active to part-time work, to new directions or to retirement are influenced by many factors, which are often highly individualized. These include health status, economic security, outside interests, and family considerations, among others. To help assess the depth and breadth of these issues, Dr. Schoolnik agreed to chair the Senior Faculty Transitions Task Force – along with Dr. Kathryn Gillam, Senior Advisor to the Dean, who served as co-chair. The work of this Task Force is nearly complete and in future issues of the Dean's Newsletter I will detail the important and extensive findings and recommendations that have come forth from this group.

While not getting into the details of the Task Force Report itself, I want to tell you about an interesting conversation I had with a group of senior and emeritus faculty. Each year I host a luncheon to recognize these important members of our community, and I generally use the event as an opportunity to provide a “state of the school” address or to discuss some other important topic of shared interest. At this year's luncheon, which was held on May 11th, I initiated a conversation about faculty transitions, and I shared some of the preliminary findings of the task force as well as some of my own observations. I was

particularly interested in hearing from these individuals about their own thoughts and reflections, and I asked for comments either at the luncheon or by follow-up email.. I received both.

Of course I cannot say that the attendees of this luncheon are truly representative of all senior or emeriti faculty or that those who spoke or communicated by email necessarily reflect the common experience. But several messages struck me as relevant. Among these is that, in general, those who felt happy with their lives and careers prior to retirement continued to be happy following their personal transitions, perhaps because they had continued to pursue issues or topics of real interest to them. Several individuals commented that their personal transitions offered opportunities to begin new careers or interests: returning to school, becoming a teacher outside of medicine, pursuing interests in history as a scholar or docent, writing books for the public (even if sometimes based on medical themes), and enjoying or contributing to the arts, among others. The personal narratives that were offered were wonderful to hear and even inspiring – although those who spoke may be the individuals who have made the most successful personal transitions.

Based on data collected by the Faculty Transitions Task Force that I will summarize in a subsequent report, it is also clear that a large number of faculty are not planning – or have not planned – for their personal transitions, either financially or programmatically. These are the individuals I worry about, and I hope we can provide some future guidance and support to them. Most of us have encountered senior members of our community – sometimes among the most distinguished members – who have moved beyond the peak of their skills and, sometimes unknowingly, have lost awareness of their role and relevance. It is easy for this to happen, especially when plans about career transitions have not been developed . But the consequences of not planning can be significant and sometimes devastating. Individuals of enormous distinction can lose the respect of peers and the broader community, dimming or even diminishing the glow of their contributions. That should not happen if we plan wisely – although for many individuals such planning is not easy or even welcomed.

My hope is that in the next months we will come forward with a series of recommendations that will assist with faculty transitions. I want to underscore that this initiative is not about driving individuals to retirement. It is quite the opposite. It is about opening doors to successful life transitions – something we will all need to do at some time and place.

Reflecting Backward

Because of the many demands on my time and the importance of focusing on issues that impact the school, medical center, university and broader community, I have long abandoned my once all-consuming role as an active investigator and contributor to the knowledge base of science and medicine. That transition has not been easy on a deep personal basis, but I have viewed it as necessary so that my energies can be directed toward institutional goals rather than individual scientific pursuits. But this past week one of my former colleagues was being “knighted” for his contributions to a field to which I

had also contributed, and I was invited to participate in a symposium in his honor. Ordinarily I would not have attended such an event for reasons already mentioned, but out of personal loyalty I decided to do so.

Preparing my presentation offered an opportunity to reflect on some of own work in a field I had spent years working in and permitted me to put the data into historical context as well as the present tense. In doing so, and in ways relevant to my comments about senior faculty transitions noted above, it is interesting to observe how once major topics of interest slip into the background and become the building blocks for the queries of others. Of course we all know this and certainly recognize that the information we learned in prior years (or decades) has been refined, reshaped and often replaced by new observations, insights or discoveries. Few discoveries stand the test of time and the ages and even the most important of these will blur into the interstices of the centuries. But even the more minor findings and discoveries help trigger the next chain of observations – sometimes leading to newer insights but, more often, simply becoming subsumed into the continuum of discovery. While I am unlikely to take the time for similar events in the future, I am pleased that I did so this time – since having a chance to reflect backwards opens a better appreciation of what lies ahead.

Further Thoughts on CIRM and Stem Cell Research

May 7th was a major step forward for stem cell research in California and beyond. The approval of major facility grants, as reported nationally and locally (see: <http://med.stanford.edu/mcr/2008/cirm-0514.html>), provided further evidence of the commitment of the citizens of California to advance this important field. Without these efforts it is clear that the US would have lost its opportunity to contribute to the significant and highly promising field of regenerative medicine. Indeed, the unfortunate collision of science and religion championed by the current White House has left most US scientists without support to pursue embryonic stem cell research. And even if there is a change in federal policy with a new administration later this year, the declines in NIH funding during the past several years will almost certainly make the federal investment in stem cell research modest compared to its potential. Thus, the California Institute for Regenerative Medicine (CIRM) has become even more important. Because of CIRM, stem cell research will proceed in California with what we anticipate will be significant successes in advancing the basic and translational science of stem cell biology and regenerative medicine. And with the new facilities that will be constructed across the state, the ability to further advance this field will be enhanced now and well into the future. This is good for California, the nation and the world.

Understandably the future of this research and its success will be achieved by the faculty, students and staff who conduct the critical experiments and, ultimately, the pivotal clinical trials. These individuals deserve and have received our thanks and appreciation for moving the science forward and for creating the basis for the facilities and infrastructure to support this important work. But is also important and appropriate to thank and acknowledge the individuals who put together the application for the facilities proposal at Stanford – and without whom success could not have been achieved. These

include: Lang Anh-Pham, Director of Finance and Administration in Stem Cell Bio Regenerative Medicine; Niraj Dangoria, Assistant Dean in Facilities Planning and Management; Marcia Cohen, Senior Associate Dean for Finance and Administration; Jennifer Cory, Division Manager in Medicine; Michael Longaker, Deane P. and Louise Mitchell Professor in the School of Medicine and Professor, by courtesy, of Bioengineering; Chris Shay, Project Manager and Planner, Office of Facilities Planning and Management; Bob Reidy, Vice President, Land, Buildings and Real Estate; Renee Rejo Pera, Professor of Obstetrics and Gynecology; BJ Sewak, Program Manager, Project Management; Theo Palmer, Associate Professor in Neurosurgery; Chris Webb, Institutional Proposal Development Manager; and Irv Weismann, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Developmental Biology &, by courtesy, of Biological Sciences.

Our thanks to all of these dedicated professionals.

Orthopedic Presents Programs to Community Leaders

On Monday May 5th the Department of Orthopaedic Surgery hosted an evening event on “The Impact of Orthopaedic Research on Your Activity and Health.” Led by Dr. Bill Maloney, Elsbach-Richards Professor and Chair of the Department of Orthopaedic Surgery, a number of informative presentations were given that were of considerable interest to the more than 100 attendees from the community. The program included:

- ***Introducing Sports Medicine at Stanford: A Team Approach to New Knowledge*** (Dr. Gordon Matheson, Director, Sports Medicine Programs, Professor of Orthopaedic Surgery)
- ***Sports Injuries: Sidelined or in Peak Performance?*** (Dr. Thor Besier, Director, Human Performance and Biomechanics, Assistant Professor of Orthopaedic Surgery)
- ***What's a Nice Knee Like You Doing in a Joint Like This?*** (Dr. Tom Andriacchi, Professor of Biomechanical Engineering and Orthopedic Surgery)
- ***Tell Me Where It Hurts: Determining the Cause of Pain Before Choosing Surgery*** (Dr. Todd Alamin, Assistant Professor of Orthopaedic Surgery)
- ***Will Surgery Really Help*** (Dr. Gene Carragee, Vice Chairman and Director, Stanford Spine Center, Professor of Orthopaedic Surgery)
- ***A New Way to Salvage Damaged Joints: Cellular Grafting to Reverse the Death of Bone*** (Dr. Stuart Goodman, Robert L and Mary Ellenburg Professor of Surgery)
- ***How Current Research in Tissue Engineering Will Transform Orthopaedics in the Next Half-Century*** (Dr. Bill Maloney)

Following these presentations, the faculty and guests broke up into small group discussions that focused on:

- *Arthritis and Joint Replacement* (Drs. Stuart Goodman, James Huddleston, and Bill Maloney)
- *Exercise and Sports Medicine* (Dr. Gary Fanton and Gordon Matheson)
- *Hands and Limbs* (Drs. Thor Besier and Amy Ladd)
- *Spine and Back* (Drs Todd Alamin, Gene Carragee and Ivan Cheng)

I felt that the program was highly informative and very well received. Thanks to all.

Addendum to Previous Dean's Newsletter Story

Following the publication of the remarks about the history of the School of Medicine that I made at the April 25, 2008 Centennial Dinner (<http://deansnewsletter.stanford.edu/#1>), Dr. Leslie Zatz, Professor of Radiology Emeritus, and Dr. Richard Hoppe, Professor and Chair in Radiation Oncology, wrote to point out the important role played by Drs. Henry Kaplan and Avram Goldstein in the recruitments of Dr. Arthur Kornberg and other transformational scientists to Stanford after the move of the school from San Francisco to Palo Alto. The story has been edited to clarify when Drs. Kaplan and Goldstein came to Stanford and to acknowledge their crucial role in our history. Thanks to Dr. Zatz and to Dr. Hoppe for this important clarification.

Basic Science and Clinical Research Faculty Photo Shoot

I want to let you know that the Public Web & New Media Group within IRT is hosting photo shoots for all basic science and clinical research faculty at the School of Medicine on Tuesday, May 20, and Wednesday, May 28. Photos will be taken free of charge and on a first-come, first-served basis from 9 a.m. to 4 p.m. in the Beckman Lobby, ground floor.

These shoots are offered in collaboration with the Dean's Office and the Office of Communications & Public Affairs and will supplement the physician portraits taken by Stanford Hospital & Clinics and Lucile Packard Children's Hospital, which are used widely across the medical center. The goal is to create a collection of up-to-date portraits of all school faculty. Portraits from these sessions will be made available, as appropriate, for use by the media and in the school's print and online communications, including the school's Web sites, press releases, the Medical Center Report and the CAP profile system. All participants will receive copies of their portraits for their own use.

All basic science and clinical science faculty who are not credentialed at the hospitals are invited to participate. Clinical faculty involved in patient care at SHC and LPCH are encouraged to attend the physician photo shoots regularly offered by the hospitals.

Pictures will be taken against a neutral beige backdrop. Please avoid wearing striped or checkered clothing. For more information, please contact the school's Web editor, Pamela Lowney, at plowney@stanford.edu or 650-644-5539.

Awards and Honors

- ***Dr. Phil Beachy***, Ernest and Amelia Gallo Professor of Developmental Biology and Member of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, received the highly prestigious 2008 March of Dimes Award for his seminal work in developmental biology. He shares this award with Cliff Tabin of Harvard. Congratulations to Phil Beachy!
- ***Drs. Henry W. Jones III, Adjunct Clinical Professor of Medicine, and Jeffrey Croke, former Adjunct Clinical Associate Professor of Medicine***, were honored

recently at the Ten Year Anniversary Celebration of the Stanford University Introductory Seminar Program for their long and distinguished service in teaching Stanford freshmen and sophomores in this special program. Congratulations to Drs. Jones and Croke!

- **Peter Parham, Ph.D., Professor of Structural Biology**, has been elected a Fellow of the Royal Society, which is composed of 1300 of the most distinguished scientists from the United Kingdom and around the world. He was distinguished for his work defining the molecular basis and functional effects of polymorphisms of human major histocompatibility complex (HLA) class I molecules and their killer cell immunoglobulin-like receptors (KIR). Congratulations to Dr. Parham.
- The following are the five student research winners of the 25th Annual Medical Student Research and the 5th Annual Practice of Medicine Population Health Symposium. They will receive their certificates and prizes at an awards dinner sponsored by the Stanford Medical Alumni Association on May 28th.

Mark Chao

John Downey

Matthew Goldstein

Paul Nuyujukian

Roberto Ricardo-Gonzalez

Congratulations to all.

Appointments and Promotions

- **Carol K. Conrad** has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 5/01/08.
- **James L. Hallenbeck** has been promoted to Associate Professor of Medicine (General Internal Medicine) at the Veterans Affairs Palo Alto Health Care System , effective 5/01/08.
- **Jeffrey Gould** has been reappointed to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 5/01/08.
- **Hendrikus J.M. Lemmens** has been promoted to Professor of Anesthesia at the Stanford University Medical Center, effective 5/01/08.
- **Jesse K. McKenney** has been appointed to Assistant Professor of Pathology and Urology at the Stanford University Medical Center effective 5/01/08.
- **Paul J. Sharek**, has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital , effective 5/01/08.
- **Hugh B. Solvason** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center , effective 5/01/08.

- *Patricia Suppes* has been appointed to Professor of Psychiatry and Behavioral Sciences, effective 6/01/08.

Dean's Newsletter

June 2, 2008

2008 Incoming Graduate Student Class is Selected

Most everyone will readily agree that the quality of the student body is the lifeblood of a university. We are fortunate at Stanford to attract among the most talented and creative students in the world. On May 20th the Biosciences at Stanford announced their incoming class for 2008 – and I have heard much acclaim from the department chairs about the overall quality of the students who will be joining Stanford graduate programs this fall.

This year 1289 students applied to one or more of Stanford's 18-degree granting basic science departments and interdisciplinary programs (IDPs). Two of these are housed in the School of Humanities and Sciences (Biology and Biophysics), but the admissions for all 18 are coordinated through a common application process. Bioengineering and Biomedical Informatics are handled separately from the Biosciences admission process. Based on the quality of the applicants 167 offers of admission were made (this was more than the number of slots available, but it recognized the fact that most of these applicants had multiple offers from other universities), and 98 accepted the offer (58 will be in the School of Medicine and 35 in Humanities and Sciences). This year's 56% yield is the second highest on record for Stanford Biosciences and is evidence of how highly students regard these programs. As in past years the greatest numbers of students come from Stanford, Harvard, UCSF, UC Berkeley and MIT, but overall students were accepted from some 56 colleges and universities. The entering class also includes 19 international students as well as 14 students who are under-represented minorities (using the NIH definition). This is the most diverse Biosciences class on record – which, when coupled with the outstanding academic records of the students, makes this a banner year.

In addition to the Biosciences, the Department of Bioengineering had 428 applicants (391 for the PhD program and 37 for the Master of Science program). Of these, 15 students accepted an offer to attend the PhD program (3 of whom will defer), for a 57% yield. Three students will join the MS program. Of the 12 students who will be joining the PhD program this fall, six are women and two are underrepresented minorities.

I want to offer my special thanks to the basic science department chairs and IDP directors, faculty and student leaders for their important participation in the interview and selection process. Also thanks to Anika Green, Assistant Dean; John Bray, Assistant Dean; Ellen Porzig, Associate Dean; and John Pringle, Senior Associate Dean for Graduate Education, for their leadership as well as to Dr. Tenea Nelson (Genetics) and Dean's Office Staff members Velessa Peairs, Jennie Visitacion and Jayanthi Subramanina for their tremendous support during the application, interview and

admissions process. And, of course, welcome to the 2008 incoming class of Bioscience graduate students!

Approval for a Stanford CTSA: Great News

On Wednesday May 28th we received the wonderful news that Stanford has been selected as one of 14 institutions to receive a CTSA (Clinical and Translational Science Award), which now links 38 academic health centers focused on fostering translational research and education (see: http://med.stanford.edu/news_releases/2008/may/CTSA.html). This award, selected through a rigorous peer review process, will provide \$30 million to Stanford over five years to focus on forging interdisciplinary connections between the medical school and medical center, the university and innovators in Silicon Valley. The Stanford CTSA is unique in that it will knit together interdisciplinary programs across the university, hopefully with a significant impact on faculty and trainees within and outside of the medical center. The crux of our effort will be the Stanford Center for Clinical and Translational Education and Research (SCCTER), an independent institute that will operate outside traditional school boundaries.

While a large number of individuals worked diligently on the CTSA application, I want to single out Dr. Harry Greenberg, Senior Associate Dean for Research and Joseph D. Grant Professor of Medicine, for his leadership in this effort. An enormous amount of vision, leadership, collaboration and community building was needed to bring this major program together – and Dr. Greenberg's role was key. He was joined by an impressive group of co-directors including Dr. Phil Lavori, PhD, Professor of Biostatistics and Chair of Health Research and Policy; Dr. Charles Prober, MD, Professor of Pediatrics and Senior Associate Dean for Medical Student Education; Dr. Branimir Sikic, MD, Professor of Medicine; and Dr. David Stevenson, MD, Professor of Pediatrics as well as Vice Dean and Senior Associate Dean for Academic Affairs.

Among the highlights of the CTSA proposal are the following:

1. Grants for early-stage research aimed at improving health, with priority given to interdisciplinary projects with researchers across the university.
2. Two “technology accelerator” programs, one for medical technology and the other for drugs and diagnostics. These programs will build on the Biodesign Program, which trains students and fellows in medicine, engineering and business to develop biomedical devices, and the SPARK program, which provides a year of funding for promising biomedical projects and mentoring by faculty with company experience.
3. Fellowships in technology transfer.
4. A community office to improve access to clinical trials and to increase the flow of information about the trials' outcomes back to participants.
5. Expanded support for researchers undertaking a clinical trial, including guidance

in trial design, clinical informatics, biostatistics, institutional and governmental regulatory process, and new resources for human genetics, tissue microarray histology and immune monitoring. This will help support the efforts of our already successful SPCTRM (Stanford/Packard Center for Translational Research in Medicine) program (see: <http://med.stanford.edu/spctrm/>), which is led by Dr. Steve Alexander, Professor of Pediatrics.

6. Administrative staff to coordinate activities, programs and institutes related to human health across the university. Among these are programs based at the medical school, such as the Masters of Medicine program, which gives PhD candidates exposure to clinical medicine, and the Advanced Residency Training at Stanford program, which allows clinical fellows to pursue graduate training en route to becoming physician-scientists. The SCCTER program will also link programs based outside the medical school, such as the Stanford Center for Longevity, the Woods Institute for the Environment, the Freeman Spogli Institute for International Studies and BioX, the interdisciplinary biomedical research program.

Winning the CTSA is great news, even though the budgets for the 14 awards were cut significantly due to the financial limitations at the NIH. Nonetheless we believe that this award will help advance our mission in *Translating Discoveries* and, in doing so, will create additional alliances and collaborations across the university. Again, thanks to Dr. Harry Greenberg and his colleagues for the key roles they played in bringing this proposal to successful fruition.

Supporting Basic Science

As discussed previously in a number of different forums, the Basic Science programs are facing significant challenges in funding their graduate student populations as well as their research. As I reported in my April 21st newsletter (http://deansnewsletter.stanford.edu/archive/04_21_08.html), we have found several sources of funding to help specifically with graduate student funding, which has been especially hard hit by the NIH Training Grant Tuition Cap. To summarize:

- The Provost has committed \$4.5 million in Stanford Graduate Fellowship (SGF) funds to be distributed from FY08-FY12 to schools with training grants, based on the number of training grant students as of August of the prior year.
- In addition, beginning in Autumn Quarter 07-08 and continuing for a 5-year period, SGF support will be providing 100% of the tuition cost of SGF fellows, which eliminates the need for the 19% School of Medicine tuition contribution for those students; the annual savings in the School of Medicine will be \$250,000 a year, and I have committed to reroute these dollars also towards graduate student support.
- We have also done a detailed review of all endowments committed to education and have identified approximately \$66 million of endowment that can be allocated to support graduate education. This will yield approximately \$3.6

million per year, of which we will allocate approximately \$2.9 million in annual income to support graduate student training grant tuition support.

- Finally, this NIH Training Grant Tuition Cap support is being made available to both Basic Science and Clinical Departments.

In addition to this support, we have reformulated the “D-Block” allocation of the operating budget formula, on which the basic science departments (with the exception of Genetics) and Comparative Medicine have increasingly come to rely over the past several years; D-Block funding increased by \$1.3 million last year, from \$3.9 million in 2007 to \$5.2 million in 2008. The new formula for 2009 will ensure that all the basic science departments have adequate funds for operations and to build reserves. The principles to which we adhered in formulating the new D-Block included:

- The formula delivers to each department approximately the same dollar amount or more than the FY08 deficit support.
- Any savings will be retained by the department and should be used to build Emergency or Academic Development/Strategic reserves.
- The formula is intended to help the majority of the departments reach their target reserve amounts by year five (5).
- We expect the supplemental formula to cover all additional requirements; no additional OB funding will be provided.
- Departments will need to reduce expenses or use other funds to cover deficits.
- The portion identified as targeted to reserves will be funded directly to the Department’s Emergency or Academic Development/Strategic reserve funds.
- When the reserve goal is reached, the supplemental allocation will be reduced in the current and subsequent years.
- The formula will be reviewed annually and adjusted as necessary.
- The FY09 total OB amount is formulated and then capped at the FY08 OB total amount plus up to one-fifth (1/5) of the Department's Emergency & Academic reserve shortfall.

Components of the new formula include a reimbursement for the 5% OB reduction; a faculty supplement for over-the-cap salaries; a faculty supplement based on rank; a space supplement for HHMI supported space; and a space supplement based on faculty rank.

As a result of the new D-Block formula, almost \$3 million more will be distributed in FY09 than was given in FY08—a total of \$7.5 million. This will allow departments to build their emergency and academic reserve funds while operating at an efficient level in the black. I believe this represents a fair and generous resolution to the financial issues that have beleaguered the basic science departments in recent years.

Center for Biomedical Imaging at Stanford

On Friday May 23rd, the kickoff meeting for the Center for Biomedical Imaging at Stanford (CBIS) was held in the Clark Center. It featured a lecture by Dr. Marc Ghysels on “CT Scanning of Works of Art and Antiquities.” (This was certainly more advanced

technology than that featured in the work of Dr. Indiana Jones in the film that opened this weekend!).

The framework for the CBIS has been evolving in concert with the School's strategic plan, *Translating Discoveries*, which, when it was developed over six years ago, envisioned the Stanford Institutes of Medicine along with several crosscutting strategic centers (including biomedical imaging, clinical informatics and genetics and genomics). The centers are at different stages of development, the most advanced being Clinical Informatics (see: <http://clinicalinformatics.stanford.edu/>). Efforts to develop a center for imaging extends back several years (see: http://deansnewsletter.stanford.edu/archive/10_04_04.html#1) and has been under active study for the past year thanks to the efforts of Drs. Hans Ringertz and Gary Glazer from the Department of Radiology. The vision for the CBIS is "to provide the resources and interdisciplinary networks to ensure that Stanford remains at the leading edge of imaging science." Despite the remarkable success of the imaging community at Stanford (which extends across the university) it is clear that to sustain leadership CBIS and Stanford will need to provide educational and networking opportunities for all groups on campus that use or have an interest in imaging applications.

To help elucidate a path forward, a nine-month planning effort was recently led by Dr. Ringertz, a visiting professor from the Karolinska Institute, and has resulted in a draft proposal. A part of this effort involved gathering input from faculty across the university about research imaging needs and requirements. Of the 1306 faculty who received a questionnaire on this topic, 354 responded and highlighted interest in access to clinical and research imaging (including microscopy). Codifying perceived needs was one important facet of the work done by the planning group. Equally important was defining the already impressive scope of imaging activities and services at Stanford— which total more than 40 programs, centers, services or resources. One obvious conclusion of the planning group was the importance of providing a common website for Stanford faculty and students about already available imaging resources. I invite you to visit the recently developed website, which is quite informative (see: <http://cbis.stanford.edu/about/>). Accordingly, the CBIS is recommending a number of venues to provide greater connectivity to the Stanford community, including an Internet site, education programs and seminars as well as faculty and student alignments and seed programs – and facilities. We will be examining the recommendations of the CBIS to determine the best ways to support biomedical imaging at Stanford.

I want to thank Dr. Hans Ringertz again for his tremendous efforts during the past nine months as well as Dr. Glazer for his support. I also want to thank the faculty leaders and CBIS Advisory Board (see: <http://cbis.stanford.edu/people/#advisory>) for their efforts on this important project.

Update on the Department of Surgery

At a recent Executive Committee meeting, Dr. Tom Krummel, the Emile Holman Professor and Chair of the Department of Surgery and Susan B. Ford Surgeon-in-Chief at LPCH gave an update on the Department of Surgery. A summary of his remarks follows:

The Department of Surgery was founded more than 75 years ago with Emile Holman serving as its founding Chair. Holman was a Stanford grad (Phi Beta Kappa) and served as Secretary to President Jordan for three years. He was Stanford's 2nd Rhodes Scholar. Holman set a standard for faculty excellence to which we continue to aspire.

The Department consists of seven divisions including Anatomy, Emergency Medicine, General Surgery, Pediatric Surgery, Plastic & Reconstructive Surgery, Multi-Organ Transplantation and Endovascular/Vascular Surgery. There are currently a total of 78 faculty members and 123 residents and fellows. Each division maintains active clinical, research, and teaching functions. A full report is beyond the scope of this brief summary. Over the last 10 years there has been a 250% increase in the overall activity of the Department, and an almost 400% increase in sponsored research projects. Currently there are a total of 28 funded faculty with a total of 70 grants, and an estimated total cost of almost \$11.5M.

There are many ways to gauge the excellence of our faculty, important societal memberships is one of them. Currently 25% of the department faculty are members of the American Surgical Association. Nationally, less than 5% of faculty are members. Two department faculty are members of the American Society for Clinical Investigation, two have been elected to the Institute of Medicine and one to the American Academy of Physicians. Faculty members serve important leadership positions throughout the institution and throughout the nation.

It is fair to say that the standards of excellence set by Emile Holman, the founding Chair and by Stanford University are very much a part of the fiber of the Department of Surgery in 2008.

Reaffirmation of the Stanford Affirmation

At the May 21st meeting of the Medical School Faculty Senate, a proposal to revise the existing Stanford Affirmation was brought forth by the Stanford Medical Student Association. Matt Goldstein, President of SMSA, and Mitchell Lunn presented the proposed revisions, which were aimed at “modernizing” the text and addressing a number of omissions. After a thoughtful debate, the Senate recommended and I approved the following revised text for the Stanford Affirmation. This will be the version that will be read by our graduating students at Commencement on June 14th.

The Stanford Affirmation

On my admission to the Practice of Medicine

I pledge to devote my life to the service of humanity.

The care of my patients will be my first consideration.

I will strive to acquire and share new knowledge with my colleagues and my patients;
I will practice my profession with conscience and dignity, and to the best of my ability and judgment.
I will approach each patient with charity, attention, humility, and commitment;
I will hold all life dear, and let knowledge, wisdom, courage, and compassion guide my therapy;
I will use my medical knowledge and skills to promote human rights, social justice, and civil liberties;
I will not permit considerations of age, disease or disability, faith, ethnic origin, gender identity, nationality, race, sexual orientation, social standing or other forms of discrimination to intervene between my duty and my patient;
I will respect the confidences with which I will be entrusted;
I will give gratitude and respect to those from whom I have learned my Science and my Art;
I will uphold the integrity of the medical profession;
I will cultivate peace in both personal conduct and political expression;
I will not use my knowledge contrary to the spirit of this Affirmation.
I make these promises in witness of those who have stood here before me, and those who will come after,
Solemnly, freely, and upon my honor.

Honoring Outstanding Teachers

On May 27th we initiated a new tradition: the presentation of faculty recognition awards for education at a school-wide reception. Traditionally these awards have been announced at Commencement – and while that has a special significance, it does not permit the students who have voted for the faculty winners to participate in the celebration. As we did this year, we plan in future years to announce and celebrate these awards at a special recognition reception. We will of course still list them in the Commencement program. This year's award winners include:

Stanford University School of Medicine Award for Graduate Teaching

Susan McConnell, Biological Sciences, School of Humanities & Sciences

Stanford University School of Medicine Award for Outstanding Service to Graduate Students

Thomas Clandinin, Neurobiology

The Arthur L. Bloomfield Award In Recognition of Excellence in the Teaching of Clinical Medicine

Rebecca Blankenburg, Pediatrics

John Morton, General Surgery

The Henry J. Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education

Lisa Chamberlain, Pediatrics

The Henry J. Kaiser Family Foundation Award for Excellence in Preclinical Teaching

John Gosling, Surgery - Anatomy

Peter Pompei, Internal Medicine

Elliott Wolfe, Medicine

The Henry J. Kaiser Family Foundation Award for Excellence in Clinical Teaching

Paul Helgerson, Internal Medicine

Andrew Nevins, Medicine – Infectious Diseases

Erika Schillinger, Family Medicine

The Franklin G. Ebaugh, Jr. Award for Advising Medical Students

Stanley Rockson, Medicine - Cardiovascular

The Alwin C. Rambar-James B.D. Mark Award for Excellence in Patient Care

Bertil Glader, Pediatrics

The Arnold P. Gold Foundation Award for Humanism and Excellence in Teaching

Sarah Azad, Obstetrics and Gynecology

Monica Eneriz-Weimer, Pediatrics

Ahmir Khan, Neurology

Lana Schumacher, Surgery

Dan Sedehi, Internal Medicine

Jacob Towery, Psychiatry

Congratulations to each of our 2008 faculty educator award winners. Medical and graduate students choose nearly all of these awards, and they reflect the respect and appreciation of the Stanford community for each of these individuals. I also announced at the reception that, upon his retirement, we will be establishing the *Elliott Wolfe Award for Excellence in the Teaching of the Art and Science of Clinical Medicine*.

Honoring Dr. Larry Shuer

On May 28th colleagues and friends of Dr. Larry Shuer, Professor Neurosurgery, gathered in the Stanford Hospital and Clinics (SHC) atrium to celebrate and offer appreciation for his twelve years as the SHC Chief of Staff. Dr. Shuer served in this important role during a remarkable period of time – through the merger and then de-merger with UCSF, nursing strikes, financial challenges, leadership changes and many other events in the Medical Center. Throughout this time Dr. Shuer served most ably as a fair, balanced, clear-minded leader. He served as the hospital's spokesperson for both good and bad news, always representing the institution with dignity and respect. Accordingly, he won

the admiration and confidence of hospital leaders as well as the medical staff – many of whom joined in this celebration. Part of Dr. Shuer’s responsibilities included graduate medical education, and I am pleased that he will continue to have oversight over these programs even as he steps down from his position. This year the Chief of Staff position became an elected one with a term of two years. Thus Dr. Shuer’s 12 year term will go down in history as the longest on record – and surely one of the most distinguished and respected as well.

Additional Awards and Honors

- **Howard Hughes Medical Institute Awards:** It might be appropriate to refer to Stanford as HHMI West. With the announcement of 4 new Investigator awards (out of 56 that were offered) Stanford and MIT are tied for the largest number of HHMI Investigators in the nation. This is quite a distinction. The newly selected HHMI Investigators for Stanford University include:
 - **Seung Kim**, Associate Professor of Developmental Biology
 - **Mark Schnitzer**, Assistant Professor Biology and of Applied Physics
 - **Kang Shen**, Assistant Professor in Biology
 - **Julie Theriot**, Associate Professor of Biochemistry

In addition, we have also recently have received the terrific news that 10 medical students were successful in this year’s HHMI competition for research fellowship training. This too is a highly competitive process in which Stanford students have performed exceedingly well in the past several years. This year’s winners and their research mentors are:

Student	Mentor
<i>Paul Nuyujakian</i> , SMS 2	Krishna Shenoy, Electrical Engineering and Bioengineering
<i>Jennifer Chen</i> , SMS 4	Paul Khavari, Dermatology
<i>Angieszka Czechowicz</i> , SMS 2	Irv Weissman and Deepta Bhattacharya, Stem Cell Biology, Cancer Center and Pathology
<i>Michael Galvez</i> , SMS 2	Geoff Gurtner, Surgery and Amato Giaccia, Radiation Oncology
<i>Matthew Goldstein</i> , SMS2	Ron Levy, Medicine
<i>Jennifer Hong</i> , SMS2	Matt Scott, Developmental Biology
<i>Russ Huss</i> , SMS 2	Eugene Butcher, Pathology (at the VA)
<i>Gene Ma</i> , SMS2	Ching-Pin Chang, Medicine
<i>Jeremy Pearl</i> , SMS2	Mark Davis, ITI and Microbiology & Immunology and Joe Wu, Medicine
<i>Makeda Robinson</i> , SMS2	Ann Arvin, Pediatrics

- **Searle Awards:** The Searle Scholars program, which began in 1981, announced its fifteen 2008 Scholars selected from 176 applicants from 120 universities and

research institutions. One of the Searle Scholar Awards is to a Stanford junior faculty member:

- **Dr. Gill Bejerano**, Assistant Professor of Developmental Biology and of Computer Science
- **Burroughs Wellcome Fund Career Awards for Medical Scientists** named 16 winners for 2008, including two from Stanford:
 - **Dr. Ravindra Majeti**, Instructor, Division of Hematology, Department of Medicine
 - **Dr. David Tevis Pride**, Fellow, Department of Medicine
- **CASE Awards:** The Council for Advanced Support for Education (CASE) presented a number of prestigious awards to our Office of Communications and Public Affairs including:
 - *Gold Medal* for “Stanford Medicine” reflecting the leadership of **Rosanne Spector**
 - *Gold Medal* for news writing involving science and medicine
 - *Silver Medal* for best article – this being “Silent Inferno” by **Tracie White**
 - *Silver Medal* for visual design in print for the Spring 2007 cover on the health impact of global climate change by **Tomer Hanuka**
 - *Silver Medal* for “Code Green” by **Tomer Hanuka**
 - *Bronze Medal* for “War Rounds” in Stanford Medicine

Congratulations to our Office of Communications and the leadership of **Paul Costello** for these wonderful honors

- **Graduate Student Fellowship Awards**
 - **Paul Sigala**, graduate student in Biochemistry, has been awarded the 2008-2009 *Lieberman Fellowship at Stanford University*
 - The Office of the Vice Provost for Graduate Education announced the successful graduate students for the inaugural *DARE (Diversifying Academia, Recruiting Excellence) Doctoral Fellowship Program*. The DARE Fellowship is a two-year award for advanced graduate students who are planning academic careers and who will also help diversity academia’s professoriate. Of the 12 awardees at Stanford, three were in the medical school and included:
 - **Jessica Allen** (Immunology)
 - **Matthew Anderson** (Genetics)

Congratulations to all!

- **US News and World Report (USNWR)** rankings for “America’s Best Children’s Hospitals” named the Lucile Packard Children’s Hospital (LPCH) as the top children’s hospital in the Bay area and #12 in the nation. In addition, the Heart Program was ranked #5 and cancer program #10. These rankings were based on a blend of reputation, outcome and care-related measures including

volume, nursing and credentialing. Congratulations to the LPCH leadership and to the physicians and staff who have made such wonderful contributions to care of children.

- **Patricia Foo** (SMSI) has been awarded the Schweitzer Fellowship for 2008-09. The Bay Area Schweitzer Fellowship Program is a joint program between the University of California Berkeley, University of California San Francisco, and Stanford University. She will be developing a project on coordination of mental health services at the Opportunity Center in Palo Alto.
- The following students have been awarded Valley Fellowships for 2008-09. The Valley Fellowships are summer fellowships that provide students the opportunity to work on a focused, substantive project defined by the San Mateo and Santa Clara County community partners to strategically expand their capacity to meet their mission. Projects address health issues from a population perspective with a particular focus on health disparities and underserved communities.
 - **ChaRandle Jordan** (MD-PhD student)
 - **Christine Chang** (SMSI)
 - **Yi-Ren Chen** (SMSI)
 - **Narmadan Kumarasamy**(SMSI)
 - **Angela Venega** (SMSI)
- Three awards were presented to three groups of first year medical students at the Population Health Symposium on May 14th for Outstanding Population Health Project.
 - **Frederick Chris Bennett, Flynn LaRochelle, Sarah Pickard, Jessica Sin, and Chad Tang** for their project “Assessing the healthcare needs of transgender women in Santa Clara County” completed in partnership with Lydia Guel and the Community Health Partnership of Santa Clara County.
 - **Amanda Brosius Lutz, David Craig, Patricia Foo, Mariko Howe, Grace Huynh, Anna Lonyai, Liam MacLeod, and Michael Sundberg** for the project “The Farmers’ Market as a Health Intervention: A community-based model for integrating food system change and health services provision in urban communities” in collaboration with Wolfram Alderson and Collective Roots.
 - **Gregory Charville, Walter Igawa-Silva, Joanna Mattis, Nathaniel Myall, Christine Lee, and Daniel Winetsky** for the project “Mental Health Prevention and Early Intervention in a Primary Care Setting” with Lourie Campos of Community Health Partnership.

Appointments and Promotions

- **Scott S. Hall** has been appointed to Assistant Professor (Research) of Psychiatry and Behavioral Sciences, effective 6/01/08.
- **Justin L. Sonnenburg** has been appointed to Assistant Professor of Microbiology and Immunology, effective 6/01/08.

Dean's Newsletter June 16, 2008

Commencement 2008

On Saturday June 14th, in its Centennial year, the Stanford University School of Medicine held its commencement on the Dean's Lawn. This year 22 students received a Master of Science degree, 98 a Doctor of Philosophy and 96 a Doctor of Medicine degree. The accomplishments of this year's graduating class in science and medicine are truly outstanding and we are proud of each and every one of them. Their names are listed below along with their degree program and thesis and, for medical students, the residency program they will commence in the next days.

This year is special since it represents 100 years of Stanford Medicine. In the May 5th edition of this Newsletter I reflected on our past, present and future in my comments entitled "*Tradition or Transformation: Celebrating the Past or Creating the Future*" (see: http://deansnewsletter.stanford.edu/archive/05_05_08.html#1). Stanford has played – and will continue to play – a unique and transformative role in the worlds of science and medicine and in their integration. Past contributions by students and faculty have certainly been remarkable but now require a redoubled effort, as elegantly reflected by this year's Medical School Commencement Speaker, Dr. Roger Kornberg, Mrs. George A. Winzer Professor and recipient of the 2006 Nobel Prize in Chemistry.

I hasten to add that it took a lot of organizing, planning and hard work to have the Commencement events run so smoothly. Many thanks to Zera Murphy, Suzanne Bethard, Char Hamada and their team – Kristin Fabbro, Molly Aufdermauer, Joann Berridge, Jana Baldwin, Mira Engel, Lorie Langdon, Velissa Peairs, Erica French-Arnold, and Cass Sooter – for a job well done!

Graduate Student Speaker: Gilbert Martinez (PhD candidate in Biophysics)

I know I'm supposed to use my limited time to talk about graduate school, but I wanted to make sure I thanked some of the people who have made the Stanford school of medicine such a great place to work.

Over the course of my many, many, many years at Stanford I've had the opportunity to work with the Dean's office and can say with confidence that a big reason the School of Medicine is such a great place to be is because of Dean Pizzo and the work done by the

Dean's office. I'd also like to mention Ellen Porzig's tireless advocacy for graduate students. I greatly appreciate everything you've done for us. Our department administrators have contributed so much to making sure that we succeed without ever having to know about everything that goes on behind the scenes. Zera Murphy, Suzanne Bethard and many others have done a wonderful job getting this ceremony together. Thank you all.

I have to thank all the faculty who do more for each of us than we know. They have given their time, and spent a lot of money making sure we were able to be here today. I never cease to be amazed by the commitment the faculty has for their own students as well students not in their lab. I can't tell you how many times I've been stopped in the hall by a faculty member I haven't seen in years and be asked about my research. They must gossip about us as much as we gossip about them.

Finally, I'd like to thank all our friends and family who may or may not be here today. We would not be here without their constant support and encouragement. Thank you all so much. Now you no longer have to ask when we will be finishing.

Over the course of the last week, as I was pondering what to say, I realized that I'm supposed to come up here today and condense all of graduate school and talk about our futures in five minutes.

I wrote down a bunch of hilarious anecdotes, found some awe inspiring quotes that will motivate us all, and some tear-inducing stories that will get us all to reflect on what we've accomplished and what lies ahead. After seeing the pages and pages of notes I realized that I might not finish in the five minutes they said it should take. The whole experience was so reminiscent of graduate school. I was told it would take five, five and half years to finish. They were a wee bit off. I hope I am excused if I run a minute or two (or three) over. It is theoretically possible that I finish a minute faster, and I will do my best to make that happen, but we all know that some things are beyond our control.

I have to say that it's an honor to have my classmates select me to speak for them today. You all are such a talented and knowledgeable group. When I found out you had chosen me, it was a lot like my committee coming out of the room after my defense and telling me that I had passed. How did I fool so many brilliant people? You see, there are many parallels to giving this speech and to graduate school in general.

Of course, you could have chosen me to get back at me for all the emails I sent out as BioMASS chair. I was supposed to use the week after turning in my thesis to relax a little. Instead I was worrying about this speech. Again, just like grad school. Every time you think you're finally finished, something pulls you back in.

But it's worth it. I've enjoyed my time here at Stanford not only because the science is great and because of my colleagues. I'm always asked about advice that I have for first year students and the answer for me is always very simple: take advantage of your classmates. No, I don't mean always asking them for rides to the airport at 5 a.m., though sometimes that was necessary. Take advantage of their talents, their expertise, their quirks, their friendship, their conversations.

Looking around I can see just how right that advice is. You are smart, funny, shy, awkward, and ambitious. And you are all pretty good scientists. I know. I've been to some of your talks or talked with you about your research. I've learned so much from so many of you. And we've all learned from each other. We helped teach each other how to run the perfect Western. We shared our secrets on how to record from cultured neurons or how to program in Perl. But we've also learned how to salsa dance together, how to snowboard, how to rock climb and many other hobbies we've picked up along the way. And perhaps, most importantly, some of us have helped each other learn how to function at 2 a.m. after a night out at the Nut House or the BBC.

When I look back at our time here, it's clear that we learned a lot. We learned a lot about science and a lot about ourselves and each other. But, personally, it's the friendships and relationships that I developed that I will remember most fondly. From the BioMASS first year camping trip, to the late night study session and practicing for our quals and our defense, we created friendships that will last our lifetimes. During my second year at Stanford, I had the opportunity to follow my original adviser to San Diego. I chose to stay and because of you, I'm glad I did.

Now that we are finished we will be going our separate ways. Some of us will go on to have successful careers in academia. Some of us will run far away from bench science as fast as we can. But we are all scientists and experts in our respective fields. Few know the awesome potential that the future of science holds than us.

Unfortunately, there are many challenges facing science today. Those of you pursuing the academic route will soon learn how hard it is to receive funding. Those of you working with stem cells know the hoops you have to jump through to do some of your science. Every year tens of millions of dollars are spent trying to confuse people about the basic principles of evolution. Many of us are hoping that this will all change in January of 2009. But there is to meaningful change, we must all take a more active role in protecting the future of science. There are many little things that we all can do. A letter to the editor or to our political leaders can go a long way to inform people of our challenges. We can spend a morning or an afternoon answering questions from school children. Or even informing our friends and family about science. As we leave here today, I hope that we all do a small part to make sure that current and future scientists will be able to fulfill the full potential of all the work we have done over the last several years.

Medical Student Speaker: Graham Walker

Good Afternoon Dean Pizzo, family and friends, colleagues, The Guy Who's Totally Uploading This To YouTube Right Now, The Undergrads Who Heard There's Free Alcohol Afterwards, and of course, my fellow classmates, the Graduating Class of 2008,

Britney Spears once famously said, "Hit me baby—." That was my ORIGINAL version of the speech. You weren't supposed to hear that. Awk! Ward! Blarg. Wow. Uhm, okay. Let's just pretend that didn't happen.

Hannah Montana once famously said, "We. Need. Single-payer national health insuran—." Okay fine, she didn't. But, I'm kind of known for ranting about health care reform, so

everyone probably thinks that's what I'll talk about today. But don't worry. I won't. Today, I would like to talk about something that's been bothering me: name-calling.

During medical school (and my entire life) I've answered to just about any variation on the theme: Graham, Graham Cracker, Grahamazon, Grahambo, Grahamakin Skywalker, "Hey you," Kilo, Graham Stain, Graham Positive, Graham Negative, and even, as one attending who didn't care to learn the names of her students called me, "a medical student," with the same tone one might use to ask, "Could you hand me a pen?" Man, I'm really going to miss medical school!

But lately, most people have been calling me doctor, and I'm not sure if I like it. Sure, people have said it all throughout medical school, but I always had sufficient grounds to correct them: "No no, not yet, I've still got 6 more months to go," or "Gosh, I wish, but I still have to pass my boards!" But lately, I haven't had a leg to stand on.

It's almost as if I don't want Graduation Day to be here. But too late now. Change happens. Today, we're becoming doctors.

I remember at orientation an upper-classman saying that we probably thought *becoming a doctor* was a noble, selfless act—but any of you in the audience can easily vouch for how selfish it can be. We have demanded your patience, love, understanding, compromises, and support for all these years. So up front, I want to say to each of you, from all of us up here, I am sorry. But I promise to do better next time. Not to forget slash have to reschedule: your birthday, our anniversary, the dinner reservations we had, or that trip to Mexico.

But truly, we could not have made it this far without you. Not to get all Mr. Rogers on you, but to us, you are special. You are why we are dedicated to this: because our patients have their own families and friends like you. You are the selfless ones...not us. So from the deepest reaches of our hearts and souls, thank you so very, very much. Today, we celebrate becoming doctors as much as we celebrate you.

I guess I really worry about how the title of Doctor defines you. How it changes you. That I'm becoming a little bit more Doctor Walker, and a little bit less Graham. Sure, the title affords me some prestige and privilege—for example, complete strangers will now feel totally comfortable whipping out their strange moles at dinner parties—but at the same time, it makes people see me as primarily—or only—a doctor, not as a son, brother, partner, computer nerd, or Trader Joe's enthusiast.

Maybe this is how it's supposed to be. Maybe that's the purpose of the title. To remind us and others of the Oath we take, or that patients' needs are to come before our own.

But if becoming a doctor will change how people view me, there are several values I've learned here at Stanford that should get to represent me, too. And I have numbered these values, as I am going into Emergency Medicine, and have a short attention span. Oh, and just a sidebar: The next time you want to complain about your hospital's Emergency Department, please remember that we're probably getting distracted by... oh, I don't know, coding patients, big traumas, (mumbling) bodily fluids being flung... at... us, or... shiny... things.

Sorry. Back to my values:

Number one: I will continue to use objectivity, without forgetting the subjective.

Medicine is an art grounded in science. I'll do my best to know the studies, the data, and the pathophysiology, and try to apply them objectively.

But I won't forget the patient. I'll listen. I'll be compassionate. I'll try to keep social context, "chief concern," and patient perspective in mind.

And number two: I promise to ask questions, and on occasion dare to admit: "I don't know." And thank you to Stanford for encouraging this—in Gil Chu's class, where we weren't allowed to leave until we had collectively asked him 10 questions; with Dr. Wolfe, who teaches students to admit their own "Areas of Ignorance." We are a generation of physicians who are unfortunately (or fortunately) still human. We are not gods. We still make mistakes, and we still don't have all the answers. But, hopefully, we'll know where to find them.

Number three: Don't mess with the pancreas. Or, in the famous words of master pancreatic surgeon Dr. Norton, "I'm tellin' you, don't mess with the pancreas! You gotta believe me!"

And number four: I promise to be involved. Whether it's researching, teaching, advocating, or volunteering, I will remember that health and medicine are often advanced and affected more by time spent outside a hospital than within one.

While passing clerkships and boards and memorizing facts may make us doctors today, it's our values that will drive us to become great doctors, like the many we have met here at Stanford. Because the great physician is dedicated to the truth, but also to patient. She is a scientist, but also a healer. He tempers prognosis with hope. I think Kurt Vonnegut sums up medicine's curiosity and compassion better than I ever could: "We are here to help each other get through this thing, whatever it is."

So, today, fellow classmates, this is it, for better or worse. When our patients call us doctor, they'll finally be right. (How scary is that?) While our profession may change how we see the world, or even how the world sees us, we must keep a part of ourselves the same. That part—our goals and our values—is what has gotten us to this point, up on this stage. You can call me Dr. Walker now, but I promise to remain just Graham. I'm too proud of each title to be dropping either anytime soon. Thank you.

**Commencement Speaker: Roger Kornberg, Mrs. George A. Winzer Professor in
Medicine and 2006 Nobel Laureate**

Dean Pizzo, members of the faculty, families, friends, and most of all, class of 2008.

It is a privilege to speak on this occasion and to offer some observations on our profession and our times.

Many of you will be aware, from the signs posted all around, that this is not only a special year for the graduates of Stanford Medical School, but also for the school itself, the 100th anniversary of its founding. What fewer may know is that modern medicine, or more particularly, medical science, is only about 100 years old as well. Little over a century ago, disease was attributed to an imbalance of humours, and the only treatments were bleeding and violent purgatives. Medical schools were trade shops funded by fees from the students, who gained licenses to inflict their ignorance on the general population. Change began in Europe in the latter part of the 19th century, with the germ theory of disease and the work of Pasteur, Koch, Ehrlich, and others. Charles Eliot, then president of Harvard, was aware of these developments and of the appalling state of American medical education, and proposed to introduce medical science in the curriculum at Harvard medical school. The most powerful member of the faculty objected "Eliot actually proposes to have written examinations for the degree of doctor of medicine. I had to tell him that ... more than half of [our] students can barely write...No medical school has thought it proper to risk large existing classes and large receipts by introducing ... rigorous standards." Dean Pizzo assures me all of our graduates today can read and write. And all our graduates are imbued with the spirit of what followed in the 20th century, the rise of medicine from roots in science, from exploration in all fields from physics to biology.

If I were to ask members of this audience what were the most important advances in medicine during the 20th century, most would make a similar list: X-rays, for both diagnosis and treatment; antibiotics, which have largely eradicated bacterial disease; cell culture, which led to the polio vaccine; noninvasive imaging, especially magnetic resonance imaging, or MRI, for early detection of cancer and other conditions; genetic engineering, which is the basis of most new medicines; the list could go on. These medical advances have one thing in common: they were all discoveries made in the pursuit of knowledge for its own sake, with no idea of any application, no purpose in the prevention or cure of disease. The lesson of the past is counterintuitive: to solve a difficult problem in medicine, don't study it directly, but rather pursue a curiosity about nature and the rest will follow. Do basic research.

The success of medical science has become, in a way, its undoing. We are dazzled by the knowledge we have acquired and rush to apply it to medical problems. This is understandable but often premature. Take the human genome, the true font of medical knowledge. It's all there, the answer to every question about human biology. The trouble is the answers are written in a language we don't understand. It is a multidimensional and dynamic language. The products of the genome, both protein and RNA molecules, interact with one another and with the genome itself in a dance of dizzying complexity. At present, we can only dimly perceive the significance. We can grasp a tiny fraction of one percent of what there is to know and understand. Just imagine, if the medicine of today flows from this tiny bit of knowledge, how much more would be possible if we knew the remaining 99 percent. What more persuasive call to the pursuit of basic research can there be?

And yet this call is often unheeded. Traveling across the US and abroad, I'm disheartened by a shift from research to application. It's ironic. Just as the lesson of the past century is learned, it is forgotten.

This is not only a scientific but also a political problem. The support of basic research has traditionally come from government rather than the private sector, and for good reason. The timeline is very long – basic problems take decades to solve. Only the public, with a lifelong interest, will support such an undertaking. Industry, with a short-term interest and eye on the bottom line, can hardly be expected to do so. What CEO could report to his or her Board that a major investment has been made in research that may or may not become profitable in 10 to 20 years, or longer? Let me give you a specific, disquieting example. Pharmaceutical companies developing anti-cancer therapies are regularly forced to choose between a drug that cures cancer with a single dose and one that must be administered weekly and which only prolongs life by a year or two. Management invariably makes the right decision on behalf of shareholders, and pursues the less effective drug. This is not an isolated or rare occurrence. It occurs on a weekly basis. Government clearly has a special responsibility and a unique role to play.

Our government has performed this role admirably in the past. Some fifty years ago, in perhaps the most farsighted action of any legislative body in history, the US Congress began funding basic biomedical research. The investment has been repaid many times over. How many people do you think were crippled or died of polio last year in the US? The answer is virtually none, due of course to the polio vaccine. Imagine the savings in treatment and productivity, not to mention human suffering. Not only has the investment in medical research been repaid, but it was small to begin with. The annual budget for cancer research today is only \$5 billion, less than 10% of our annual expenditure on soft drinks, less than a week of the war in Iraq. And yet, despite its small size, this budget has been cut repeatedly over the past decade. At a time when medical science is poised for the ultimate payoff – the cure of cancer and other dread diseases – many promising leads are being abandoned.

Finally you may ask what does all of this have to do with Stanford and the class of 2008? The answer is leadership. Stanford Medical School has shown the way in American medicine because of a decision about fifty years ago to focus on basic science. Our medical school owes its pre-eminence in large part to achievements in this area. Today, in the face of retrenchment worldwide, Stanford must rededicate itself to basic science. What was good for Stanford and others before will be even better in the future. Stanford must continue to lead.

And you, the class of 2008, have the most important role to play. You have received the best possible education in medical science. Let it guide your professional lives. Let your practice of medicine be not only compassionate but also productive of new knowledge. Do research. Advocate for it. Yours is the legacy of 100 years of Stanford medicine and of American medical science. You will be the ones to carry it forward, to instill it in others, and to realize our hopes and dreams for the betterment of the human condition.

Awards and Honors

The following students have received prestigious and highly competitive fellowships for 2008. Congratulations to all!

NSF:

Sadie Bartholomew (Biochemistry)
Cecil Benitez (Developmental Biology)
Jeremy Chang (Chemical and Systems Biology)
Shuai Chen (Cancer Biology)
Regina K Cheung (Immunology)
Edward Chuong (Genetics)
Karen Colbert (Structural Biology)
Dan Dickinson (Cancer Biology)
Antonia Dominguez (Genetics)
Vivian Ericson (Developmental Biology)
Jeanine Frey (Cancer Biology)
Richard Gaster (Bioengineering and MSTP)
Kira Irving (Neurosciences)
Max Jan (Cancer Biology)
Jonathan Karr (Biophysics)
Erik Lehnert (Genetics)
Grace Lin (Genetics)
Jordan Nechvatal (Neurosciences)
Jordan V Price (Immunology)
Jehnnna L Ronan (Immunology)
Jayodita Sanghvi (Bioengineering)
April Weissmiller (Neurosciences)

NIH:

Max Banko (Genetics)
Melanie Bocanegra (Cancer Biology)
Justin Brown (Neurosciences)
Brittany Burrows (Neurosciences)
Erika Bustamante (Developmental Biology)
Dan Calnan (Cancer Biology)
David Chen (Biomedical Informatics)
Thomas Jerde (Neurosciences)

NDSEG

Melanie Bocanegra (Cancer Biology)
Catherine Del Vecchio (Cancer Biology)
Anna Guan (Cancer Biology)
Jonathan Karr (Biophysics)
Michelle Zeman (Cancer Biology)

Ford Foundation

Tiffany Williams (Cancer Biology)

Paul & Daisy Soros:

Amit Kaushal (Biomedical Informatics)

ASM/Robert D. Watkins

Justine Pompey (Microbiology & Immunology)

HHMI Gilliam

Shoa Clarke (MSTP)

Mason Case

Christina D Swanson (Immunology)

Michael Wong (Immunology)

Matthew Carter, doctoral candidate in the Neuroscience Program, was awarded a Walter G. Gores Award for Excellence in Teaching, at this year's University Commencement. The Gores Award is the University's highest teaching honor. He was recognized for, among other things, conceiving, planning and teaching the popular and highly regarded course *Understanding Techniques in the Neurosciences*, conveying difficult material in a succinct and accessible way, the infectious energy and creativity he brings to the classroom, and his engaging and exceptional skill as a teacher.

Yingbing Wang, MD, is the recipient of the Norman Blank Award, given by the Department of Radiology in recognition of outstanding performance in radiology or radiology research.

Gilbert Martinez, PhD, is the recipient of the BioMASS Award for Outstanding Service on Behalf of Graduate Students.

Mandar Deepak Muzumadar, MD, has been named this year's winner of the Allen B. Barbour Award for Excellence in Internal Medicine.

Congratulations to all!

Appointments and Promotions

- ***Sally Arai*** has been reappointed to Assistant Professor of Medicine (Blood and Marrow Transplantation) at the Stanford University Medical Center, effective 6/01/08.

- ***Daniel T. Chang*** has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 6/01/08.
- ***Kristen N. Ganjoo*** has been reappointed to Assistant Professor of Medicine (Oncology) at the Stanford University Medical Center, effective 8/01/08.
- ***Michael Grecius*** has been appointed to Assistant Professor of Neurology and Neurological Sciences, effective 6/01/08.
- ***Amreen Husain*** has been promoted to Associate Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 6/01/08.
- ***Sun H. Kim*** has been appointed to Assistant Professor of Medicine (Endocrinology, Gerontology and Metabolism) at the Stanford University Medical Center, effective 6/01/08.
- ***Denise M. Monack*** has been appointed to Assistant Professor of Microbiology and Immunology, effective 6/01/08.
- ***Kari C. Nadeau*** has been appointed to Assistant Professor of Pediatrics (Pulmonary) and, by courtesy, of Otolaryngology – Head and Neck Surgery at the Lucile Salter Packard Children’s Hospital, effective 6/01/08.
- ***Maxence V. Nachury*** has been appointed to Assistant Professor of Molecular and Cellular Physiology, effective 7/01/08.
- ***Andrew R. Zolopa*** has been reappointed to Associate Professor of Medicine (Infectious Diseases) at the Stanford University Medical Center, effective 7/01/08

Dean's Newsletter

July 7, 2008

Welcome to New Residents, Fellows – and Summer Students

With Commencement just a couple of weeks ago (see:

<http://deansnewsletter.stanford.edu/#1>), most of the university is on summer session. And while summer brings a pause to the rhythms of most of the university, it heralds new activity for the medical center. During the past days 905 residents and clinical fellows commenced their training in one of the 77 ACGME (Accreditation Council on Graduate Medical Education) training programs at Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCCH). I extend a welcome to each of these important members of the Stanford community along with those commencing their research postdoctoral fellowships in one of our laboratories or programs.

While we often feature the accomplishments of our medical and graduate students (appropriately so, of course), individuals pursuing graduate medical education (residents and clinical fellows) and postdoctoral fellowships also play incredibly important roles in the life and success of Stanford Medicine. In addition to being informed learners they are also a source of knowledge and expertise to students as well as our faculty, they provide care and service to our patients, contribute to the advocacy efforts of our institution, and are often the central players in advancing our mission in research. Their work is incredibly demanding and while the ACGME has limited this to 80 hours per week for residents, their contributions transcend time as a metric. Indeed without our residents, clinical fellows and postdocs, we simply could not be a leading academic medical center and research-intensive school of medicine. It is also important to remember that each of these individuals has already invested many years in developing her or his knowledge and skills in medical and graduate school, and they join Stanford to further their personal pathways to success in clinical medicine and research. We wish each the greatest of personal and professional success. Welcome to Stanford!

During the past couple of weeks, we also have welcomed gifted high school and college students who will spend the summer at Stanford – hopefully as a prelude to their future careers in science and medicine. Among these are the students joining the Stanford Medical Youth Science Program led by Dr. Marilyn Winkleby (Professor of Medicine), the Stanford Institutes of Medicine Summer Program led by Dr. PJ Utz (Associate Professor of Medicine), the Stanford Summer Research Program/Amgen Summer Scholars Program led by Dr. Ellen Porzig (Associate Dean for Research and Professor of Developmental Biology) and Anika Green (Assistant Dean for Graduate Education). We also welcomed a group of incoming medical students who joined the Early Matriculation Program led by Dr. Fernando Mendoza (Professor of Pediatrics). Each of these programs brings talented high school, college and new medical students for a summer experience that will hopefully be exciting and even transformative.

So while the rest of the university takes a summer pause, the Medical School and Medical Center begins another cycle of revitalization, welcoming students, residents and fellows who begin their time at Stanford and who add to the excellence and success of our

institution. Please join me in welcoming them – and, of course – in wishing them all great success in their endeavors.

Dr. Beverly Mitchell Will Become Director of the NCI- Designated Stanford Cancer Center

On August 1st Dr. Bev Mitchell, George E. Becker Professor of Medicine and Deputy Director of the NCI-Designated Stanford Cancer Center, will assume the role of Director and Principal Investigator. Dr. Irv Weissman, the Virginia and DK Ludwig Professor, has served until now as the Director of the Cancer Center, the Ludwig Center at Stanford, and the Stanford Institute for Stem Cell Biology and Regenerative Medicine. Given the remarkable and unprecedented growth of the stem cell programs at Stanford (see below) , and the growth of the Ludwig Center, which is mainly involved in cancer stem cell discovery, diagnosis, and therapy, Dr. Weissman requested that he be permitted to step down as Director of the Cancer Center so that he can focus his energies on the Stem Cell programs and the Ludwig Center. At the same time, he agreed to remain a senior scientific advisor to the Stanford Cancer Center , and will continue to be involved in its fundraising efforts,- which is, of course, wonderful news.

Dr. Weissman also recommended that Dr. Mitchell assume the role as Director and I am pleased to say that she has agreed to do so. The National Cancer Institute and the Stanford Cancer Center's External Advisory Board have also enthusiastically supported this recommendation. Please join me in thanking Dr. Weissman for the critically important role he provided as Director of the Cancer Center – which proved instrumental in achieving NCI designation. And also please join me in congratulating and thanking Dr. Mitchell for her willingness to assume the role as Director at this most important time in the history of the Stanford Cancer Center. Since joining Stanford Dr. Mitchell has been instrumental in moving our cancer agenda forward. She has worked tirelessly and successfully on behalf of our faculty and students and has won wide respect and admiration throughout Stanford as well as nationally. I am enormously pleased that she will take on these new and critically important responsibilities.

A Different Door to NIH Advocacy and Support

Over the years I have written frequently about the NIH and the importance that it has played in helping our nation to be the world leader in the biosciences. I have also increasingly commented on how that position of global leadership is now threatened because of the serious lapses of funding for research that have characterized the past several years and that threaten to continue in the years ahead. And, of course, I have highlighted the efforts that others and I have put into championing the importance of the NIH and biomedical research to the Congress and the importance of their bi-partisan support. This theme was echoed in Dr. Roger Kornberg's commencement address on June 14th (see: <http://deansnewsletter.stanford.edu/#1> and <http://med.stanford.edu/commencement/>).

Having spent some 23 years as an intramural investigator at the NIH, I am also quite cognizant of how members of Congress resonate to the impact the NIH has in their home communities and states. And even when they recognize that it is the great discoveries

made by NIH supported investigators around the nation that truly shape the discovery and innovation agenda of the USA, they are also touched by the human stories of their constituents who have benefited from a research discovery that helped treat or cure a serious disease. Those experiences make evident to Members of Congress why research is so important and why the NIH is the essential resource to making that happen. And this is something that crosses traditional political party lines and which in the past has resulted in the NIH being widely viewed as the “jewel in the crown” of government agencies.

I also learned the importance of patient advocacy in promoting the value of the NIH as a (much younger) investigator on the Pediatric Branch of the National Cancer Institute. I was reminded of this on June 25th when I attended the 20th Anniversary of the Founding of the Children’s Inn at the NIH that was held at the National Building Museum in Washington, DC. This gala celebration was attended by many dozens of Members of the House and Senate along with numerous Washington dignitaries and guests. It was an event that brought back many memories and lessons since my wife Peggy and I first conceived the idea of the Children’s Inn nearly three decades ago.

The idea was simple. Children, accompanied by their families, came to Bethesda to participate in clinical research protocols sponsored by the NIH. The vast majority of these children had cancer and since I was working on the pediatric oncology service at that time, I witnessed nearly every day the impact that separation from home and community had on these children, many of whom spent weeks to months in Bethesda, housed in motels with few amenities or emotional support for them or their families. This seemed both unfortunate and inappropriate and there was need of a creative solution. A child advocate and policy leader, my wife Peggy agreed that we might be able to do something for these families by advocating for a “home” on the NIH campus that would house these children and families who traveled from all over the USA and world to participate in clinical research and treatment. Because such a facility would provide emotional and physical comfort it made sense that the NIH would embrace this concept as an alternative to the then practice of contracting with local motels to house these children while they were coming to the NIH. Or so it seemed.

Together with my colleagues in pediatrics in the NIH Clinical Center we put together what we felt was a compelling proposal but despite numerous and repeated attempts we failed to gain any traction with the NIH leadership. It was a good idea – but just not a priority. Virtually every angle was tried but the bureaucracy was impenetrable. And then serendipity opened a door.

In the mid 1980’s we were investigating the role of bone marrow transplantation and intensive chemotherapy for children and adolescents with sarcomas. Among these patients was a teenage girl who, like others, felt separated from her home community. The impact of those challenges was quickly appreciated when she was visited by a woman named Carmela Walgren. It turned out that this teenage patient had been the babysitter for Mrs. Walgren’s own children. When Ms. Walgren shared her concerns about the social isolation of this young patient with our Head Nurse, who was both aware

and engaged in our efforts to get a home for children at the NIH, she called me to meet with Ms Walgren. After a couple of visits Mrs. Walgren, who turned out to be a Congressional spouse, indicated she would help. And indeed she did. She first united with two other Congressional spouses, Debbie Dingell and Chris Downing, and through their networks and contacts, they accomplished what had been previously impossible. After a call from the Congress, the NIH Director pledged to provide land for a Children's Inn at the NIH. A major breakthrough. Indeed together they not only moved mountains – but also the “Congressional Hill!” But then came the next challenge – how to find the sources to build what would become the Children's Inn.

Fortunately, further contacts gained access to Dr. Roy Vagelos, one of the most extraordinary leaders in American medicine and science, who was then the highly successful CEO of Merck. When presented with the idea, he embraced it immediately and, thanks to his stewardship, the Merck Foundation provided the funds to construct the Children's Inn at the NIH – which opened its doors in 1989. Those of you who have visited the NIH campus may have seen the Children's Inn – but perhaps have not recognized what it was, or the impact that it has had on the NIH. Located near the Clinical Center and recently expanded, the Children's Inn has provided service to over 6,000 children and families from throughout the world during their participation in research protocols in Bethesda.

When I spoke at the Gala last week, I reflected how the Children's Inn has been an important partner to the basic research agenda of the NIH. I noted that when we began planning for the Children's Inn, HIV and AIDS had not been recognized as a problem. By the time that the Inn was opening, we were carrying out research protocols in HIV infected children from throughout the USA. The Inn made it possible for our research group to study many hundreds of children who participated in research protocols and, as a consequence, rapid and tremendous strides were made in the treatment of pediatric AIDS – benefiting children all around the world. These successes, of course, were built on the early studies of retroviruses and some of their key enzymes, reverse transcriptase and protease, that became successful targets for antiretroviral therapy. Indeed basic research that did not anticipate the future emergence of AIDS created the fundamental knowledge that led to some of its solutions. And the Children's Inn became a vital partner in that collaboration.

During the past two decades, many members of Congress, their spouses and friends have gathered each year to help raise funds for the operation of the Children's Inn. In doing so, they are reminded of the value of the NIH and its impact on discovery, innovation and treatment. And while the beauty and elegance of new knowledge is a fitting testimony to the importance of the NIH, the Children's Inn puts a face on some of that knowledge – and helps inspire our Congress to stand behind support for basic research. This is also worth celebrating. And it certainly provides another door for advocacy about the importance of the NIH.

Service Satisfaction Survey Results

In March of this year, our faculty, staff and students received a survey conducted by the Institutional Planning Office to evaluate the services of 19 administrative functions provided by 10 offices within the School. Of the 3,223 individuals receiving the survey, 41% or 1,336 responded. The respondents included faculty (35%), students and trainees (25%) and staff (40%). The offices included in the survey were:

- Academic Affairs
- Communications and Public Affairs
- Facilities Planning and Management
- Finance and Administration
- Health and Safety
- Human Resources
- Information Resources and Technology
- Institutional Planning
- Research Management Group
- SPCTRM

The results of the survey showed a high degree of satisfaction and were very encouraging. Overall satisfaction with the services included in the survey was 4.2, on a scale of 1 to 5, with 1 as “Very Dissatisfied” and 5 being “Very Satisfied.” The areas of satisfaction measured in the survey included: Responsiveness, Efficiency, Quality of Work, Interaction, Proficiency and Expertise, and Overall Response to Your Needs. The range of results for these six areas averaged 4.02 (on “Efficiency”) to 4.33 (“Interaction”). We also analyzed the results individually for each Office. The individual office scores ranged from 3.67 to 4.66. We are pleased that the results were positive in most areas, but also wish to improve upon these results. Answers to the open-ended questions on strengths and weaknesses were especially helpful in assisting each group in devising an action plan to enhance services in the weaker areas.

Each office was asked to submit their action plan to the Senior Associate Dean for Finance & Administration, Marcia Cohen. Examples of some of the action plans proposed include:

- Establishing response time standards
- Improving workflow and business process to address efficiency
- Communication plans to educate “customers” about services, roles, and responsibilities
- Additional, focused surveying to pinpoint specific issues
- Develop audit protocols to identify problems
- Add FAQs to websites

We anticipate repeating the survey and measuring areas of improvement (or otherwise) on a regular basis moving forward. Many thanks to all for your participation; your responses were invaluable in helping us to assess our effectiveness, and we intend this feedback to be acted upon successfully over the next several months.

Success in Stem Cell Research Continues

June has been another exciting month for stem cell research at Stanford. The Land & Buildings Committee of the Board of Trustees voted for partial construction approval for the Stanford Institutes of Medicine 1 (SIM1) building that will serve as the future hub of Stanford Institute for Stem Cell Biology and Regenerative Medicine. With that approval, construction for SIM1 is beginning this summer. Final construction approval is expected at the October Board of Trustees meeting and with that, we should be on track for the completion of SIM1 by the summer of 2010. As you will recall, an important source of funding for SIM1 is from the California Institute of Regenerative Medicine (CIRM) which awarded Stanford \$43.5M – the highest of any institution in California (see <http://med.stanford.edu/mcr/2008/cirm-0514.html>). I will have further announcements about contributions to SIM1 in the next weeks.

Stanford also continues to be the leader in research funding from CIRM. On June 27th, the Independent Citizens Oversight Committee (ICOC), the governing board of CIRM, of which I have been a member since 2004, awarded another \$24M in research funding for two programs: the development of new lines of pluripotent human stem cells and planning grants for research teams that will compete for subsequent disease planning grants later this year. Indeed, Stanford faculty successfully competed for four of the 16 new cell line awards (including Drs Julie Baker, Michele Calos, Mike Longaker and Renee Reijo Pera). In addition, two Stanford faculty (Drs. Tom Rando and Bobby Robbins) competed successfully for two of the 22 disease planning grants. Overall Stanford faculty will receive \$5.6M – again the highest amount of any institution in California (see http://med.stanford.edu/news_releases/2008/june/CIRM.html). This is wonderful news and I offer my congratulations to each of these faculty members. Recognizing the importance of the future disease grants, the School also funded four pilot awards with internal resources in late 2007.

Clearly it is our faculty and students who are setting the agenda for stem cell research at Stanford. But thankfully we will soon have a new home to house them in as well. Given the paucity of funding for stem cell research through the NIH, these awards and their impact on this important field of science are all the more critical – thanks to CIRM and the citizens of California. Without this support and these efforts, the USA would be at great risk for losing its prominence in this area of research. Thankfully CIRM and California scientists are working hard to not allow that to happen.

Continuing the Discussion about USMLE Step One

Exams and metrics can shape the agenda of institutions and people. Consisting of “three steps,” the United States Medical Licensing Examination (USMLE) has had both primary and secondary effects on medical education and training. Established as a licensing exam, the USMLE has had a much wider impact – some intended and some inadvertent. Just as the Medical College Admissions Test (MCAT) plays an intended role in setting the agenda for premedical education, it also impacts the course of study of many

undergraduates interested in a career in medicine. Similarly, The USMLE has assumed importance beyond its role in licensing *per se*, since it is used as a screening exam for some of the most competitive residencies in the USA. Thus when it became apparent some months ago that significant changes were being planned for the USMLE (see February 25 2008 Dean's Newsletter - http://deansnewsletter.stanford.edu/archive/02_25_08.html#2) considerable concerns were expressed to the National Board of Medical Examiners (NBME) about possible changes in the USMLE. Most concerning was the proposed move of USMLE Part One to the third (traditional) year of medical school, along a perceived lesser emphasis on basic science knowledge, which could potentially undermine the importance of the scientific underpinning of medicine. Accordingly, along with a number of my colleagues in the Council of Deans and the Council of Academic Societies, serious concern was expressed about changes that had not been fully vetted and which could have significant and serious unintended consequences. Thankfully the National Board of Medical Examiners and USMLE agreed to engage in thoughtful dialogue before proceeding with any changes. This commitment was codified in (see <http://www.nbme.org/programs-services/medical-students/news-updates.html>) and was the topic for a discussion that I participated in along with members of the AAMC and NBME at a meeting in Philadelphia on June 30th.

While the discussions will be ongoing, the good news is that there is a clear recognition of the importance of basic science education and the importance of demonstrating knowledge and proficiency in its related disciplines. It was further acknowledged that this proficiency needed to extend throughout medical school (not just the “preclinical years”) and, in fact, to be continued through residency and continuing medical education. This is something we are currently already doing at Stanford. It was also acknowledged by the NBME that having a test of this basic science knowledge prior to beginning clinical education (defined as clinical rotations), was appropriate and that moving this later into the medical school curriculum was not the ideal. That said, the NBME wishes to also provide flexibility to medical schools which wish to pursue different curricula or areas of emphasis. At the same time it was recognized that the USMLE was also being used as a gatekeeper for competitive residency programs and that this may be an unintended consequence.

While there has now been a reasoned pause in the previously announced plans of the NBME to change the timing and content of USMLE 1, it was also clear that changes will occur over the next several years – as part of testing changes that will unfold over the next 10-15 years. Thus keeping a dialogue open and engaged is important and the NBME and AAMC agreed to do that – which is good news. If you have any thoughts or recommendations about this process, please do let me know.

2008 McCormick Faculty Awards

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2008 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research.

Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to Jennifer Scanlin in the Office of Diversity and Leadership at jscanlin@stanford.edu by 5pm on August 31, 2008.

Further information and details on how to submit your application can be obtained at: http://med.stanford.edu/diversity/faculty/08mccormickcall_apps.html. Questions can be directed to Claudia Morgan, Office of Diversity and Leadership (med.stanford.edu/diversity), at 650-723-2329, or at cjmorgan@stanford.edu.

Upcoming Events

Science Outreach Summer Lecture Series

Thursday evenings

7:00 pm

Cantor Art Center

Stanford's Office of Science Outreach invites the Stanford community and general public to campus this summer for four Thursday evenings filled with the wonders of art and science! Come in the late afternoon to visit the acclaimed Cantor Arts Center, then enjoy dinner at the Cool Café at the Cantor or bring a picnic. Settle into chairs that will be provided or bring your own lawn chairs/ picnic blankets and hear Stanford's top scientists talk about their research in terms you will understand. Lectures begin at 7:00 p.m. More information at <http://oso.stanford.edu/lectures.html>.

The 2008 lecture topics and faculty speakers include:

- July 10 – “Why is Earthquake Prediction So Difficult,” with Gregory C. Beroza
- July 24 – “Global Warming: Is the Science Settled Enough for Policy,” with Stephen Schneider
- August 7 – “Wired for Speech: How Voice Activates Interactions with People and Computers,” with Clifford Nass
- August 21 – “Powering the Future with Sustainable Energy,” with Stacey F. Bent

Skills Building Workshop: “Scientific Writing”

Thursday, July 17

5:30 – 7:30 pm

Always Building, Room M-112

The Office of Diversity & Leadership continues the Skills Building Workshop series with “*Scientific Writing*”, on July 17th with Michaela Kiernan, Ph.D., a Senior Research Scientist at the Stanford Prevention Research Center (SPRC) at the Stanford University School of Medicine. She received her PhD in social/health psychology from Yale University and has expertise in research methodology and statistics. Funded by the National Institutes of Health (NIH) and the American Heart Association (AHA), her research focuses on behavioral interventions for weight management, dietary change, and physical activity.

Registration is open to Instructors, Assistant and Associate Professors. Please visit the ODL website at <http://med.stanford.edu/diversity/> for details on registration and location as well as other events offered by the Office of Diversity and Leadership.

Appointments and Promotions

- James W. McCarrick III, has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 6/01/08.

Dean’s Newsletter

July 28, 2008

Welcoming New Faculty

The success of Stanford Medical School and University resides in the excellence, creativity and productivity of its faculty, students and trainees. Each year 50-60 new faculty join the Medical School community and bring new energy, ideas, talents and skills that advance science and medicine. While we remain small in the number of our full-time faculty compared to peer research-intensive schools of medicine, we have continued to grow over the past several years in relation to the rest of the university. Presently we have approximately 835 full-time faculty (i.e., Investigators and Clinician-Scholars/Investigators, who count against our current billet cap of 900) – along with approximately 250 clinician-educators. On July 8th, in conjunction with the Offices of Academic Affairs and of Diversity and Leadership, we hosted a Welcoming Breakfast for all the new faculty. Please join me in welcoming these new members of our Stanford community:

Fritz Beck	Surg/Vascular Surgery
Marion Buckwalter	Neurology
Daniel Chang	RadOnc/Radiation Therapy
Alan Cheng	Otolaryngology/H&NS
Glenn Chertow	Med/Nephrology
Craig Vance Comiter	Urology
Catherine Curtin	Surg/Plastic & Reconst Surgery
Dan Eisenberg	Surg/General Surgery
Stephen Felt	CompMed/Operations

Michael Fischbein	CT Surg/Operations
Scott Hall	Psych/Interdis Brain Sci Rsrch
David Hovsepian	Rad/Diagnostic Radiology
Dimitre Hristov	RadOnc/Radiation Physics
Hanlee Ji	Med/Oncology
Margrit Juretzka	ObGyn/Operations
Aya Kamaya	Rad/Diagnostic Radiology
Shelli Kesler	Psych/Interdis Brain Sci Rsrch
Sun Kim	Med/Endo
Allison Kurian	Med/Oncology
Maarten Lansberg	Neurology
John DeWolfe MacKenzie	Pediatric Radiology
Paul Maggio	Surg/General Surgery
Peter Maxim	RadOnc/Radiation Physics
Jesse McKenney	Pathology
Carlos Milla	Peds/Pulmonary Medicine
Denise Monack	Microbiology and Immunology
Maxence Nachury	Molecular & Cellular Physiology
Kari Nadeau	Peds/Allergy
Claude Nagamine	CompMed/Operations
Mark Nicolls	Med/Pulmonary & Critical Care
Hugh O'Brodovich	Peds/Operations
Kelly Ormond	Genetics

Faculty Salary Setting: The Process

I suspect that most faculty would be surprised by the degree of rigor and review that goes into establishing faculty compensation each year. I know that from time to time questions arise about equity, metrics and comparability of faculty compensation. I surely understand and appreciate the basis for personal concerns and thought it might be helpful to give you some context for the process.

All faculty compensation requires final approval by the Provost. In order to present well-considered recommendations to him, considerable effort and review take place at the departmental level and then within the Dean's Office. In fact, I personally review and make recommendations on each individual's proposed compensation in order to best advise the Provost as he makes his final decisions. How does this take place?

We begin the process in the Spring by asking department chairs to prepare compensation recommendations for each member of their department. This includes the base, variable, administrative and incentive (where applicable) components of the overall compensation. The data from each department are presented to our finance and compensation group based on departmental compensation plans. The Dean's Office then compares the proposed faculty compensation to national benchmarks, which are based on the nature of the clinical or research expertise and levels of responsibility. On the average, most faculty are paid between the 50-75 percentile of national benchmarks – which themselves can vary considerably in clinical specialties on a yearly basis. We examine the comparable compensation levels among faculty of comparable academic rank and area of expertise and take into account equity adjustments that are individually or departmentally justified. We also assess each faculty member's clinical and research productivity based on comments from the cognizant department as well as national quantitative benchmarks.

If a faculty member exceeds selected thresholds set by the University's Board of Trustees (in actual compensation or incentive pay levels), or is in a leadership position (e.g., department chair), we present a comprehensive analysis to the Compensation Committee of the Board of Trustees before the recommended compensation is approved. This additional process applies to less than 5% of our faculty. In selected cases, we seek guidance from an external consultant, who does an additional comparative analysis of

faculty at higher levels of compensation. As we review each individual's compensation we also determine whether the recommended level of merit performance or proposed incentive bonus is justified on the basis of performance and comparative metrics. In particular, I pay attention to equity for women and minorities in compensation levels – as well as for faculty across departments who are doing comparable work. For example, if a faculty member is doing predominantly research, we seek reasoned comparability regardless of whether that individual is in a basic or clinical department.

As you might imagine, this is a data-intensive review process. Since it involves reviewing over a thousand faculty members individually and comparatively, it also takes considerable effort and precision. As of this writing, we are completing the process and will be sharing more than five volumes of data and recommendations with the Provost's Office for final approval in anticipation of the academic year that begins on September 1st. I hope that this summary of the process gives you some comfort in the level of care that goes into reviewing and setting compensation for our faculty collectively and individually.

FY09 Budget Planning

Spring and Summer are also the times of the year when budgets are presented, reviewed and finalized throughout the medical school. This too is a major activity led by Marcia Cohen, Senior Associate Dean for Finance and Administration. The budget process starts with the development of financial plans by each of the basic and clinical science department, our Institutes of Medicine and Centers, and all administrative units. The Dean's Office Finance unit, led by Sam Zelch, CFO and Assistant Dean, Fiscal Affairs, reviews these budgets. They are then discussed at several meetings to ensure that the Dean's Office, the Chair, and the Director of Finance and Administration have a shared understanding of the plans for the department for the upcoming year and that the budget has been prepared with consistency, reasonableness, and rigor. As is nearly always the case, the requested needs for strategic investments exceed our sources, and thus a rigorous process is used to assess all requests, programs and opportunities. Of course priorities need to be established and the sources for their funding determined. At Stanford our major sources of revenues, in the aggregate, include sponsored grants and contracts, clinical revenue for professional and programmatic activities, tuition, gifts, and income from endowment.

The final stage of our budget process is the preparation of the consolidated budget, which rolls up all of our missions and activities for the next fiscal year (FY09), which begins September 1st. We also assess our annual budgets for program and capital against our ten-year financial plan. Given the scope of the transformational activities underway – and that will continue to unfold during the next 10-15 years – this level of planning is essential. As we finalize this process I will share some of the key conclusions with you in a future newsletter.

Given the increasing levels of economic uncertainty overall and the challenges we face in the support for research and, increasingly, for clinical activities, this level of financial

planning is even more essential than it has been in prior years. While we remain in a strong position overall, we want to do all we can to sustain and enhance this strength over the years ahead. This is especially true in light of the facility and capital programs that need to be completed as well as the importance of finding new funding sources to support our students and faculty, who face continued limitations in sponsored research support. Clearly this will be an ongoing process and dialogue.

No Smoking Policy Extends to Stanford Hospital & Clinics

In tandem with vaccines for a number of serious infections, among the greatest public health successes in the second half of the 20th Century was the recognition that smoking is responsible for a panoply of serious diseases. During the past decade, smoking cessation policies have been implemented in public buildings, restaurants and communities throughout the USA and, increasingly, in Europe. However, smoking remains a serious if not growing problem in Asia and developing nations. In August 2007 the School of Medicine created a smoke free campus as a means of further promoting the health of our community (see: http://deansnewsletter.stanford.edu/archive/05_21_07.html and http://deansnewsletter.stanford.edu/archive/07_09_07.html#6).

On August 1st, Stanford Hospital & Clinics will take a major step in also becoming a smoke free campus. Beginning on this date, smoking will be prohibited in all outside areas surrounding SHC except for a single designated area at the perimeter of the hospital at the end of the G-1 wing. Importantly, this means that smoking will no longer be permitted along the path in front of the hospital that connects to the Cancer Center. This is an important step and I appreciate the efforts of the hospital leadership in moving this forward. I also want to thank Dr. Rob Jackler, Professor and Chair of the Department of Otolaryngology and Head & Neck Surgery, and the medical staff for their advocacy in promoting this new policy. This is an important effort to promote the health of employees and patients. SHC also has made smoking cessation programs a priority for staff members through its Occupational Health Services.

Given the continuing rise of medical costs, it is imperative that the medical profession increase its efforts in promoting health and well being. Policies that restrict or limit smoking are important components of a pro-health environment.

The Stanford Health Improvement Program Celebrates 25 Years of Health Promotion

Speaking of promoting health, this year the Stanford Health Improvement Program (HIP) celebrates its 25th Anniversary. During the past quarter century HIP has contributed significantly to the Stanford community in promoting health resources as well as programs to address health challenges and wellness. These have ranged from tobacco cessation (see also above) to weight control, exercise and wellness coaching. HIP is part of the Stanford Prevention Research Center and offers classes, counseling and guidance in a variety of health and wellness programs. In addition to congratulating HIP on its 25th anniversary, I would strongly recommend that you review the HIP website

(<http://hip.stanford.edu/index.html>) and benefit from the resources they offer. Personal responsibility for health is essential and HIP can help you achieve some important milestones.

Comparative Medicine Now and Future

At the July 18th Executive Committee, Dr. Linda Cork, Professor and Chair, reviewed the history of the Department of Comparative Medicine. She noted that the department had campus wide responsibilities for laboratory animal care as well as responsibilities to the School of Medicine, individual faculty, and to society in providing for the welfare of animals used in research. Her report includes the following comments:

The Department of Comparative Medicine is a clinical department and has an Operating Budget and a Clinical Budget for the Veterinary Service Center (VSC). These two are separate and distinct: the VSC budget is treated as a “specialized service center” by the office of Management and Budget’s Circular A-21, it is non-profit, and must recover its costs from its users.

In recruiting faculty Comparative Medicine engages other departments in its searches to better support ongoing or developing programs. Research by UTL faculty in Comparative Medicine focuses on neuroscience including cortical function, plasticity of the sensory -motor system and epilepsy. Clinical research ranges from studies of cancer and developing new imaging modalities, to identifying diseases of lab animals and new methods to improve the quality of their care.

The teaching program of Comparative Medicine includes graduate courses in Comparative Neuroanatomy and the Neuroscience “boot camp” as well as a range of undergraduate courses related to comparative medicine and an active pre-vet club for undergraduates interested in a career in veterinary medicine. In addition to the formal course work for credit, the VSC clinical faculty train >600 individuals annually in the Care and Use of Animals in Research as well as many more in specialized techniques of animal research. The clinical faculty are actively engaged in developing an online format for some of this training.

In addition to its responsibilities for clinical care the veterinary clinical faculty and staff also work closely to support the Administrative Panel on Laboratory Animal Care (APLAC) by reviewing animal protocols and by assisting faculty in developing their APLAC protocols. The VSC provides many diagnostic and technical services to faculty who use animals in research. The animal research program has grown considerably in the last 15 years, and the Department has made clinical innovations in several areas to support the research.

I would also add that we are currently conducting a search for Dr. Cork’s successor as chair. I want to express my appreciation to Dr. Cork for the work she has done to make Comparative Medicine so successful during her tenure at Stanford. The Search Committee has identified several promising candidates and we hope that we will be able to appoint a new chair in the relatively near future. Details to follow of course.

PhRMA Adopts Some of Stanford's Gift Policies

In October 2006 the School of Medicine and Medical Center took a leading role in establishing policies on Industry Interactions for education and patient care. Since then the Stanford Industry Interactions Policy (see: <http://med.stanford.edu/coi/siip/>) has been embraced and adopted by medical schools and teaching hospitals across the USA. It was also embraced within the Conflict of Interest Policies recently put forth by the Association of American Medical Colleges (AAMC). These call for strict limits on support for medical education (see: <http://www.aamc.org/newsroom/pressrel/2008/080619.htm>) that are quite consistent with the policies we adopted two years ago. Last week the Pharmaceutical Research and Manufacturers of America (PhRMA) released its proposed "Code on Interactions with Healthcare Professionals," which limits drug marketing and gifts to health care providers. While voluntary at this point, these new policies further advance the importance of breaking away from the intended or inadvertent consequences of marketing by the drug and device industry to students and physicians. It is an important step – but it is likely that further refinement and restrictions are forthcoming.

When we enacted the Stanford policy in 2006, many concerns were expressed within our community that we could not afford to carry out education programs in the absence of industrial support. I think it is quite clear, two years later, that we have not witnessed any serious negative impact. More importantly, our students, trainees and community can be assured that their education is uninfluenced by marketing initiatives and that it is, more appropriately, based on evidence and science.

Continuing Medical Education – More to Come

In July 2007 I commented in the Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/07_09_07.html#5) that a ban on industrial support could extend to Continuing Medical Education (CME). Since that time I appointed a Task Force led by Dr. Harry Greenberg, Senior Associate Dean for Research, and Dr. Kathy Gillam, Senior Advisor to the Dean, to review the basis for industrial support for CME and provide recommendations on whether it should be banned or continued. Fourteen faculty and hospital leaders served on the Task Force and presented their findings to me on April 25th. I asked the Task Force to develop some options, and these were presented to the Executive Committee on July 18th. These options include banning industry support from the drug and device industry for CME activities at Stanford or those using the Stanford name. An alternative is to implement improved operational and regulatory management and oversight in how CME is run so as to mitigate against potential Conflicts of Interest. Of course this would be needed in any event. The Task Force also presented the option of shifting the content and focus of CME away from the traditional lecture format "update presentations" that generally define CME currently to programs that use more contemporary pedagogical methodologies and that focus more on improvements in enhancing health outcomes and promoting quality. These options were presented in an advisory manner.

It should also be noted that while the Stanford Task Force was conducting its assessment and developing proposed options, a number of advisory groups nationally posted recommendations that would severely restrict or eliminate industrial support for CME. Among these are a report from the Josiah Macy Foundation as well as reports from the AMA Council on Ethical and Judicial Affairs and the Accrediting Council for Continuing Medical Education (ACCME) that either call for a ban on industrial support or recommend that medical schools seriously review and consider such a ban.

I am currently evaluating the data gathered by the Task Force along with the changes that are now rapidly unfolding in the field. Policies related to Stanford on this important matter will be forthcoming soon.

2008 McCormick Faculty Awards

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2008 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research. Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to Jennifer Scanlin in the Office of Diversity and Leadership at jscanlin@stanford.edu by 5pm on August 31, 2008. Further information can be obtained at: http://med.stanford.edu/diversity/faculty/08mccormickcall_apps.html.

Thanks to Dr. Jerry Shefren

On Friday July 26th Stanford Hospital & Clinics hosted a reception honoring Dr. Jerry Shefren, Clinical Professor of Obstetrics and Gynecology, who has served as Vice President for Ambulatory Services for the past 6 years. During this time we had the opportunity to work closely with Dr. Shefren, and I want to offer my praise and appreciation of his leadership and collegiality. Among his contributions were the formulation and implementation of the “Funds Flow” methodology that helped execute significant advances in the operations of the medical center. I want to thank Jerry for his key role in bringing this effort to fruition and for his willingness to continue working on it, and other initiatives, to enhance the clinical programs shared by SHC and the School of Medicine. We will certainly miss him.

Honoring Dr. Bill Dement

On Saturday July 26th the colleagues and friends of Dr. William Dement gathered to celebrate his extraordinary career, during which he became the founder and father of Sleep Medicine (see: <http://med.stanford.edu/mcr/2008/dement-0723.html>). They also celebrated his 80th Birthday as well! Unfortunately I was unable to attend the gala but I did prepare a message to Dr. Dement that I would like to share with you.

Dear Dr. Dement:

I am writing to offer my very best wishes on the occasion of your 80th birthday.

You have been a scientific pioneer, visionary leader and founder of the field of Sleep Medicine since you joined the Department of Psychiatry and Behavioral Sciences forty-five years ago. Your contributions have been extraordinary, including some 500 publications, the establishment of the first sleep disorders clinic in the world, persuasive advocacy in the establishment of the National Center on Sleep Disorders Research at the National Institutes of Health and service as the Founding President of the American Academy of Sleep Medicine.

The School of Medicine and our community, locally and globally, have been most fortunate to be the beneficiary of your many fundamental discoveries as well as the place where they have been translated from basic science to the care of patients. Your work has contributed to the education of hundreds of trainees and improved the lives of countless patients over the years. I am deeply appreciative of all you have done and wish you the very best in your future endeavors.

*Sincerely,
Philip A. Pizzo, M.D.*

Honors and Awards

- **George Yang, MD, PhD, FACS**, Assistant Professor of Surgery at the Palo Alto Veterans Affairs Health Care System, has been selected to receive the first Wound Care Management Award for his research project entitled “Use of intelligent materials in wound healing applications. Congratulations, Dr. Yang.
- **Tony Tsai, MD**, has been selected as the new Baxter Fellow in the Biosciences. His research focuses on the network properties of the biochemical systems that regulate cell cycle oscillations, locomotion, and chemotaxis. Congratulations, Dr. Tsai.
- Biosciences Student Teaching Awards: The following students have been recognized for their contributions to teaching:
 - Jessica Allen, Immunology
 - Melanie Bocanegra, Cancer Biology
 - Charles Chan, Developmental Biology
 - Sarah Edwards, Chemistry
 - Ivette Estay, Cancer Biology
 - Yael Garten, Biomedical Informatics
 - Jonathan Karr, Biophysics
 - Mark McElwain, Developmental Biology
 - Leslie Meltzer, Neurosciences
 - Amy Radermacher, Immunology
 - Kenneth Schulz, Immunology

Congratulations to all!

Appointments and Promotions

- **Jeffrey Glenn** has been promoted to Associate Professor of Medicine (Gastroenterology and Hepatology, effective 7/01/08.

- **Donald Regula, Jr.** has been appointed to Professor (Teaching) of Pathology, effective 7/01/08.
- **Xiaoyuan Chen** has been promoted to Associate Professor (Research) of Radiology, effective 9/01/08.
- **Paul S. Auerbach** has been appointed to Professor of Surgery (Emergency Medicine) at the Stanford University Medical Center, effective 7/01/08.
- **Roham T. Zamanian** has been appointed to Assistant Professor of Medicine (Pulmonary & Critical Care) at the Stanford University Medical Center, effective 7/01/08.
- **Donna M. Bouley** has been promoted to Professor of Comparative Medicine at the Stanford University Medical Center effective 7/01/08.
- **Sherril L. Green** has been promoted to Professor of Comparative Medicine at the Stanford University Medical Center, effective 7/01/08.
- **John P. Higgins** has been promoted to Associate Professor of Pathology at the Stanford University Medical Center, effective 7/01/08.
- **Shashank Joshi** has been reappointed to Assistant Professor of Psychiatry & Behavioral Sciences at the Stanford University Medical Center, effective 7/01/08.

Dean's Newsletter

August 25, 2008

A New Policy on the Use of Industry Support for Continuing Medical Education (CME)

As you know from prior communications, we began reviewing the interactions between Stanford University School of Medicine and industry regarding education in 2005 and, based on the recommendations of a task force chaired by Dr. Harry Greenberg with staff support from Dr. Kathy Gillam, we initiated our Stanford Industry Interactions Policy (SIIP), that became effective in October 2006 (see:

http://deansnewsletter.stanford.edu/archive/06_26_06.html,

http://deansnewsletter.stanford.edu/archive/09_11_06.html#2). This policy

(<http://med.stanford.edu/coi/siip/>) eliminated the acceptance of gifts and other emoluments that might bias educational activities throughout the Stanford Medical Center (i.e., the School of Medicine, Stanford Hospital and Clinics and the Lucile Packard Children's Hospital). During the past two years, often based on the Stanford policy, similar policies have been enacted at medical schools and teaching hospitals across the USA. Moreover, in 2008, the Association of American Medical Colleges

(AAMC) advised all medical schools to enact policies eliminating gifts from industry for educational activities.

Since the enactment of the 2006 Stanford Industry Interactions Policy, the School has also begun to assess the degree to which industry interactions might influence the clinical care practices of our faculty. As a result, in 2007 a set of questions was added to the annual conflict of interest and commitment disclosure that asks faculty to indicate personal or family ties to industry that might impact their clinical practice behavior or recommendations. These have now become part of the School Annual Disclosure; follow-up takes place through the Conflict of Interest Review Program where appropriate and, when indicated, by the two senior associate deans for clinical affairs.

When we initiated the 2006 Industry Interactions Policy I elected to not include CME because we felt it required additional study and evaluation. Accordingly, in 2007, I initiated a review specifically focused on industry support for Continuing Medical Education (CME). A Task Force led by Dr. Harry Greenberg and staffed by Dr. Kathy Gillam was appointed. Members of the Task Force represented the School of Medicine and both Hospitals and included Drs. Jonathan Berek (Obstetrics-Gynecology), Clarence Braddock (Medicine), Mildred Cho (Medical Ethics), Harvey Cohen (Pediatrics), Iris Gibbs (Radiation Oncology), Rob Jackler (Otolaryngology), Al Lane (Dermatology), Terri Longacre (Pathology), Ms. Pam Molano (LPCH), Drs. Norm Rizk (Medicine and Clinical Affairs), Geoff Rubin (Radiology), Jerry Shefrin (SHC), David Spiegel (Psychiatry), and Ms. Rebecca Trumbull (Institutional Planning). I provided some updates before and following the Committees work (see: http://deansnewsletter.stanford.edu/archive/07_09_07.html#5, http://deansnewsletter.stanford.edu/archive/07_28_08.html#8).

The Task Force examined current policies, gathered operational and financial data for the School and Hospitals, held in-depth interviews with six clinical department chairs, had discussions with pharmaceutical and device industry leaders, and examined the literature on industry support of CME. They also reviewed policies and recommendations from national advisory and regulatory bodies, a number of which came forth with recommendations after the work of the Task Force was initiated (including but not limited to the Council on Ethical and Judicial Affairs of the American Medical Association; the AAMC; the Accreditation Council for Continuing Medical Education; and the Josiah Macy Jr. Foundation). The Task Force presented its findings and recommendations to me in May 2008 and to the Executive Committee on July 18, 2008. I requested that the recommendations be in the form of options. The Task Force complied and presented options ranging from the total elimination of all industry support for CME to options that continued support in various iterations. Throughout this time and following the presentation, comments and opinions have been welcomed from the Stanford community including the leadership of Stanford University. I carefully considered all comments in formulating the new policy that follows below.

Based on the work of the Task Force on Industry Support of CME and related advisory groups, the following summarizes **Stanford Medical School's Policy on Continuing Medical Education**:

- First and foremost, Stanford recognizes and supports the value of Continuing Medical Education for its faculty and the communities it serves.
- The historical and traditional models of CME, based largely on lectures and discussion groups, have served a purpose, although their impact on truly enhancing medical knowledge that leads to improvements in health care outcomes is unresolved. Future CME programs should take advantage of emerging technologies and should be more focused on the professional and technical development and education of the learner. New opportunities for novel programs now exist in the Goodman Center housed at SHC as well as CAPE at LPPH and the Center for Immersive Learning and, in 2010, will be abundantly available in the Li Ka Shing Center for Learning and Knowledge. Accordingly, Stanford should take a leadership role in designing and shaping the future of CME with a greater emphasis on educational efforts that target outcomes and quality improvement.
- During the past year the School has re-invigorated its Office of Continuing Medical Education, now led by Dr. Rob Jackler as the Associate Dean for CME. Effective immediately, all CME programs and activities must be administered by the Office of CME and must adhere to the policies of the ACCME and to those of the School of Medicine. No other programs will be sanctioned by the School of Medicine and Stanford University. Permission to use the Stanford name for continuing medical education or related programs, whether ACCME accredited or not, must be approved and administered by the Stanford Office of CME on behalf of the Dean. The use of outside vendors by faculty through departments or other entities may not include the use of the Stanford name unless specifically approved by the Office of CME on behalf of the Dean.
- The guiding principle is that all CME programs must be free of commercial influence, be based on the best scientific evidence available, and be focused on improving the knowledge of learners. Effective September 1, 2008, new commercial funding for specific CME courses or programs is prohibited. Commercial support includes monetary contributions as well as "in kind" support such as a loan or donation of equipment or supplies as well as services from a commercial entity. This policy applies to both on and offsite venues and functions that propose to use the Stanford name or that are directed or initiated by Stanford School of Medicine faculty. This also includes payments for third party sources or for-profit course organizers that have received industry support. Exhibitions by commercial organizations are not permitted at CME activities whether onsite or offsite locations.

- At the same time, the School recognizes that industry may wish to provide CME program support that is not designated to a specific subject, course or program but that is intended for use in a broadly defined field or discipline or field of study. Accordingly, if such support from industry for CME is received it must be directed to the Office of Continuing Medical Education. The Office of Continuing Medical Education will be responsible for coordinating and distributing funds for CME programs in the following general categories: medical, pediatric and surgical specialties; diagnostic and imaging technologies and disciplines; health policy and disease prevention; or other areas approved by the Office of CME. Such industry support cannot be designated for a specific course or program, but every effort will be made to direct support, as appropriate, to the specified general areas of interest, as noted above. Further, commercial support received by faculty or academic units for other purposes cannot be used to support CME. The faculty, in conjunction with the office of CME, will decide the choice of topic and content for all Stanford CME activities, and curricula will be chosen based on the educational needs of our learner populations.

This policy is effective September 1, 2008 and applies to all CME activities, whether ACCME accredited or non-ACCME accredited. However, in recognition of the fact that CME course directors, faculty and departments have existing contracts or agreements currently in hand, signed contracts will be reviewed by the Office of Continuing Medical Education and will be honored as long as they are fully compliant with the policies of the ACCME and the School of Medicine. Understanding that some courses or contracts are made well in advance of the date they are held, this umbrella will extend through June 1, 2009. Exceptional cases or arrangements will be examined on a case- by-case basis.

The goal and purpose of this policy are to provide the most effective and unbiased CME programs for our faculty and community.

2008 Incoming Class of Medical Students Begin Orientation Today

Eighty-six newly arrived medical students of the Incoming Class of 2008 began their orientation today. Included in this Class are 46 women and 40 men, whose collective average age is 23.7 years. Ten students will be in the Medical Science Training Program (MSTP) and, based on recent experience, other students will elect joint degree programs after beginning their studies at Stanford.

Ten of the new students did their undergraduate studies at Stanford, 7 at Yale, 6 at UCLA, 5 at Harvard, 4 at Cornell, MIT or Washington University, 3 at Duke, Princeton or UC-Berkeley, 2 at Brown, Cal Tech, Johns Hopkins, Lewis and Clark, UC-Davis or University of Toronto and 1 each at 25 other colleges or universities. The most common undergraduate majors were in the biological sciences, engineering or the social sciences. A number of incoming students had dual undergraduate majors: 16 have Masters degrees and two are completing their PhD degrees. Without question each of these students is highly accomplished, and we are thrilled to have them join the Stanford community.

They will be involved in orientation events through Thursday and will also begin classes on the same day.

Please join me in welcoming the 2008 Incoming Class of Stanford Medical students.

Heidi Heilemann Is Appointed Director of Lane Library

I am pleased to report that the search committee for the Director of the Lane Library recommended that Heidi Heileman be appointed the Associate Dean for Knowledge Management and Director of Lane Medical Library & Knowledge Management Center. I supported that recommendation enthusiastically and am happy to announce that Ms. Heilemann's appointment was effective August 1, 2008.

Heidi Heilemann has been a member of the Lane Library staff since 1993 and has served as Acting Director of Lane Medical Library since December 16, 2006. She has taught numerous courses in information literacy and played a key role in strategic planning for Lane/Knowledge Management Center and the new Li Ka Shing Center for Learning and Knowledge that is now under construction. She served as Lane's Director for Research & Instruction and led the Lane facilities update, and also designed a very successful document delivery model, redesigned the physical and virtual service desk, and developed and expanded Lane's instructional, liaison, and informationist programs. Under her leadership as Acting Director, the LaneConnex digital library system has continued to flourish and is now one of the most heavily used websites at Stanford University Medical Center, connecting researchers, students, and clinicians with digital content anytime, anywhere.

Ms. Heilemann is a distinguished member of the Medical Library Association's Academy of Health Information Professionals. She earned her undergraduate degree from the University of California, San Diego in 1989 and Master of Librarianship from the University of Washington in 1993. She also holds a Master of Liberal Arts from Stanford University and was recently awarded the 2008 Medical Library Association Murray Gottlieb Prize for a paper based on her master's thesis entitled "Envisioning the Unborn: Art, Anatomy, and the Printing Press in the Early Modern Era." She is currently completing the NLM/AAHSL Leadership Fellow program. Ms. Heilemann also serves as Lane's liaison for Bone Marrow Transplantation, the Center for Research on Women's Health and Reproductive Medicine, Hematology, Obstetrics and Gynecology, Oncology, Radiation Oncology, and the Stanford Institute for Cancer/Stem Cell Biology and Medicine.

Please join me in congratulating Ms. Heilemann on her new appointment and in wishing her – and the Lane Library – the best of continuing success.

Update on the Transitions Task Force

A little more than a year ago I reported on the establishment of a Task Force on Senior Faculty Transitions (http://deansnewsletter.stanford.edu/archive/07_09_07.html) whose

purpose was to identify and address issues associated with various types of transitions experienced by our senior faculty. These can include faculty who transition from active to emeritus status, as well as those who step down from a period of administrative service to a more focused faculty role, as well as faculty who move from a phase of intense research activity to one of lesser intensity, especially because of loss of funding or faculty who transition from more full-time clinical work to either reduced clinical loads or other activities. I was especially interested in having the Task Force explore ways in which these transitions can occur smoothly, ideally with anticipatory planning and with dignity.

At the August 15th Executive Committee meeting, Dr. Gary Schoolnik, Professor of Medicine (Infectious Diseases and Geographic Medicine) and Chair of the Task Force, presented the first of two discussions on the group's results and recommendations. He focused on retirement and loss of funding issues; administrative transition issues and implementation plans and timelines will be presented at an upcoming meeting. Although the Executive Committee won't address implementation efforts until its September 19th meeting, I wanted to share this update with you so that you are informed about what is transpiring and also have an opportunity to comment should you choose to do so.

Dr. Schoolnik reported that the Task Force began its work by reviewing demographic data on our faculty. These show that the fraction of our faculty aged 51 and older has risen from 36% in FY95 to 47% in FY07. The mean age of retirement from September 1994 through March 2007 has been 65.6 years (with a standard deviation of 5.86 years). (However, as will be seen below, there is reason to think that this age will increase in coming years.) The Task Force also looked broadly at current policies and programs related to faculty transitions. While the mechanisms for making the transition to retirement are well established, there is limited flexibility in such areas as part-time appointments as a means of phasing into retirement and no flexibility in the use of the Faculty Retirement Incentive Program (FRIP). In addition, there seemed to be a dearth of available information from either the Stanford or national experience on such aspects of making transitions as phasing down one's laboratory, and information concerning retiree benefits was perceived by the Task Force as needing greater clarity.

The centerpiece of Dr. Schoolnik's presentation was his report on the survey on senior faculty transitions that the Task Force conducted in the fall of 2007. This survey, which was sent to all faculty age 50 and older (the regular active faculty) and all emeriti (active and inactive), had a high response rate of 61%, which, in the eyes of the Task Force, indicated a high degree of interest in this topic. Among the key findings were:

- 33% of the regular active faculty respondents have not yet done any financial planning for retirement. This group included 42% of the respondents aged 55-59, 29% of those aged 60-64, and 27% of those aged 65-69. I find this to be one of the most startling findings of the survey. This high rate of absent planning underscores the importance of developing programs and resources to better assist our faculty with transition planning.
- Among the regular active faculty, those who knew the least about the retiree medical benefits were the most concerned about them and, conversely, those who knew the most were the least concerned.

- Among the regular active faculty, only 27% of those aged 60-64 believes they have sufficient funds to retire now; 29% believe they will have sufficient funds in 5 years. Among those aged 65-69, 55% believe they have sufficient funds now, and 30% believe they will have them in 5 years.
- 43% of the regular active faculty anticipates retiring at age 70 or older. I anticipate that this percentage will increase in future years
- 73% of the regular active faculty appears interested in a phased retirement program.
- There is a lack of clarity concerning the consequences to one's salary, research expenses, research space, laboratory staff and postdocs, and teaching and clinical responsibilities in the event of a short-term or long-term downturn in extramural funding.

Dr. Schoolnik concluded his presentation with an examination of how personal circumstances (financial savings for retirement) can interact with professional and institutional ones (downturn in extramural funding and the School's response; FRIP eligibility) to determine individual decisions to retire. He also introduced the set of recommendations developed by the Task Force that are under review by the Dean's Office. These will be discussed at the September 19th Executive Committee meeting. A more complete report on the Task Force survey will be forthcoming as well.

In addition to Dr. Schoolnik, the Task Force consisted of Dr. Kathy Gillam, Senior Advisor to the Dean and Co-Chair; Drs. John Boothroyd, Regina Casper, Linda Cork, Harry Greenberg; Rob Krochak; Drs. Peter Gregory, Bob Lehman, Michael Levitt, Jim Mark; David O'Brien; Drs. Christy Sandborg and Stanley Schrier; Ellen Waxman, and Sam Zelch. Christopher Gerlach also played a pivotal role in the work of the Task Force. I am extremely appreciative of all of their efforts.

Again, if you have thoughts or comments about this issue, please contact me, Dr. Schoolnik or Dr. Kathy Gillam. We are interested in your reactions and recommendations.

Update on the Department of Chemical and Systems Biology

At the August 15th Executive Committee, Dr. Jim Ferrell, Professor and Chair of the Department of Chemical and Systems Biology gave an update on the department. A brief summary of his comments follows:

In 2006 the Dept. of Molecular Pharmacology became the Dept. of Chemical and Systems Biology, with the new name reflecting the department's focus on complex biological phenomena and the application of novel chemical technologies to the analysis of such phenomena. The mission of the department is to foster creative interdisciplinary research in chemical biology and systems biology, to build outstanding curricula in these subjects, and to tie together the university's greater chemical biology and systems biology communities. The department is housed in the CCSR Building (third floor, north) and the Clark Center (second and third floors, west).

Over the past five years, the department has recruited three outstanding young scientists. James Chen, a synthetic organic chemist and zebrafish developmental biologist who has developed clever new strategies for turning gene expression on or off at specific times and in specific cells in the developing embryo; Tom Wandless, a synthetic organic chemist who has invented new, generalizable methods for conditionally regulating protein function; and Joanna Wysocka, a biochemist investigating the epigenetic regulation of gene expression through chromatin remodeling.

The new faculty members are complemented by five senior faculty members, comprising Karlene Cimprich (DNA damage signaling), Jim Ferrell (systems biology, cell cycle regulation), Tobias Meyer (signaling networks, calcium regulation), Daria Mochly-Rosen (isoform-specific therapeutic modulation of protein kinase C function), and Richard Roth (insulin signaling). In addition, the department includes six courtesy faculty members. Matt Bogyo, Pathology/Micro & Immunology; Markus Covert, Bioengineering; Stuart Kim, Developmental Biology/Genetics; Calvin Kuo, Medicine (Hematology); Beverly Mitchell, Medicine (Oncology); and Paul Wender, Chemistry.

Notable achievements over the past several years include establishment of the High Throughput Bioscience Center, directed by James Chen and David Solow-Cordero, and the successful acquisition of two new interdisciplinary training grants from the NIH. Our graduate students, postdocs, and faculty have received numerous prestigious fellowships and awards. Both federal and non-federal research support is growing; current projections estimate a 28% increase over the period of 2006 to 2009. These accomplishments augur well for an exciting future for the Dept. of Chemical and Systems Biology.

New Version of CAP Adds Stanford Postdoctoral Fellow Profiles

Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology IRT, has informed me that the Office of IRT (<http://irt.stanford.edu/>) is releasing version 1.5 of the Community Academic Profiles (CAP) system (see: <http://med.stanford.edu/profiles/>). Based on the success of the CAP program, IRT has worked closely with the Office of Postdoctoral Affairs (<http://postdocs.stanford.edu/>). As a result, 1032 new postdoctoral fellow have been added to the over 1200 faculty profiles already in the system.

In addition to the usual CAP data, these new profiles display links to the postdoc's faculty advisor profile. In turn, the faculty profiles now display a list of postdoctoral advisees with links to the appropriate profiles. Accordingly, all CAP profiles can now be viewed by name, type (faculty or postdoc) and department. CAP profiles can also be searched by name and content. In addition, departmental web editors can now add both faculty and postdoc CAP profiles to their web sites. Over the weekend CAP has been loading postdoc MEDLINE citations from PubMed, and these will be available for their review starting today, August 25th. We expect to see the data in these new profiles grow over the next few weeks as postdocs add and edit their CAP information.

According to Dr. Lowe, the addition of the postdoc population into CAP is just one of a number of enhancements that the IRT CAP team, led by Michael Halaas, is planning for the system. In late September, as part of the Stanford Medicine public web integration project between the School of Medicine and Stanford Hospital and Clinics (SHC), physician data will be added to CAP, providing an integrated profile for clinical faculty that can be accessed by the Stanford community, the public, patients and referring physicians. In the first half of 2009, version 2 of CAP will support tools for discovery of linkages between CAP profiles and provide a more powerful CAP search interface.

CAP is one of the most frequented Web sites at the School of Medicine, particularly by visitors from outside of the University. If you haven't updated your CAP profile lately, please take a moment to login at:
<http://med.stanford.edu/profiles/>

Meetings Commence to Learn How to Enhance the Career Development of Women Junior Faculty

Based on discussions with Hannah Valantine, Senior Associate Dean for Diversity and Leadership, we have begun small group meetings that will engage 5-6 women junior faculty at a time to discuss issues they believe promote or impede their career development. During the next two months we will try to meet with every women junior faculty member. We began these meetings two weeks ago and have had five sessions to date. The meetings are not structured but are intended to explore the issues and concerns that these faculty believe are important to their future development. I am particularly interested in learning whether our mentorship and support systems at Stanford are helpful. And of course we are interested in learning what other steps we can take to make our faculty more successful. While I realize that issues of career development for junior faculty impact both men and women, I also believe that the stresses are higher and the issues more pressing for women, and, thus, I elected to focus on them at this time. We hope to compile the issues we learn about during the next months into a report and list of action items that I will be pleased to share with you at a later time.

Sustainability at the School of Medicine

Sustainability has been most simply defined as “meeting the needs of the present without compromising the ability of future generations to meet their own needs.” It is an economic, social, and ecological concept intended to be a means of configuring civilization and human activity so that society and its members are able to meet their needs and express their greatest potential in the present, while preserving biodiversity and natural ecosystems, and planning and acting for the ability to maintain these ideals indefinitely. Sustainability affects every level of organization, from local to global. Given this – and our ever-increasing concerns about our environment, an important initiative on sustainability is being launched at the School of Medicine.

A Sustainability Steering Committee has been convened to define and implement our efforts in this critical area and to create the momentum needed to engage every member

of the School to do what they can towards making us -- and our community --more sustainable. The Sustainability Steering Committee is chaired by Julia Tussing, Managing Director for Finance and Administration; its members are: Elizabeth Walter, Elizabeth Goldsmith, Maggie Saunders, Gary Malinverno, Lorna Groundwater, Mary Bobel, Dave O'Brien, Bob Burkhardt, and Gabe Garcia. The focus of the Steering Committee will be to promote a culture of individual responsibility for sustainability within the school by engaging the entire SOM community and working collaboratively with the Hospitals.

This effort complements other Stanford campus undertakings, including the Sustainability Working Group under the new Sustainability and Energy Management Executive Office and the Sustainable IT group.

The School has already been very active in sustainability projects, particularly within the Offices of Facilities Planning and Management and Information Resources and Technology. Some recent accomplishments include:

- Achieving nearly 100% participation in Big Fix (automatic monitor turnoff)
- Significant reductions in water use over the past few years (more than 26 million gallons saved annually)
- Sustainability elements in the design, construction and retrofit of our buildings (in Li Ka Shing Center a highly efficient elevator, and chilled beam system with external shading to reduce HVAC demands; the Fairchild demolition was 97% recycled; Beckman is being retrofitted; SIM I will include recycled carpets and “green” furniture, among many other plans)
- Significant (and on-going) lighting efficiency improvements

Additional projects include the sample storage effort, which will reduce the number and improve the efficiency of the many -80 freezers at the School; and the trip reduction efforts that were begun to comply with GUP requirements.

It is up to every individual to make a personal commitment to sustainability. Many day-to-day decisions that you make as an employee or as a member of the SOM community or in your personal life can have an impact. We each need to become more aware and engaged. Every small change adds up to big differences. A few that I will suggest right now are:

- Buy only 100% recycled white paper (30% recycled content for colored) for use in your department, and default your printer to print two sided
- Reduce or eliminate your use of bottled water—bring a container from home and fill it from the tap
- Purchase compostable dishes and utensils if you must have disposable items in your office kitchen, and have everyone bring their own mug instead of using disposable cups
- Commit to depend on local food sources wherever possible that reflects regional seasonal availability and that does not require transportation from distant sites – and even countries.

Anyone interested in learning more about this effort should contact Julia Tussing at tussing1@stanford.edu. A website is under construction and will soon be published. More importantly, we are interested in your suggestions about how we can become more attentive to sustainability – individually or as a medical school and university.

Biochemistry Department Celebrates 50 Years of Excellence

On August 22-23rd the Department of Biochemistry hosted a celebratory reunion and research symposium for its graduates, faculty and current students and trainees. The events were attended by hundreds of faculty and leaders from across the USA and from around the world.

As you know, the history of the Biochemistry Department is closely linked to the School of Medicine, especially during its relocation to the Stanford campus in 1959. It was the vision of the then-President Sterling and Provost Terman, in conjunction with faculty leaders and the Board of Trustees that forecast the important opportunities that could unfold by having the medical school proximate to the schools of engineering and humanities and sciences. And it was the initiative of Sterling and Terman, in partnership with medical school leaders like Henry Kaplan, Bob Alway and Avrum Goldstein, that led to the recruitment of Dr. Arthur Kornberg to establish a new department of Biochemistry at Stanford. Further, it was a sign of Dr. Kornberg's strong leadership and commitment to scientific excellence that he brought with him his entire department of Microbiology at Washington University to found this new department. Those individuals included Buzz Baldwin, Paul Berg, David Hogness, Dale Kaiser and Bob Lehman. Each has had a luminary career in his own right, and together they forged both a department and a scientific family that educated and trained many of the world's leaders in biochemistry and the biosciences. Equally important, these faculty helped nucleate the School of Medicine and propel it on its path of 50 years of excellence as a leader in science and medicine.

When originally conceived, this celebratory event was planned by Drs. Suzanne Pfeffer and Mark Krasnow, both professors of Biochemistry, along with their colleagues, to honor Dr. Arthur Kornberg for his 90th birthday, which would have been on March 3rd. Unfortunately, Dr. Kornberg died last October. The event honored Dr. Kornberg's life and remarkable contributions to science –and to Stanford – as well as 50 years of excellence of Biochemistry at Stanford.

Employee of the Year Spirit Award

I have received the following announcement from the Spirit Award Selection Committee. I hope you will take the opportunity to nominate someone for this award.

Dear Colleagues:

The School of Medicine is pleased to announce that nominations are currently being accepted for the Dean's 2008 Employee of the Year SPIRIT Award. This

award acknowledges two staff members -- one exempt and one nonexempt -- who have provided outstanding contributions to the mission and vision of the School of Medicine. Dean Pizzo will present each of the two selected staff members with a \$1,500.00 cash award at the School's Annual Staff Recognition Banquet on November 6, 2008. All nominees will receive a letter congratulating them on their nomination.

Criteria and Eligibility

Any faculty, staff, student, fellow and post doc working at the School of Medicine may nominate any eligible staff members (i.e., non-exempt and exempt) -- bargaining unit workers are not eligible -- in any department or administrative area who meet the award criteria. To be selected, the nominee must consistently demonstrate the following traits:

Customer service

Positive attitude

Initiative

Dedication

Motivation

Team Player

Staff members must have been employed as regular employees, at least half-time (50% FTE) or more, in one department/unit for the past 2 years.

Nomination Process

Beginning this year, all nominations must be electronic. Nomination ballots can be accessed online at <http://med.stanford.edu/SPIRIT/> Fill out the online form, then click the SUBMIT button (only once) -- and your ballot will be forwarded to the SPIRIT Award Selection Committee, Human Resources Group. All ballots must be received by Friday, September 2, 2008. Late ballots will not be accepted. Recipients will be selected and notified in late October and will be invited to attend the Dean's Recognition Program on November 6th.

We are quite excited to bring this award forward once again and hope you will use this opportunity to nominate deserving employees. Please let me know if you have any questions (or suggestions) about the aforementioned process or award.

Thank you for your participation!

2008 McCormick Faculty Awards

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2008 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research. Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to

Jennifer Scanlin in the Office of Diversity and Leadership at jscanlin@stanford.edu. The deadline for proposals is **August 31, 2008 (5 pm)**.

Further information and details on how to submit your application can be obtained at: http://med.stanford.edu/diversity/faculty/08mccormickcall_apps.html. Questions can be directed to Jennifer Scanlin, Office of Diversity and Leadership <http://med.stanford.edu/diversity> at 650-725-0052, or at jscanlin@stanford.edu

Awards and Honors

- **Dr. Joe Presti, Jr.**, Professor of Urology, was named the first incumbent of the Thomas Stamey Research Professorship in Urology at an induction ceremony held on July 29th. This professorship was made possible by gifts from Ofelia and Joe Gallo, Mary Gallo, The Ernest Gallo Foundation, Jill and Boyd Smith, Mary Lois and Jack Wheatly, Waffeya and Charles Lacey, George Ling, Lisa and Robert Maloff, Virgil Place, Joanne Casey and Warren Wilson, Betsy Woolpert, and in memory of Peter Newton. Each of these individuals also honored Dr. Tom Stamey by helping to create this professorship in his name. Please join me in congratulating Drs. Stamey and Dr. Presti.
- **Dr. Marilyn Winkleby**, Professor of Medicine and Director of the Office of Community Health, was selected by the Palo Alto Chamber of Commerce to receive the 2008 Athena Award, a national tribute given to women who have demonstrated excellence, creative and initiative” and who have devoted time to improving the lives of others and to helping other women leaders. This recognition is most well deserved. Please join me in congratulating Dr. Winkleby.
- **Cheryl Gore-Felton**, PhD, Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, received the Emerging Leadership Award from the Committee on Women in Psychology, American Psychological Association at the 116th Annual Convention in Boston, MA for her research that focuses on quality of life, coping, trauma, and HIV prevention among women. Please join me in congratulating Dr. Gore-Felton.
- **Dr. Michael D. Grecius**, Assistant Professor in the Department of Neurology and Neurological Sciences, has been awarded a Brain and Immuno-imaging Grant from the Dana Foundation. It is a 3-year, \$200,000 grant that will examine the utility of functional brain connectivity, measured with fMRI, in predicting the response to anti-depressant medication. Please join me in congratulating Dr. Grecius.

Appointments and Promotions

- **Steven Artandi** has been promoted to Associate Professor of Medicine (Hematology), effective 8/01/08.
- **Sara Michie** has been promoted to Professor of Pathology, effective 8/01/08.

Dean's Newsletter September 8, 2008

Transitions in Neuroscience Leadership at Stanford

Following the delineation in early 2002 of the School of Medicine's Strategic Plan, *Translating Discoveries*, we launched the Stanford Institutes of Medicine. The Stanford Institute for Stem Cell Biology and Regenerative Medicine, established in December 2002, was the first, followed in 2003 by the Neurosciences Institute at Stanford (NIS). These were followed in turn by the Stanford Cardiovascular Institute; the Institute for Immunity, Transplantation and Infection; and the Stanford Cancer Center, which became an NCI-designated Center in 2006.

I want to update you now on some programmatic and personnel transitions in our neuroscience leadership and initiatives. First, I want to thank Dr. Bill Mobley, the John E. Cahill Family Professor of Neurology and, by courtesy, of Neurosurgery, for his leadership as the first director of the NIS over the past five years. Dr. Mobley played an important role in bringing the neuroscience community together both within the medical school and across the university. Dr. Mobley's leadership resulted in a number of seed grants for innovative research and education, the development of new programs and centers, the recruitment of outstanding faculty (including most recently Dr. Tom Sudoff as the first Avrum Goldstein Professor), the opening of the new neuroscience research facility at the Arastradero Stanford Institutes of Medicine site, and, of course, the annual neuroscience retreats. I want to thank Dr. Mobley for his dedicated and important efforts as the founding NIS director.

I am also pleased to announce that Gary Steinberg, MD, PhD, the Bernard and Ronni Lacroute-William Randolph Hearst Professor in Neurosurgery and Neurosciences and Professor, by courtesy, of Neurology & Neurological Sciences, will assume the leadership of the Stanford Institute for Neuroinnovation and Translational Neurosciences (SINTN), which is an evolution of the NIS. Given Dr. Steinberg's remarkable accomplishments in building the Department of Neurosurgery over the past decade as well as his success as a leading investigator and outstanding (and highly active) clinical neurosurgeon, we are most fortunate to have him in this role. Dr. Steinberg will spearhead a number of new initiatives – especially a new program in neuroregeneration as well as a collaborative effort that could form a Center for Neuroprostheses at Stanford. Please join me in welcoming Dr. Steinberg to this important new role.

I am also pleased to announce that Ben Barres, MD, PhD, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences, became the chair of the Department of Neurobiology on September 1st. Dr. Barres is not only an outstanding neuroscientist but also a leader in education (he founded the Masters in Medicine Program at Stanford) and a highly regarded teacher. In addition, he is an important advocate for women in science and medicine and an articulate spokesperson for science policy. I am pleased that Dr. Barres will be joining our leadership team and look forward to his broad participation in neuroscience as well as his engagement in addressing the challenges facing the school of medicine and the university. Dr. Barres succeeds Dr. Bill Newsome, Professor of Neurobiology and Member of the Howard Hughes Medical Institute, who has stepped down as department chair to lead a new BioX initiative called Neuroventures.

We are fortunate to have remarkable leaders in neuroscience at Stanford— and even more fortunate to have faculty and students across the university who are committed to this discipline. Without question neuroscience is one of the most important and exciting areas of investigation today, and Stanford is widely viewed as one of the national centers of excellence. With these new leaders and programs in place, I hope that our neuroscience community will achieve even greater things in the years ahead and that these new programs make the “sum much greater than the sum of all the parts” already resident at Stanford.

Stanford Medicine as a Case Study

As part of a series on the changing face of academic medicine, I was asked to write an article for **Academic Medicine** on *The Stanford University School of Medicine and Its Teaching Hospitals*. This was published in the September 2008 issue (Volume 83; pages 867-872). While this article is a personal reflection of the changes that have occurred at Stanford during my tenure as dean, it contains observations that may be of interest to you. In this article I review the history of Stanford Medicine, focusing particularly on the changes that have taken place in the past 50 years and also on the impact of major transformative events, including the merger and demerger with UCSF. I also address the challenges we face today and how we have approached them based on *Translating Discoveries*, the strategic plan I put into place shortly after my arrival in 2001. I further address the challenges we currently face and those that will assume prominence in the years ahead. The abstract of the article follows and provides a brief glimpse of some of the issues that are addressed.

There is wide variation in the governance and organization of Academic Health Centers (AHCs), often prompted by or associated with changes in leadership. Changes at AHCs are influenced by institutional priorities, economic factors, competing needs, and the personality and performance of leaders. No organizational model has uniform applicability, and it is important for each AHC to learn what works or does not on the basis of its experiences. This case study of the Stanford University School of Medicine and its teaching hospitals—which constitute Stanford’s AHC, the Stanford University Medical Center—reflects

responses to the consequences of a failed merger of the teaching hospitals and related clinical enterprises with those of the University of California-San Francisco School of Medicine that required a new definition of institutional priorities and directions. These were shaped by a strategic plan that helped define goals and objectives in education, research, patient care, and the necessary financial and administrative underpinnings needed. A governance model was created that made the medical school and its two major affiliated teaching hospitals partners; this arrangement requires collaboration and coordination that is highly dependent on the shared objectives of the institutional leaders involved. The case study provides the background factors and issues that led to these changes, how they were envisioned and implemented, the current status and challenges, and some lessons learned. Although the current model is working, future changes may be needed to respond to internal and external forces and changes in leadership.

I also include here the final section of the article, “Lessons Learned” – again, this is a set of personal reflections based on the experiences we have had at Stanford during recent years that others may find useful. These are less about lessons and more about key observations and requirements for assuring success – again, largely based on my personal assessment.

- *Because AHCs are often highly matrixed by interdependent interactions relationships between academic and clinical programs, they are also fragile and can be adversely affected when one mission gets off track or dominates the enterprise in an unhealthy way. This was true at Stanford when the merger with UCSF created distractions, financial losses, and distrust between the faculty in basic and clinical departments and between the AHC and university. To overcome these challenges, a transparent and thoughtfully articulated plan was essential.*
- *Overcoming a major disruption such as a failed merger requires a redefinition of the mission, goals, and objectives of both the medical school and the AHC. It requires buy-in from multiple constituencies including the basic and clinical science faculty, students, and staff. It also requires healing among communities that had felt disenfranchised or even abandoned by an institutional direction they did not understand or support.*
- *Communication is a key component of institutional transformation, along with clearly delineated plans that are modified and adjusted to accommodate to the various institutional constituencies and their not infrequently differing perspectives. This requires communication from the leadership that is transparent, engaging, informative and continuous.*
- *Institutional progress requires plans and objectives that are not only transparent but also achieved. Institutional ownership of the planning process and its deliverables is essential and should not be delegated to outside consultants or individuals who are not responsible and accountable.*

- *Transformational planning is a constant process with frequent ebbs and tides. Because of the diversity of talents, interests, and commitments at an AHC, it cannot be expected or anticipated that unanimity of opinion or support will be achieved. Difficult choices need to be made, priorities set, and accountability recognized. That said, progress is more possible when the institutional planning is adjusted to fit the culture, history, and values of the institution.*
- *Most AHCs have to make choices about their areas of focus and institutional priorities, because few are large enough to do everything. When there are internal or external constraints, forward planning is essential. Even if the plans are not fully achieved, they provide a foundation for future adaptation and modulation. During the past several years, the school's strategic plan, *Translating Discoveries*, has served as an anchor by which to align missions in education, research, and patient care.*
- *Understanding the inherent strengths and distinguishing features of an institution is also essential to successful planning. When Stanford's medical school began separating its functions and missions from its parent university, it lost the trust of the university faculty and became perceived as a liability rather than an asset. Efforts to better integrate the medical school with the missions of the university (through the BioX program, the department of bioengineering, and the Institutes of Medicine) have helped to overcome some of the misperceptions and have led to positive interactions that appeal broadly to university leaders and the community.*
- *Leadership models at AHCs are highly varied, and none are necessarily sustainable over time. Stanford's separate leadership of its medical school and two major teaching hospitals provides both strengths and weaknesses. Whereas the overall mission has been served because of the positive interactions of current leaders, this model is not necessarily sustainable, and it could be compromised by resource constraints that pit one mission against another or by changes in the individuals that alter the dynamics or trust of institutional leaders.*
- *Having the trust and authority of the university president, provost, and board of trustees is essential, especially when major changes are contemplated or being implemented. But, this trust is also subject to change and, thus, must be constantly reinforced by evidence of progress. Objective external evaluation of this project on a regular basis serves to validate the plans and the leadership. But it must be recognized that such external reviews can also result in changes in institutional direction or leadership as well – and, thus, this must be anticipated.*
- *AHCs are likely to be especially challenged in the next decade, ironically because of the destabilization likely to occur from some of the forces that brought them into their current structure and function. For example, with the anticipated changes in Medicare and the reduced support of biomedical research from the NIH, the historically highly leveraged success of AHCs will be increasingly*

compromised. Likely, new models will need to be developed to sustain core missions in research and education as well as patient care. These external forces make ongoing institutional planning essential; without such efforts, inadvertent damage can easily occur. As mentioned above, despite their formidable strengths, AHCs are also fragile, and without planning and leadership, they can lose their focus, and potentially, their preeminence.

If you have time to read the entire article, I would be appreciative. More importantly, if you have comments or your own reflections to offer, I would welcome them.

Children's Health Initiative Reviewed

Pediatrics and child health have undergone dramatic changes at Stanford and at the Lucile Packard Children's Hospital (LPCH) during the past decade. The major stimulus for the broad initiatives that have catapulted LPCH and Stanford pediatrics into ever-increasing prominence can be directly correlated with both the Children's Health Initiative (CHI) and the collaborations and interactions of the School of Medicine, LPCH and the Lucile Packard Foundation for Children's Health (LPFCH). Thanks to a nucleus grant from the David and Lucile Packard Foundation, along with the availability of matching funds for gifts raised by the LPFCH, more than \$500 million in endowment and expendable funds have been raised, making the CHI a unique resource for the success of LPCH and Stanford. The initial phase of CHI focused on the development of "centers of clinical excellence" at LPCH, along with the development of the infrastructure to support clinical research and the development of the medical and surgical specialties needed to enhance outstanding clinical care and help sustain the future of the clinical and academic programs in pediatrics and, more broadly, child health.

A key decision made when CHI was being initiated was to integrate pediatrics and the CHI with the broader initiatives of the medical school and university. Unlike other prominent children's hospitals that have created their own separate research initiatives and facilities, we felt that Stanford and LPCH would be better served by aligning their goals and creating a synergy between pediatric medical and surgical faculty with colleagues across the basic and clinical sciences in the School of Medicine and the broader community of the University. This strategy is clearly paying off.

The Clinical Centers of Excellence at LPCH have been aligned to the programmatic initiatives of the Stanford Institutes of Medicine, resulting in a bidirectional flow of knowledge generation and education. The resources generated by CHI has enabled the recruitment of outstanding pediatric leaders to direct LPCH Centers of Excellence who work in close partnership with Stanford Institute of Medicine Directors, as shown in the following table:

<i>The Children's Health Initiative</i>		<i>The Stanford Institutes of Medicine</i>	
Center of Excellence	Directors	Stanford Institutes of Medicine	Directors

Children's Heart Center	<i>Drs. Frank Hanley & Dan Bernstein</i>	Cardiovascular Institute	<i>Dr. Bobby Robbins</i>
Transplant and Tissue Engineering Center	<i>Drs. Ken Cox and Mike Longaker</i>	Institute for Stem Cell Biology and Regenerative Medicine Institute for Immunity/Transplantation and Infection	<i>Drs. Irv Weismann, Mike Clarke and Mike Longaker</i> <i>Drs. Mark Davis and Carlos Esquivel</i>
Cancer and Blood Disease Center	<i>Drs. Mike Link, Mike Cleary and Ken Weinberg</i>	Stanford Cancer Center	<i>Dr. Bev Mitchell</i>
Brain & Behavior Center	<i>Drs. Robert Fisher and Mike Edwards</i>	Institute for Neuro-innovation & Translational Neuroscience	<i>Dr. Gary Steinberg</i>
Center in Pulmonary Biology	<i>Dr. David Cornfield</i>	Wall Center	<i>Drs. Jeff Feinstein, Marlene Rabinovitch</i>
Clinical Research Core	<i>Drs. Christy Sandborg and Steve Alexander</i>	SPCTRM and CTSA	<i>Drs. Harry Greenberg and Steve Alexander</i>
Center for Bio-Informatics	<i>Dr. Atul Butte</i>	Center for Clinical Informatics & Center for Biomedical Informatics	<i>Drs. Henry Lowe, Russ Altman, Mark Musen</i>
Center for Policy, Outcomes and Prevention	<i>Drs. Paul Wise and Tom Robinson</i>	Center for Primary Care and Outcomes Research Stanford Prevention Research Center	<i>Dr. Alan Garber</i> <i>Dr. Steve Fortmann</i>
Johnson Center for Pregnancy & Newborn Services	<i>Drs. Druzin, Benitz and Stevenson</i>	Programs in Developmental Biology, Genetics, Epidemiology	

These alignments have helped forge important collaborations among numerous faculty and students across the school and university that have enhanced pediatric and child health research. The progress being made in these areas was reviewed by the Pediatric Medical Advisory Committee (PMAC) on September 4-5th as part of their ongoing evaluation process. The PMAC includes Dr. Tom Boat, who serves as chair of the PMAC and who is currently Executive Associate Dean for the University of Cincinnati College of Medicine and immediate past director of the Children's Hospital Research Foundation

and Chair of Pediatrics at the Children's Hospital Medical Center of Cincinnati. Dr. Boat is also a member of the School of Medicine's National Advisory Council. Other PMAC members included Dr. Doug Jones, Professor of Pediatrics at the University of Colorado, where he also served as chair of Pediatrics from 1990-2005; Dr. Ora Pescovitz, President and CEO of Riley Hospital for Children where she is also Executive Associate Dean for Research Affairs at Indiana University School of Medicine; and Dr. George Gittes, Professor of Surgery at the University of Pittsburgh. The PMAC heard updates and presentations from each of the Center and Program leaders as well as the leadership of LPCH, LPFCH and the Medical School. I gave a presentation as well as participated in some of the discussions.

While we will need to wait to get the formal report from the PMAC, I think it is safe to say that the progress that has been made through the CHI is quite impressive. Indeed, when we recently carried out the search for the chair of Pediatrics, I heard from virtually every finalist candidate that LPCH and Stanford are viewed as having one of the most dynamic and rapidly rising programs of excellence in the nation. I am sure that is what helped us to recruit an excellent chair in Dr. Hugh O'Brodovich as well as the many faculty leaders who have joined Stanford and LPCH during the past 7-8 years.

That said, it is clear that there are important challenges and opportunities to be met. While we have achieved excellence in a number (but not yet all) of the major clinical programs, there are real needs in bolstering the research faculty, recruiting junior physician-scientists and in re-developing the training programs for residents and fellows. Thankfully there is again concurrence among the leaders of LPCH and the School about these initiatives, and we are committed to increasing our academic research programs by 50% and also to recruiting and developing the future leaders in child health research and science. These efforts will be enhanced and facilitated by the development of a Child Health Research Institute that will build on the CHI and take it to another level. Work on this project is being led by Dr. O'Brodovich and will be discussed in future Newsletters.

For now I think it is clear that we can look back on the last decade of Stanford/Packard Pediatrics with pride. But we must also look forward to taking the CHI to a new level by further developing its academic performance and success. Thankfully the leaders and institutional commitments to do so are in place and eager to move forward.

Comparative and Real Success in Medical Development

At the Executive Committee on Friday, September 5th, Doug Stewart, Associate Vice President and Director of the Office of Medical Development (OMD) gave an update on our accomplishments during the past fiscal year (which ended on August 31st) and put our medical development success in a broader context by comparing our results to those of other institutions around the nation.

The good news is that the School of Medicine had another banner year in private fundraising support. Indeed, it was our second-best year ever, with new gifts and pledges totaling \$220.9 million. Our record of \$246.4 million was set last year. Doug observed that our achievements this past fiscal year are particularly noteworthy

given the economic slowdown – but I would note that the impact of the slowdown may be felt more strongly in this next and immediate future years. I would also add for context that it was only a few years ago that the School of Medicine routinely saw new gifts and pledges of approximately \$100 million per year. In truth our OMD was not operating very effectively at that time, and I believe we are also now witnessing the results of our investment in leadership in medical development and the recruitment of a development staff, the configuration of the needed infrastructure supports and, of course, the committed efforts of many of our faculty and our wonderful campaign volunteers.

Doug also reviewed the remarkable progress we have made on the School's two current major capital projects: the Li Ka Shing Center for Learning and Knowledge (LKSC) and the Stanford Institutes of Medicine 1 (SIM1). I have personally spent a great deal of time and effort on each of these projects, and I am gratified that we can see the light at the end of the tunnel on both. Doug reported that we now have gifts and pledges totaling \$49.4 million for the LKSC (compared with only \$12 million a year ago). This brings us nearly to our original fundraising goal of \$50 million, and, equally importantly, we now are confident we will reach our expanded goal of \$57 million. Given the perceived difficulties of raising gifts for an education facility, achieving this level of success is particularly gratifying – and gives evidence that we can succeed when we have bold and important ideas to present to the community – as is clearly the case for the LKSC.

The SIM1 fundraising progress has been equally impressive. One year ago we had gifts and pledges totaling \$63.5 million toward our original goal of \$100 million. However, when the cost of the building was actually defined we needed to expand that goal to \$130 million. Today we count \$113.1 million toward that expanded goal and are confident that we will achieve at least \$125 million of it by year end. By the way, this does not include the \$43.5 million facilities grant award we have received from the California Institute of Regenerative Medicine. I also hasten to add that we will be soon announcing the naming donor for SIM1, and clearly this will be a moment for celebration and appreciation.

Doug also shared with the Executive Committee an analysis of comparative data collected by the Association of American Medical Colleges (AAMC) about fundraising results and development costs at our national peer institutions. Here too the results are impressive: during the latest year available (Fiscal Year 2007), the Stanford School of Medicine was in the top five programs in the country in total private (cash) support and, in the top 10 among the 119 institutions reporting their data -- a group that includes Johns Hopkins, Memorial Sloan Kettering, M.D. Anderson, Massachusetts General Hospital – institutions that are not only much larger than Stanford but which also have had more long-standing development operations. During the past few years we have invested considerable resources in Medical Development – beginning with our recruitment of Doug Stewart as Director and followed by the rebuilding and expansion of OMD. But even with that our staff size and cost of fundraising remains among the lowest of our peers – another testament to our current success.

Of course I want to congratulate Doug Stewart and everyone in the Office of Medical Development for their efforts and professionalism. I also want to thank our department chairs, institute directors and faculty, who have played a key role in raising private support for both our programs and facilities. Without their excellent work and many contributions we could not succeed – and certainly would not have as compelling a story to tell. Most important, I want to thank the donors and community members – locally and globally – who have confidence in Stanford and whose generosity enables us to recruit and retain the best faculty and build world-class research and educational facilities for the 21st Century. These resources make possible our work preparing tomorrow's medical and scientific leaders, preventing and curing disease, and improving human health in our community and around the world.

Importance of Data Security: Laptop thefts –an Increasing Problem with Significant Consequences

Since the last issue of the Dean's Newsletter, a press release from our Office of Communications described what is likely to be an increasing and very worrisome problem. Here is an excerpt from that release:

On August 17, 2008, an automobile belonging to a physician faculty member at the Stanford University School of Medicine was broken into and all of the contents stolen, including a laptop computer.

A thorough review of the computer backup files revealed that a small amount of medical information about some patients was stored on this computer. Although the computer was securely configured (including password protection), the patient information was not encrypted as required by Stanford University policy.

It is highly unlikely, although possible, that someone could gain access to this information. In an abundance of caution, the School of Medicine has notified patients whose information was included in this particular computer file that this incident occurred and has apologized to them for any inconvenience or concern this may cause. Letters were mailed on September 3, 2008. Only those patients potentially affected by the incident will receive letters.

The information on the laptop was collected by the physician when visiting patients for treatment in a nursing home, assisted living facility, or as a hospital or home visit. The information was for billing purposes only and was not a detailed medical record. It was a spreadsheet that included names, Stanford medical record numbers, dates of visits, ages, billing codes and limited diagnosis information related to these visits.

It did not contain dates of birth, insurance information or other personal medical information, nor did it include Social Security numbers, banking information or anything that would put individuals at risk of identity theft.

There was no indication that medical information was the reason for this theft. However, there is a very small chance that the information could be used to attempt to commit medical identity theft, which occurs when someone assumes another person's identity for the purpose of receiving healthcare services using stolen health insurance information.

The risk of medical identity theft in this instance is very low because the Stanford medical record number could not be used to obtain healthcare services elsewhere. Stanford will place a record of this incident in the charts of approximately 400 patients who could be affected and has advised these patients to keep a copy of the incident notification and to request a copy of their medical records if they have any concerns about fraudulent activity. Telephone and email assistance are available at 650-725-1828 and medprivacy@stanford.edu.

According to Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, it is estimated that more than 600,000 laptop computers are lost or stolen each year in the U.S., with more than 10,000 laptops lost every week at U.S. airports. As more people use laptops as their primary, and often sole, computing device the risk of data loss and exposure will increase. There is a similar risk associated with the use of other portable computing/storage devices, such as USB thumb drives, portable hard disks, CDs, DVDs and Smartphones (like the iPhone and Blackberry). When loss occurs sensitive information may be accessible to whoever comes into possession of the device.

The risks associated with sensitive information falling into the wrong hands are well documented, including identify theft, health insurance fraud, loss of privacy and financial loss. It should be noted that there are very clear University policies regarding data protection (see <http://adminguide.stanford.edu/63>). I would **strongly advise** that you review these policies since individuals found to have violated these policies may be subject to removal from the Stanford network, access revocation, corrective action, and/or civil or criminal prosecution. Violators may also be subject to disciplinary action up to and including dismissal or expulsion. Furthermore, any University School or Department found to have violated this policy may be held accountable for the financial penalties and remediation costs associated with a resulting information security incident.

Based on this the following recommendations are offered:

- Never leave your laptop, smartphone or portable storage device unattended (even for a moment) in a public space, especially a coffee shop, airport bathroom, or a speaker's podium. Devices left in automobiles, even in the trunk, are particularly vulnerable. Devices should be carried as hand luggage when traveling.
- Backups of data are extremely important. Portable devices have a higher likelihood of data loss, either due to rough handling, loss or theft. Without

a backup, your important data can be lost forever. Ensure that you have a backup solution in place, it has been tested, and it works.

- Unless absolutely necessary, never store sensitive information on a laptop, smartphone or other portable storage device. If you must store sensitive data on such a device, University policy states that the data MUST be encrypted. In the case of medical information (and financial information) on a lost or stolen device, California law requires us to notify research subjects and patients (regardless of the likelihood of the information being accessed) unless the information is encrypted.
- While there is no single encryption method available that works for all situations on all devices, there are a number of free solutions available, from encrypting a single file to encrypting your whole hard drive. Per Drs. Lowe and Ferris, School of Medicine has recommendations for encryption at <http://med.stanford.edu/irt/security/protecting/laptops>. Contact your local IT support person to help you choose and implement the encryption solution that best fits your needs. You can also contact the School of Medicine (IRT) Service Desk at 725-8000 for advice and support. In the event of a lost or stolen laptop, smartphone or other portable storage device, contact the School of Medicine Privacy Office at 725-1828.
- You can also find more general information about mobile computer security at http://www.stanford.edu/group/security/securecomputing/mobile_devices. Additionally, you can find detailed technical guidelines on encryption at: https://www.stanford.edu/dept/hipaa/policy_university/security/sg_encryption.
- Again, if identifiable patient or research subject health information is stored on a laptop or any other removable media (e.g., USB drive, CD, portable hard drive), that information must be encrypted. (Stanford University policy: https://www.stanford.edu/dept/hipaa/policy_university/security/computer-storage_device).

Construction and Safety Issues and Concerns

I am sure that I don't need to tell anyone about all the construction events and challenges underway with the completion of the "Connectivity Project" (new loading dock and tunnel system), the Li Ka Shing Center for Learning and Knowledge (whose "steel phase" will be completed in the next weeks and will be capped off by its red roof!), and the large foundation being dug for SIM1 (whose still phase will begin in October). With all of this going on, you may have also observed the new enclosed pedestrian pathway from the Via Ortega and Campus Drive intersection to the sidewalk along the Clark

Building. While it may be tempting to do otherwise, it is important for pedestrians to use this walkway and, more importantly, to stay out of the very limited area for delivery and construction vehicles that is right next to it. Also, I must underscore that bicycles are prohibited from riding in this pedestrian pathway. Accordingly, for everyone's safety, if you are coming through this area and have a bicycle, please get off your bike and walk it to the pedestrian path until you reach the Clark Center sidewalk. With this in mind – and for your safety and that of your colleagues - I have been advised by our Facilities Group and the Construction team to ask you to please observe the following:

The area formerly known as the School of Medicine parking lot south of Fairchild Science and West of the Clark Center is now a CLOSED construction lot open only to authorized construction related personnel and both construction and School of Medicine delivery vehicles and personnel. It is critical that for both safety reasons and to expedite construction that no other vehicles try to use this lot and that bicycles and pedestrians only travel in the marked areas.

According to Maggie Saunders, feedback is continuing to be received and recommended changes will be posted on the LKSC website (see: <http://lksc.stanford.edu>). New signage and postings for safe circulation will go up over the next week and we hope that this will improve the safety and traffic in the areas.

Of course I am sorry about all these inconveniences that arise with major construction – but hopefully these will be offset with the new LKSC and SIM1 when they are completed in 2010. These will certainly be followed by a number of other major construction projects at the School and hospitals during the next decade – so continued awareness of safety and cooperation among walkers, cyclists and construction teams will be needed for many years to come. Your cooperation is deeply appreciated!

Awards and Honors

Dr. Denise Monack, Assistant Professor of Microbiology and Immunology, has been selected as the Terman Fellow for the School of Medicine. Dr. Monack will now receive \$125,000 per year for the next three years. Congratulations, Dr. Monack.

John Cooke, MD, PhD, Professor of Medicine (Cardiovascular Medicine) and his research group have received the annual "Best Research Award" from the Peripheral Arterial Disease Coalition, in recognition of his group's discovery of a novel biomarker for PAD using SELDI-TOF proteomic profiling (Wilson et al, *Circulation*, 2007) The award will be presented at the Coalition's annual meeting in Washington DC on Sept 8, 2008. The PAD Coalition is a non-profit alliance of 75 leading health organizations, health professional societies, and government agencies including the National Institutes of Health that have united to reduce the morbidity and mortality associated with PAD (<http://www.PADCoalition.org>). Congratulations, Dr. Cooke.

Dr. Bilal Shafi, a recent graduate of the Biodesign Innovation Program, has been recognized by *Technology Review* magazine as one of the world's top innovators under the age of 35 for his work in medical device development. The **TR35** honors an elite group of accomplished young innovators that are poised to have a dramatic impact on the world. Dr. Shafi has recently returned to complete his residency at the University of Pennsylvania, and will be honored at the EmTech Conference at MIT in September. Congratulations, Dr. Shafi.

Appointments and Promotions

- **Michael Champeau** has been promoted to Adjunct Clinical Professor of Anesthesia effective 9/1/08.
- **Charles DeBattista** has been promoted Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 8/01/08.
- **Robert L. Dodd** has been appointed to Assistant Professor of Neurosurgery and, by courtesy, of Radiology, at the Stanford University Medical Center, effective 8/01/08.
- **Daniel Garza** has been appointed to Assistant Professor of Orthopaedic Surgery and of Surgery at the Stanford University Medical Center, effective 8/01/08.
- **Raphael Guzman** has been appointed to Assistant Professor of Neurosurgery at the Stanford University Medical Center, effective 8/01/08.
- **Steven Machtinger** has been promoted to Adjunct Clinical Associate Professor of Pediatrics effective 7/1/08.
- **Harise Stein** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 8/1/08.
- **Charles Wang** has been promoted to Adjunct Clinical Assistant Professor of Anesthesia effective 9/1/08.
- **Ronald W. Witteles** has been appointed to Assistant Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 8/01/08.
- **Hsi-Yang Wu** has been appointed to Associate Professor of Urology at the Lucile Salter Packard Children's Hospital, effective 9/01/08.

Dean's Newsletter

September 22, 2008

A Celebration of Stanford Faculty and Basic Science Research

It is through basic research that new knowledge is discovered, some of which helps clarify the way life and our world and universe work, and some of which can be applied to the human condition of the world we live in – and beyond. Over the years Stanford faculty have excelled in basic research, and it is through their creativity that deep contributions have defined Stanford as leading research-intensive medical school and university. Recognition of the contributions of a faculty member can take different forms. Sometimes contributions over the course of a career well spent are honored, whereas in other instances specific achievements that open new insights and pathways of investigation or that result in new innovations and transformations are acknowledged. Today and this week we celebrate the work of six Stanford faculty. One received an award granted only to very few individuals who achieve the pinnacle of science and medicine; two will be recognized as new pioneers and three as new innovators.

Dr. Stanley Falkow, Robert W. and Vivian K. Cahill Professor in the Department of Microbiology & Immunology, will receive the Lasker-Koshland Award on September 26th in recognition of a more than 50-year career, during which he defined the field of bacterial pathogenesis, including the unraveling of mechanisms of antibiotic resistance and the ways in which bacteria cause and spread disease (see: http://med.stanford.edu/news_releases/2008/september/falkow.html and video interview at <http://med.stanford.edu/121/2008/falkow.html>). The Albert and Mary Lasker Foundation recognized Dr. Falkow as “one of the greatest microbiologists of all time” - a distinction appreciated by the legions of students, trainees and colleagues he has taught, guided or collaborated with over the past five decades. He will receive the Lasker-Koshland Award on September 26th, when he will offer additional insights on his life journey including this one: *“I was able to follow my dream to study microbes because of my teachers. The earliest were all women who taught in public schools. I did not realize for many years that I was the beneficiary of the discrimination that for generations led many of the brightest women to find their intellectual outlet by teaching others to be what they could not.”* This remark is characteristic of Stan Falkow, conveying as it does his humility and the razor-sharp honesty, integrity and insight that have made him successful and beloved by his colleagues and students. Clearly this is a wonderful recognition for Dr. Falkow life's work, and we congratulate him.

And today, September 22nd, the National Institutes of Health announced the recipients of one of its most prestigious awards as well as the winners of a new award that recognizes new innovators. This year the NIH Director's Pioneer Award celebrates its fifth year, during which 63 scientists, including 16 today, have been recognized as “Pioneers” for their creative thinking and innovative research proposals. Two School of Medicine faculty members, Dr. James Chen, Assistant Professor in the Department of Chemical and Systems Biology, and Ricardo Dolmetsch, Assistant Professor in the Department of Neurobiology, are among the 2008 recipients. Each will receive \$2.5 million in direct

research support over the next 5 years (see http://med.stanford.edu/news_releases/2008/september/pioneer.html). With the awards to Drs. Chen and Dolmetsch, Stanford faculty have received 11 of the 62 awards since their inception. Given the level of competition for the Pioneer Award, this level of institutional success is unprecedented and speaks to the quality and creativity of our basic science faculty and the respect they have garnered from a national review committee.

In addition, the NIH announced today the recipients of its New Innovator Awards – now in their second year. This year 31 awards will be given, each providing \$1.5 million in direct costs over 5 years to each recipient. The three Stanford faculty members who are being recognized as “New Innovators” are Dr. Zev Bryant, Assistant Professor of Bioengineering, Dr. Shelli Kesler, Assistant Professor of Psychiatry and Behavioral Sciences, and Dr. Joe Wu, Assistant Professor of Medicine and of Radiology (http://med.stanford.edu/news_releases/2008/september/pioneer.html). Again, this is a wonderful record of individual and institutional accomplishment.

Clearly this is a celebration of our basic science faculty and the environment that fosters, supports and nurtures them. We are so very fortunate to have such a remarkable group of pioneers, innovators and distinguished leaders shaping our research agenda at Stanford – and creating new venues of investigation for the broader scientific community. In the midst of not infrequently disappointing news from the NIH, it is wonderful to continue to receive affirmation, with these amazing awards, of the excellence of Stanford faculty.

Update on the NIH Director’s Presentation to Congress

The wonderful news about new NIH Director Pioneer and New Innovator Awards noted above, while terrific for the individuals and for Stanford, does not diminish the impact that most faculty are now experiencing from the overall downturn in NIH funding over the past five years. I have commented a number of times about this important issue and have opined that the trend is not likely to be reversed by changes that follow the upcoming presidential elections, primarily because of the serious economic challenges we have been facing during the past year. However that forecast now pales in light of the economic news of the past 10 days and only affirms the importance of exploring additional ways of supporting our faculty and basic research programs beyond federal funding. A task force is currently examining such options and I will have more to say about that later this year or early next year.

On September 9th the NIH Director, Dr. Elias Zerhouni, testified to the House Committee on Energy and Commerce on the “National Institutes of Health Reform Act of 2006” – various components of which I have also addressed in prior Dean’s Newsletters as part of my comments on the NIH reauthorization (see: http://deansnewsletter.stanford.edu/archive/09_11_06.html#4). In his testimony to the House Committee, Dr. Zerhouni commented, “We are using new authorities to enable and expedite trans-NIH research, funded through the new Common Fund, an appropriations line authorized by the Act”. Among the projects being supported are the

Human Microbiome Project, the Epigenome Project, the Structural Biology Roadmap, and the Clinical and Translational Science Awards (CTSA).

I certainly agree that supporting these areas of investigation and development are important and will yield new knowledge and, in the case of the CTSA, will help academic medical centers enhance their clinical research infrastructure and mission. But it must also be remembered and underscored that major breakthroughs in science, and ultimately medicine, come from basic research. Thus, despite the current economic climate it is imperative that we continue to advocate for support for basic science that is predictable, sustainable and at least keeps pace with inflation or, where possible, exceeds it. Calls by some to have another doubling of the NIH budget seem ill advised given recent history, especially if not coupled with a plan to continue to support the investment in research once an upward adjustment in the federal science budget is achieved.

Despite the challenges we now face as a nation, one of our greatest areas of success has been in biomedical research and, more broadly, in science and technology. In working with the Congress and with the new Administration it will be essential to do all we can to assure that we don't unravel the 64 years of excellence that has been fostered by the NIH and that we sustain – and enhance – investments in research. I will do everything I can to carry forth that message and hope that you will do the same – with your colleagues at Stanford and throughout the nation and in concert with your professional and scientific societies and organizations.

Evolution of Clinical and Translational Science Research at Stanford University

Opportunities to conduct cutting-edge and innovative clinical and translational research depend heavily on having strong basic research programs. We are fortunate to have an incredibly strong basic science research faculty at Stanford - which must be supported in its own right and which, over time, will also contribute to discoveries and innovations that can translate from the bench to the bedside. That said, until relatively recently, Stanford was not very invested in clinical and translational research – although a number of incredibly important discoveries and innovations have been carried out by faculty working in specific disciplines and more recently, across disciplines, departments and schools.

A more concerted effort to foster translational and clinical research was envisioned in the 2002 School of Medicine Strategic Plan and, more recently, has been stimulated by our designation by the National Cancer Institute as an NCI Cancer Center and by the NIH CTSA award we received past spring, when we were one of 38 institutions to receive this award. Another key advance was a major gift by John and Jill Freidenrich to develop the Center for Translational Research in their name. These programs are each playing an important role in helping Stanford complement its excellence in basic science with comparable excellence in clinical research. But moving this agenda forward is also quite complicated.

Clinical and translational research can be challenging, takes years to complete, requires a team of investigators and support staff, is expensive, and can be difficult to fund from conventional sponsors. Because it involves human subjects, an array of important compliance issues arise that require considerable institutional knowledge and support. Moreover, most of these institutional support structures are unfunded and add to the cost and complexity of the clinical research infrastructure. Moreover, there has not been a well-developed plan to educate and train clinical investigators or to assure their success once they begin their careers. And because much clinical research is done in collaboration with industry, a complex web of individual and institutional conflict of interest issues must be considered, monitored and managed.

Thankfully, considerable progress has been made at Stanford in addressing these and a number of related issues. With the support of SPCTRM (the Stanford/Packard Center for Translational Research in Medicine, see: <http://spctrm.stanford.edu/>), annual intensive courses in the methodology for conducting clinical research are being conducted. I had the opportunity to address the fourth annual class on Monday September 8th. This year's class was comprised of individuals interested in pediatric research, albeit from a variety of medical, surgical and related disciplines. It was conducted in collaboration with the Children's Health Research Program led by Dr. Christy Sandborg, Professor of Pediatrics, along with Dr. Steve Alexander, Professor of Pediatrics and Medical Director of SPCTRM, and Dr. Phil Lavori, Professor and Chair of the Department of Health Research and Policy.

SPCTRM was launched in 2005 as a multidisciplinary service organization whose mission is to enhance the quality of clinical and translational research performed at Stanford and its affiliated hospitals by aligning organizational "service" based activities; providing education, training and mentoring to clinical research coordinators and staff; and developing an integrated research infrastructure. As detailed on the SPCTRM website, a menu of services are provided including:

- Protocol development through biostatistics and informatics consultation services
- Study budgeting
- Contracts with industry and grant sources
- Automated billing, accounting, and internal financial auditing
- Sponsor billing and study closeout
- Internal compliance monitoring
- Outpatient clinic space
- Clinical laboratory consultation and samples processing
- Study source document archiving
- Research coordinator services: education, orientation and training; health screening; competency testing
- Faculty investigator education and training
- External audit and review support
- Stanford Clinical Trials Website
- Single point of contact for clinical research issues

I also had the opportunity to speak to the SPCTRM annual workshop on

September 17th and was impressed by the number of individuals participating and their commitment to clinical research. Hopefully, with the availability of the CTSA, these services and others will be even further enhanced and enriched. Of course it also the people involved who make the programs successful, and I would like to thank, in particular, Dr. Steve Alexander, Nick Gaich, Anna Hu, Linda Walker, Peg Tsao, Jessica Meyer and Geraldine Solon for their leadership in SPCTRM. Key to these initiatives is the leadership of Dr. Harry Greenberg, Senior Associate Dean for Research, who also serves as the PI for the Stanford CTSA. While we have made progress, much remains to be done – but we have excellent leadership and an institutional commitment so that our success seems achievable.

Center for Health Policy Celebrates its 10th Anniversary

On Tuesday September 16th the Center for Health Policy and the Center for Primary Care and Outcomes Research (CHP/PCOR), both in the Department of Medicine, celebrated their 10th Anniversary with a symposium entitled: *Better Health, Lower Cost: Can Innovation Save Health Reform?* Having served on the conference advisory council, I had the opportunity to attend most of the symposium, which featured leaders from academia, government, foundations, industry and the health sector. Speakers focused on a broad array of important topics that ranged from the factors contributing to the cost of health care to the demographics that impact access and expenditures. How innovation impacts health care cost and outcome was addressed along with the necessity for reform of health care in the USA. A final section of the symposium dealt with innovation and health care in developing nations.

While the conference was impressive, more noteworthy are the accomplishments of CHP/PCOR faculty, students and staff during the past decade. These successes have been enhanced and supported by the exceptional leadership of Dr. Alan Garber, the Henry J Kaiser, Jr. Professor in the Department of Medicine. An internationally acclaimed scholar and leader, Dr. Garber has also assembled the team that now constitutes CHP/PCOR and has provided an environment that fosters creativity, collaboration and interactions across the university. So this is an opportunity not only to celebrate CHP/PCOR but also a time to recognize and thank Dr. Garber.

Respect and Tolerance in the Workplace

We initiated our program on the Respectful Workplace in May 2002 (see: http://deansnewsletter.stanford.edu/archive/05_13_02.html#1) and over the past 6 years have worked diligently to promote a work environment that is valued by faculty, staff and students. When infractions or problems have arisen, we have reacted swiftly and have tried to do all we can to continue to uphold our values and reprimand or discipline disruptive or disrespectful behavior, whether by faculty, staff or students. This includes the disrespectful behavior or interactions among individuals or groups as well as more hidden disrespect such as written communications or the defaming or desecrating of communications or rights of expression based on race, gender, sexual choice, or religion,

among others. This is something that I personally take quite seriously, and I know that other leaders in the School and the University share my concern.

Thus, I was upset to learn recently that a member of one of our student groups that participate in the Intervarsity Graduate Christian Fellowships found that a number of the posters they had placed in approved sites announcing an upcoming welcome dinner or provided contact information for those who might be interested in the organization had been removed from medical school buildings. This is unacceptable and inappropriate and defies freedom of expression and communication.

I hope that the removal of these posters and fliers was inadvertent and not evidence of discrimination or intolerance. But I did want to take this opportunity to let you know that this act has taken place and that I sincerely hope and expect that it will not reoccur. Thank you.

Update on CME Policy: The Frequently Asked Questions

In the August 25th Dean's Newsletter I reported on our new policy on the use of industry support of Continuing Medical Education (CME) (see http://deansnewsletter.stanford.edu/archive/08_25_08.html#1). This policy, which became effective September 1, prohibits new direct commercial support of specific CME activities. Since the announcement of the policy, Associate Dean for CME Dr. Robert Jackler and Executive Director Terry O'Grady have prepared a very helpful set of FAQs (i.e., responses to "frequently asked questions") that provide additional guidance about the use of the policy (<http://cme.stanford.edu/>). I encourage you to consult these FAQs and to work closely with the Center for CME in planning future CME activities in your department.

Touchdown Space for Emeritus Faculty

As we go forward with our various new construction and renovation plans, we are looking for space that emeriti faculty can use when they come to campus. With that in mind, we would like to invite emeriti faculty to use the "hotel" or "touchdown" space, affectionately known as "Club Med," as a central location to work while on campus. Club Med is located on the garden level of the Alway building, directly below the dean's office, and is accessed from the stairs in the dean's courtyard. Additionally, elevators located in the Always and Grant buildings, will provide transportation to this level. Club Med is a comfortable, well-equipped space that can accommodate more than two dozen people at a time; included are lockers for daily use, terminals that boot up either Mac or PC, space for laptop plug in, wireless access to the network, office supplies, copying and printing, faxing and scanning. More details on the space, policies, contact information, and directions can be found at <http://med.stanford.edu/smp/hotelling/campus.html>. Both faculty who are located off campus and emeriti faculty are welcomed to use this hotel space. Please feel free to stop by and take a tour--the office is staffed during working hours.

Thanks to Professor Ellen Porzig

For the past 8 years, Dr. Ellen Porzig, Professor (Teaching) in Developmental Biology, has served as Associate Dean for Graduate Education. Beginning October 1, 2008, Professor Porzig will be returning to full time teaching in the Department of Developmental Biology and to upcoming sabbatical leaves. She will also continue to serve on the Stanford School of Medicine Alumni Board of Governors, the Diversity Cabinet, the Advisory Board of the Stanford Medical Youth Program, and the faculty advisory committees for the Masters of Science in Medicine and the Masters of Human Genetics-Genetic Counseling.

I would like to thank Dr. Porzig for her many accomplishments as Associate Dean for Graduate Education. Indeed, listing Dr. Porzig's accomplishments highlight the depth and breadth of her involvement in graduate education across the School of Medicine as well as in many of the programmatic initiatives that have taken place in recent years.

The primary mission of Biosciences graduate education is to maintain Stanford's leading role in excellence and diversity. As Associate Dean, Dr. Porzig's major responsibilities have included:

- Oversight and management of admissions to the 12 Biosciences Ph.D. programs
- Serving as cognizant Dean for the University in the mandated reviews of the Inter-Departmental Programs in Biomedical Informatics, Cancer Biology, Neurosciences, Immunology, Epidemiology and Health Services Research, and
- Management of the Office of Graduate Education, including Biosciences diversity programs.

Dr. Porzig's commitment to recruiting outstanding applicants, improving the efficiency and accuracy of the Ph.D. admissions process, and keeping our diversity commitments central to this process has been fundamental to the success of our graduate education programs. Working closely with the Committee on Graduate Admission and Policy (CGAP), Dr. Porzig made improvements in the admissions process and in Stanford's success in attracting the well-qualified applicants to whom admission was offered. Applications increased in this period by more than fifty percent. Particularly meaningful to me were Dr. Porzig's significant efforts, along with those of former Assistant Dean Anika Green (recently promoted to the University position of Director of Educational Programs) in substantially increasing our success in recruiting underrepresented minority students to Ph.D. programs in the Biosciences. During her tenure, Dr. Porzig led highly successful recruitments of outstanding students to Stanford's graduate Biosciences programs and to careers in science.

In addition, Dr. Porzig has served as Principal Investigator for the Amgen Foundation grant that for the past two years has provided much of the support for the Stanford Summer Research Program. This program allows talented undergraduate researchers from across the country to train in the laboratories of Stanford Biosciences faculty members. More than 20 former participants in this Program have entered Stanford's

Ph.D. and M.D. programs. She has also supported faculty with interdisciplinary courses, played an important role in two new graduate programs (Masters in Genetic Counseling and Masters in Medicine), and created teaching awards to recognize graduate student educators, among many other achievements.

Importantly, throughout her years as Associate Dean, Dr. Porzig continued her commitment to teaching in Developmental Biology and other medical school programs, for which she received a number of teaching honors, including the Henry Kaiser award for excellence in pre-clinical teaching and the Walter Gores Award for Excellence in Undergraduate or Graduate Teaching. The Gores award is “Stanford University’s highest teaching honor.”

I want to thank Dr. Porzig and wish her continued success in her teaching roles.

Announcements

Dr. Audrey Shafer asked me to let you know about two important upcoming events:

- The first is the ***Jonathan King Lecture*** that will be given this year by *Dr. Danielle Ofri*, Editor-in-Chief of the Bellview Literary Review. Her lecture entitled “*Tools of the Trade: Old and New Technologies in Medicine*” will be given on Tuesday, October 14th, at 5 pm in the Clark Center Auditorium. A reception will follow. For further information contact Paula Bailey at pbailey@stanford.edu.
- Second, on Wednesday October 8th, Linda and Michael Hutcheon will give a presentation on the “***Last Works, Late Style: The Case of Benjamin Britten***” – addressing opera, mortality, illness and creativity. It will be held in the Wallenberg Theater at 5:30 pm. A reception will follow. For additional information contact David Palumbo-Liu at Paloliu@stanford.edu.

Awards and Honors

- ***Mark Genovese***, Associate Professor of Medicine (Immunology and Rheumatology) will receive the Kunkel Young Investigator Award from the American College of Rheumatology at its national meeting in late October. Please join me in congratulating Dr. Genovese.
- ***Bilal Shafi***, former Fellow from the Biodesign Innovation Program at Stanford, has just received the TR35 award from Technology Review magazine; he was selected from more than 300 nominees as one of the world’s top innovators under the age of 35 for his work in medical device development. Congratulations, Dr. Shafi.
- ***Paul Sigala***, Graduate student in Biochemistry, has been selected to receive a Lieberman Fellowship; this Fellowship honors the qualities of outstanding scholarship, teaching and university service. Please join me in congratulating Dr. Sigala.

- **Erik Corona**, a graduate student in Biomedical Informatics (BMI), has just received the new Linda and Amin Miller Fellowship awarded to graduate students. Erik works in the translational bioinformatics lab of Dr. Atul Butte, studying the role of evolution in human disease, using the HapMap project.
- **Thomas Rando**, Associate Professor of Neurology and Neurological Sciences, was one of two recipients of the 2008 Breakthroughs in Gerontology Award sponsored by the Glenn Foundation for Medical Research and the American Federation for Aging Research. This award provides funding for a small number of pilot research programs that may be of relatively high risk but which offer significant promise of yielding transforming discoveries in the fundamental biology of aging.

Appointments and Promotions

- **Craig Albanese** has been reappointed to Professor of Surgery (Pediatric Surgery) at the Stanford University Medical Center, effective 9/01/08.
- **Vivek Bhalla** has been appointed to Assistant Professor of Medicine (Nephrology), effective 9/01/08.
- **Michael Fredericson** has been promoted to Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 9/01/08.
- **Jaimie M. Henderson** has been promoted to Associate Professor of Neurosurgery, and, by courtesy, of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 9/01/08.
- **Mickey C-T Hu** has been appointed to Associate Professor of Obstetrics and Gynecology, effective 9/01/08.
- **Laura J. Johnston** has been promoted to Associate Professor of Medicine (Blood and Marrow Transplantation) at the Stanford University Medical Center, effective 9/01/08.
- **Jonathan W. Kim** has been appointed to Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 9/01/08.
- **Y. Joyce Liao** has been appointed to Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 9/01/08.
- **Alan C. Pao** has been appointed to Assistant Professor of Medicine (Nephrology), effective 9/01/08.
- **Rafael Pelayo** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 9/01/08.
- **Terence D. Sanger** has been appointed to Associate Professor of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 9/01/08.
- **Barbara Sourkes** has been reappointed to Associate Professor of Pediatrics and, by courtesy, of Psychiatry and Behavioral Sciences at the Lucile Salter Packard Children's Hospital, effective 9/01/08.
- **Phillip C. Yang** has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 9/01/08.

Dean's Newsletter

October 6, 2008

Preparing for the Future

Individually and collectively we are all trying to understand and react to the financial crisis gripping the United States and global economies. The implications of the rapidly unfolding events and proposed remedies on personal savings, investments, and retirement plans, as well as the solvency of our institutions, workplaces and communities leave much uncertainty. As noted in recent issues of the *Chronicle for Higher Education* and in the October 4th *Boston Globe*, colleges and universities are assessing the impact of the current crisis and how it may affect current and future plans. Some have chosen to freeze new hiring or to defer on-going or planned construction projects, and all anticipate a downturn in endowment returns and other sources of funding.

We are also assessing our current and future plans, and I want to share an update with you with the understanding that any forecasts we make now may change, even dramatically, depending on how the local and broader economic conditions evolve (or really devolve). As I have shared in previous communications, the sources of the Medical Schools revenues are predominantly sponsored research awards and contracts (from public and private entities), clinical income, income from endowment, tuition and gifts. Of our three major missions, education and research are both “cost centers” and require other sources of institutional support to make them whole. Historically these sources have been largely clinical income, endowment and gifts.

I have written numerous times about the challenges we and other academic medical centers and research institutes are facing as a result of the declining federal support for biomedical research. As you know, the flat funding for the NIH (which has not kept pace with inflation and thus has led to a serious loss of purchasing power) that has occurred since 2003 is already impacting most medical centers and universities. Stanford is not an exception to this downturn, as we have experienced declines in our NIH funding in the third and fourth quarters of 2008 (we are finalizing the data now). As you also know, we have been hoping that the increasing bi-partisan support of the NIH for biomedical research – as well as for the NSF and other federal agencies supporting the physical and engineering sciences – might herald at least inflation level funding for sponsored research in the next several years.

However, we now need to anticipate that almost regardless of the level of commitment of the next Administration to basic and translational research, the serious economic crisis that is unfolding may make this difficult to accomplish not only in the next couple of years, but possibly for many more to come. That would clearly be bad news since our faculty are so dependent on sponsored research funding for their research as well as for portions of their personal compensation and are already feeling the strains of the past 5 years of reduced support. While funding from the California Institute of Regenerative Medicine will partially compensate for this reduction in NIH support, this support impacts only those who are working in stem cell biology – and this source of funding will end when Proposition 71 terminates in 2014.

Notably, we have already been working on how to develop a more diversified funding portfolio that would support our investments in research and education at a time of constraint in federal support for research. Indeed, this was an important initiative emanating from our 2008 Strategic Planning Retreat, and a number of ideas and plans are being put together. However, some of the most important options and opportunities – namely, creating more professorships to help support our research faculty and raising more philanthropic support for graduate student education, while still among my highest priorities, will surely be more difficult to accomplish given the current financial landscape.

Clinical income is another important source of support for faculty who have patient care as part of their responsibilities and is also a traditional source for investing in the academic missions of medical center. It is hard to predict what will happen on this front, although we are all well aware that the Medicare Trust Fund is already in jeopardy. It is likely that there will be efforts to address Medicare in the next several years, although some of the solutions likely to be proposed will include reduced support for graduate medical education by Medicare – which would also have serious implications for academic medical centers.

And despite the outstanding achievements of the Stanford Management Company in overseeing the university's endowment (which includes the School of Medicine's endowment) it is obvious that the value of the endowment will decline, although how much that will be is uncertain. Regardless, that will impact another important source for supporting faculty, education programs, research and facilities. Further, unless the crisis in credit resolves soon, the cost of borrowing and even using debt financing may be impacted.

We completed the plans for our FY09 budget in August, and we have been assessing whether we need to make changes in the funding allocations. At this time we have decided that we will stay the current course, but we recognize that this may well change as the economic picture becomes clearer in the next months and year(s). That said, we anticipate that our revenue sources (especially sponsored research, income from endowment, gifts) will almost certainly be more challenged in the next year(s) and that this will require modifications. As you know, we have been continuing to invest in the sequential phases of our Strategic Plan, *Translating Discoveries*, and, while we have made considerable progress to date, we will obviously be assessing the pace of future investments.

As you also know and see every day, we have considerable construction going on – in fact nearly \$350 million for the Connectivity Project (new loading dock, tunnels and infrastructure to support the future of the medical school), the Li Ka Shing Center for Learning and Knowledge and Stanford Institutes of Medicine. Of these, the Connectivity Project is scheduled for completion in November of this year and both the LKSC and SIM1 will be completed in 2010. Based on our financial planning models, we do not anticipate a change in the completion of these buildings. But we will obviously be

examining the pace and timeline for future construction projects – since these are so sensitive to philanthropic support as well as institutional resources. And of course we must give priority to the funding for the new Stanford Hospital, which is so critical to our future as an academic medical center.

In sum, we face many challenges but I remain optimistic. We have made a lot of progress, and we have incredible students, faculty and staff and a great story to tell. We benefit from a strategic plan that has been well thought out and that helps chart our future course. And while we will certainly need to make adaptations, I feel confident that, barring a true economic meltdown that is uncorrectable, we can succeed, even if it takes longer than we would like to accomplish all of our goals. But we will need to work together, communicate often and do all we can to preserve what we have accomplished and seek creative ways to continue to move Stanford forward.

Welcoming New Biosciences Students and Preparing for Careers in Academics

On September 22nd Dr. John Pringle, Senior Associate Dean for Graduate Education and Postdoctoral Affairs, and I welcomed the incoming Stanford Bioscience Graduate Students. Once again we are so fortunate to have a wonderfully talented group of students who will be pursuing PhD (as well as Masters) degrees in the Biosciences and Bioengineering. It is our deep felt hope that many of these students will successfully pursue careers in academics and research, although we are aware that a number will choose other career pathways. I take note of the interesting *Science Focus* article “And Then There Was One” that appeared in the September 19th issue of Science (see: <http://www.sciencemag.org/cgi/content/full/321/5896/1622>). This article reviewed the individual career pathways of the 30 students who entered the program in molecular biophysics and biochemistry (MB&B) at Yale in 1991. Of the 26 who completed their PhD, the startling conclusion is that only one is a tenured faculty member today, although one other graduate of the program is in a tenure track position, four are in academic research positions, and one each is in academic teaching or administrative positions. Of the 18 students who did not pursue or stay in academia, 11 are in bio-industry and four are in other career paths.

On Thursday October 2nd I gave a seminar presentation and led a discussion with current graduate students and postdocs about the pathways for career development in academia. I polled the students before beginning my comments to query how many were interested in pursuing academic careers. Of the approximately 75 participants, slightly more than half indicated that they aspired to an academic career. This is higher than the numbers presented from Yale (see above), but of course this reflects aspiration and not reality. While I presented an honest assessment of the issues that help define successful entry as well as advancement in an academic center like Stanford, we must all be concerned about whether we are truly preparing our current students for the careers they desire. This, of course, must include preparation for careers not only in academia, but also in industry and other domains. This was one of the reasons for establishing the Career Center a few years ago.

Separately, but in a related way, we are focusing on the career development of junior and mid-career faculty and will be coming forth with additional recommendations on how to do a better job to support our faculty. Clearly these recommendations will have relevance to our graduate students since the challenges they face are part of a continuum of events and hurdles that impact pre-doctoral students, post-doctoral trainees and faculty members. Career development across the span of academic careers will also be a topic for our Strategic Planning Retreat in February 2009. While I think we have made strides in these areas, the data we are currently gathering suggests that we have much work to do and that improvement will require individual, local and systemic changes. But given the importance of our students to the future of science and the investments we make in recruiting faculty to Stanford, it is imperative that we do all we can to better support successful pathways. I fully understand that the breadth, diversity and complexity of a university environment make this challenging, but we need better success. While I do not make a value judgment about the percent of entering Yale PhD students who succeed in academia, I do believe that we must be true to our mission. To that regard I would hope that our yield and success in promoting academic careers is higher and that if students choose a different pathway it is because they proactively sought it and not because we didn't equip or prepare them for the one they really desired.

SIM1: Now The Lorry I. Lokey Stem Cell Research Building

On February 27, 2007 we were pleased to announce that Lorry Lokey made a \$33 million gift for the construction of the Stanford Institutes of Medicine I building. I am truly thrilled to announce today that Mr. Lokey has now increased his gift to \$75 million and that we will be naming the facility the ***Lorry I Lokey Stem Cell Research Building*** (http://med.stanford.edu/news_releases/2008/october/lokey.html and <http://www.sfgate.com/cgi-bin/article.cgi?f=/c/a/2008/10/06/BA0M13BU4V.DTL&tsp=1>). This is wonderful news indeed.

Over the years that I have had the pleasure of getting to know Lorry Lokey I have been deeply impressed by his intelligence and personal commitment to using his personal financial resources to truly impact the world and make it better. He has been focused in particular on education at the high school and university level and on research – in the USA and in Israel. His decision to provide the initial core funding for SIM1 enabled us to gather additional support for this exciting building from other private donors as well as from the California Institute of Regenerative Medicine. Indeed our incredible success with CIRM funding was aided considerably by Lorry's seminal gift. His more recent decision to increase his funding commitment speaks to his personal conviction that stem cell research is incredibly important and that he wants to do all he can to help support its development – at both a basic and an applied level. Accordingly, it is with heartfelt pleasure that we can now name SIM1 in honor of Lorry Lokey.

Quite amazingly, as I have (over and over again) offered my personal thanks and those of our colleagues to Lorry Lokey for his incredible generosity, he has both humbly and in remarkably touching manner thanked us for giving him the opportunity to make this gift.

What an incredible individual. Even though human cloning is (and should remain) anathema, the world would be a much better place if it had more Lorry Lokeys in it.

We will be officially celebrating the groundbreaking of SIM1 – now the Lorry Lokey Stem Cell Research Building – on Monday, October 27th.

AAMC Board Meets with Senator Grassley

On Thursday September 25th, the Administrative Board of the Association of American Medical Colleges (AAMC), of which I am a member, visited Capitol Hill for a meeting with Senator Charles Grassley (R-Iowa). As you know from prior communications, Dr. Grassley has been investigating a number of issues that impact universities and non-profit organizations. A major focus of his investigations has been on individual and institutional conflict of interest. He is also the author of the Physician's Sunshine Legislation, which would compel the pharmaceutical and device industries to publicly list any payments to doctors as a means of comparing that information to what doctors and faculty list in their annual conflict of interest disclosures. He noted that he is investigating some 30 high profile faculty at 20 medical centers. One of these investigations was revealed in articles the October 3rd *Wall Street Journal* and the October 4 *New York Times* (<http://www.nytimes.com/2008/10/04/health/policy/04drug.html?em>). At this point it is important to view the claims made in these articles as allegations, since institutional reviews are underway. That said, this is another example of the increased attention being focused on conflict of interest issues and a reminder to faculty across the USA to be completely transparent and accurate on their annual (and transactional) conflict of interest disclosures.

Over the years Stanford has developed important policies for conflicts of interest related to research, education and patient care. Stanford is also one of a minority of universities with a written "Institutional Conflict of Interest Policy." But based on recent observations and the changing landscape in academia, revisions of our institutional conflict of interest policy are in progress to assure that principles and procedures are in place to ensure that research involving human subjects is conducted without untoward influence from either University investments or from the personal interests or holdings of key institutional leaders. The President of the University is leading this revision process, and further details will be forthcoming in the next months.

Dr. Sherry Wren Named Associate Dean for Academic Affairs

I am pleased to join Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, in announcing that Dr. Sherry Wren, Professor of Surgery, has been appointed Associate Dean for Academic Affairs, effective August 1, 2008. She will join Dr. Maurice Druzin (Obstetrics and Gynecology) Dr. Lucy Tompkins (Medicine), who will be continuing in their roles as Associate Deans for Academic Affairs during the 2008-09 academic year.

Dr. Wren has had a distinguished career since she joined Stanford in 1997. She has served as Chief of General Surgery and Associate Chief of Surgical Services at the Palo Alto Veterans Affairs Health Care System and since her arrival, the surgical service has grown and improved dramatically thanks to her strong and excellent leadership. Her research interests are primarily in surgical oncology, especially gastrointestinal cancers, and she has an active program in research that focuses on colorectal cancer screening strategies. She has published nearly 70 peer-reviewed journal articles, has served on two editorial boards and is a site reviewer for the National Fellowship Council. She has extended her interest in access to care into volunteering for Doctors Without Borders and, as in previous summers, will be spending the next six weeks on a surgical mission for that organization. I recently attended a seminar she gave about her experience in the Congo this past summer (see: <http://med.stanford.edu/mcr/2008/wren-1001/>) and came away with tremendous respect for her personal and professional courage and humanism.

Dr. Wren's research and patient care activities are complemented by award-winning teaching. Among numerous honors was her selection by the Association of Education for the National Outstanding Teacher Award for Excellence in Surgical Education. She has also been an exemplary citizen of the School. Since 2000, she has been deeply involved through extensive committee work on the evaluation, design, and implementation of the new curriculum for the School of Medicine and, for the past two years she served with distinction as the elected Chair of the School of Medicine Faculty Senate.

As Associate Dean, Dr. Wren will be responsible (in collaboration with Ellen Waxman, Director of Faculty Relations) for handling faculty complaints and sensitive issues that have the potential to turn into formal grievances. In addition, working with Dr. Stevenson and senior members of his staff, she will develop and implement School-wide policy initiatives and she will serve as an *ad hoc* member of the School's Appointments and Promotions Committee.

Please join Dr. Stevenson and me in welcoming Dr. Wren to her new role in the Office of Academic Affairs.

Fast FAC Update

At the October 3rd Executive Committee meeting, Michael Halaas, Associate Chief Information Officer, and Jane Volk-Brew, Office of Academic Affairs Business Owner Representative for the FAST|FAC project, provided an update and demonstration of this project. FAST|FAC is a system for managing the faculty appointments and promotions processes. It has its origins in 2005, when I appointed a Faculty Task Force, chaired by Dr. Robert Jackler, Professor and Chair of Otolaryngology, together with Dr. Kathy Gillam, Senior Advisor to the Dean, to develop policies that might streamline our academic appointment and promotion system and that would result in an electronic system for filing, managing and monitoring faculty academic actions. In 2006 the Task Force recommended the creation of a web-based system to improve the speed and accuracy of long form assembly and review.

The resulting **Faculty A&P System Tracking File Assembly Completion** system (FAST|FAC) was initiated in 2007 through a collaborative effort between Information Resources and Technology (IRT) and the Office of Academic Affairs (OAA). The project is advised by an implementation committee comprised of Dr. David Stevenson, Dr. Jackler, Dr. Gillam, Judith Cain, and Jason Irwin. The advice and feedback of department and division faculty affairs administrators has been instrumental in the development process. The development team is led by Michael Halaas and includes, in addition to Jane Volk-Brew, Don Mitchell, Sharon Seliga, Devi Meyyappan and Rose Barone.

FAST|FAC was launched in March 2008 for use in all professorial promotions and reappointments in the School of Medicine. The process to appoint and promote faculty requires a complex and rigorous series of steps to gather and review evidence about an individual's performance, achievements and potential. FAST|FAC has translated this process from paper to the web and provides a highly secure environment to track each step of the process, collect documents and data, assemble review committees, notify participants about status, and report metrics on the efficiency of the overall process. The system incorporates University and School policies and procedures to increase the quality of the information collected and a greater degree of transparency to individuals involved in managing the review actions of their faculty to enable timely process completion.

New functionality is being released in phases. In the coming year the system will enable departments to process appointments for new members of the professoriate and offer an interface for prospective candidates to apply online. If you would like more information about FAST|FAC please contact Jane Volk-Brew in the Office of Academic Affairs (volkbrew@stanford.edu). Thanks to the development team and departmental faculty affairs staff who have brought FAST|FAC to its current level of functionality. I look forward to seeing its further progress in the months ahead.

Upcoming Events

Fall Forum on Community Health & Public Service

Wednesday, October 22nd

5:00 pm - 7:30 pm

Frances Arrillaga Alumni Center

The Fall Forum on Community Health & Public Services will be held on Wednesday, October 22, at the Frances Arrillaga Alumni Center, from 5:00 pm to 7:30 pm, to celebrate student contributions to community health through public service and community partnership research. Dr. Lisa Pratt, a dedicated community leader and currently the medical director for San Quentin State Prison, will be the keynote speaker. The event is free and open to the public. For information please contact the Fall Forum Coordinators Ruo Peng Zhu (rzhu@stanford.edu) or Alisa Mueller (alisamueller@stanford.edu).

Stanford Health Policy Forum: “How War is Changing Medicine”

Wednesday, October 29th

11:00 am – 12:00 pm

Clark Center Auditorium

Thanks to the leadership of Dr. Keith Humphreys, Professor (Research) of Psychiatry and Behavioral Sciences, and Ryan Adesnik, Director of Federal Relations, the 1st Stanford Health Policy Forum will be held on October 29th from 11:00 am to 12:00 pm in the Clark Center Auditorium. The first session is entitled "How War is Changing Medicine" and features Dr. Kenneth Kizer, Former Under Secretary of Health in the Department of Veterans Affairs, as the Keynote speaker. The panelists will be Dr. Craig Rosen, Assistant Professor of Psychiatry and Dr. Eugene Carragee, Professor of Surgery. Space is limited, so if you are interested in attending please RSVP to: Lucy.Wicks@Stanford.edu.

Skills Building Workshop: “Negotiating”

Thursday, November 20

5:30 – 8:30 pm

Always Building, Room M-112

On Thursday, November 20th the Office of Diversity & Leadership will continue the Skills Building Workshop series with "Negotiating." Back by popular demand, Margaret A. Neale, Professor in the Graduate School of Business, will present information on negotiating and will moderate a highly interactive session covering the following topics: misconceptions of negotiating, barriers in social interaction, and costs of negotiating vs. not negotiating. The purpose of this workshop is to provide participants with a set of negotiation tools that can enhance the quality and rationality of their agreements.

Registration for this workshop is open to all faculty, including CE's and Instructors. Please visit the ODL website at <http://med.stanford.edu/diversity/> for details on registration and location as well as other events offered by the Office of Diversity and Leadership.

Awards and Honors

- **Dr. Ben Barres**, Professor and Chair of Neurobiology and Professor of Developmental Biology and of Neurology and Neurological Sciences, has been selected by the Society for Neuroscience as the winner of the 9th annual Mika Salpeter Lifetime Achievement Award, which is given to a scientist to has "sustained exceptional achievement in neuroscience" and who has "exhibited an unusual dedication to facilitating the mentoring and entry of young women into neuroscience or to the advancement of women in neuroscience". Dr. Barres is not only a superb scientist but his commitment to diversity and career development – particularly for women – is nonpareil. This award is a wonderful and richly deserved recognition of his contributions as a neuroscientist and career advocate. Congratulations to Dr. Barres

- **Dr. Atul Butte**, *Assistant Professor Medicine and of Pediatrics, and by courtesy, of Computer Science*, has been selected as the 2008 recipient of the American Medical Informatics Award (AMIA) New Investigator Award. This award recognizes an individual for early informatics contributions and significant scholarly contributions on the basis of scientific merit and research excellence. The criteria for nomination include significant scientific productivity in informatics prior to reaching eligibility for fellowship in the American College of Medical Informatics; multiple significant scientific publications and demonstrated commitment to AMIA. This is a wonderful award and recognition of Dr. Butte's major accomplishments and contributions. Please join me in congratulating Dr. Butte.
- **Dr. Ron Levy**, *Robert K and Helen K Summy Professor of Medicine*, has been named the winner of the American-Italian Cancer Foundation Award for Scientific Excellence in Medicine for his work (along with Dr. Lee Nadler) that led to the successful development of monoclonal antibodies for the treatment of lymphomas. I am also particularly pleased to recognize Dr. Levy's award since I am a past recipient (1991) of this award. Congratulations to Dr. Levy on another important recognition of his contributions to cancer research.
- **Dr. Gary Schoolnik**, *Professor of Medicine and of Microbiology and Immunology*, informed me that he has received a major (nearly \$20 million over 5 years) award from the NIH for his project entitled "A Systems Biology Approach to Infectious Disease" which is focused exclusively on tuberculosis. Dr. Schoolnik is an outstanding physician-scientist and this peer-reviewed award is another affirmation of his excellent work
- **Dr. Fenando Mendoza**, *Professor of Pediatrics* at the Lucile Salter Packard Children's Hospital, was honored on September 27th at the Gardner Family Health Services 40th year Gala Event. As one of Gardner's founding members, Dr. Mendoza's commitment and visionary work has added to Gardner's mission of providing high quality comprehensive health and behavioral care nationally. Congratulations, Dr. Mendoza.
- **Dr. Eugene J. Carragee**, *Professor of Orthopaedic Surgery*, has been selected by the North American Spine Society to receive the 2008 Leon Wiltse Award for excellence in leadership and/or clinical research in spine care. He will be recognized at the Annual Meeting and the 2008 award winners in an upcoming issue of *SpineLine*. Congratulations to Dr. Carragee.
- **Dr. Harry Greenberg**, *Joseph D. Grant Professor and Senior Associate Dean of Research*, is the recipient of the Albion Walter Hewlett Award, designed to honor an exceptional physician with ties to Stanford. As part of the award, he will be the speaker at Medicine Grand Rounds on Wednesday, November 12th at 8:00 am in the Braun Auditorium, and will be honored at the Hewlett Award Dinner event

that same day. Congratulations to Dr. Greenberg.

Appointments and Promotions

- **W. Scott Lock** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology, effective 10/8/08.
- **Cynthia F. Woo** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology, effective 10/8/08.
- **Steven Chang** has been promoted to Professor of Neurosurgery at the Stanford University Medical Center, effective 10/01/08.
- **Loretta Chou** has been promoted to Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 10/01/08.
- **Mark C. Genovese** has been promoted to Professor of Medicine (Immunology and Rheumatology) at the Stanford University Medical Center, effective 10/01/08.
- **Graham H. Creasey** has been appointed to Professor of Neurosurgery at the Veterans Affairs Palo Alto Health Care System, effective 10/01/08.
- **Mike Yao** has been appointed to Associate Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center and the Veterans Affairs Palo Alto Health Care System, effective 10/01/08.
- **Brian Rutt** has been appointed to Professor of Radiology, effective 10/01/08.
- **Elisabetta Viani-Puglisi** has been appointed to Assistant Professor (Research) of Structural Biology, effective 09/01/08.

Dean's Newsletter October 20, 2008

Science, Healthcare and the Presidential Elections

Everyone's attention has understandably been riveted on the extraordinary events impacting the global economy in general and the United States economy in particular. The ups and downs (really downs) are affecting virtually every aspect of the world as we thought we knew it –institutions of higher learning, medical centers, businesses, homes and personal savings. Fears for the future are increasingly more commonplace, and most of the reassurances we have heard from public leaders have not been, in fact, reassuring.

There now seems little doubt that the events now rapidly unfolding will reset our national compass and recalibrate our expectations at nearly every level.

While it would be foolhardy for any one of us to pretend we know when the current volatility will give way to some stability, I also recognize that each of us, in our own way, is looking for guidance and effective leadership. Throughout the medical school and medical center there are hundreds of faculty leaders who run research laboratories as well as clinical, education or administrative programs; there are students who lead societies or organizations; staff who lead units or support teams. Each individual and every leader play an extremely important role at times of uncertainty and crisis. From my vantage point, it is easy to lead when resources are plentiful. It is when a crisis arises or resources are constrained that leadership matters most. In those times, it is important that we serve as institutional stewards, doing all we can to preserve and support each other and the programs we are responsible for – which, by definition, are so important to our community locally and beyond.

In addition to our institutional responsibilities, we each have personal ones as well. And one of the most important of those responsibilities will be exercised on November 4th when we vote for the President, Members of Congress and state and local candidates and initiatives. There seems little question that this is a time for measured, steady and well-considered leadership as well as change. And while we are all focused on the current chaos, there is of course much more at risk as well.

During the past nearly eight years we have witnessed a polarization of science and politics. This is true in the nation's Executive Branch, but it extends far beyond that. The USA has been a global leader in science and technology, including the biomedical and life sciences. But the erosion of respect for science, coupled with the real declines in federal support for the biosciences as well as the physical and engineering sciences, now seriously compromises our global leadership. This includes not only support for research but also the shrinking investments needed to fuel biotechnology and the industries so essential to translating new knowledge to application. We also face science and technology challenges in securing sustainable energy, protecting the environment, and reducing global warming – each of which not only have broad economic implications, but which also directly and indirectly impact human health. If you have not already done so, I would encourage you to review the positions of each of the Presidential candidates on the broad panoply of scientific challenges our nation faces. A review of some of their positions was presented in the September 25th issue of *Nature* (<http://www.nature.com/news/specials/uselection2008/index.html>). Obviously it is important to look at the positions that have been taken by these candidates during past years and not just those put forth during the throes of a political campaign. It should not escape notice that some of our nation's greatest scientific leaders, including 61 Nobel Laureates, have written a letter to American Citizens expressing their concerns and their recommendations (see: <http://sefora.org/wp-content/uploads/2008/09/nobelists-for-obama.pdf>). Of note, all three of the 2008 American Nobel Laureates have now joined this group of scientists.

Until the current dramatic economic downturns, health and healthcare were among the top issues on many voters' minds. Given the current expense of healthcare in the USA and the inadequacy of the system that supports it, it is critical that we not lose sight of addressing healthcare reform early in the next administration. Of course, this will be harder than ever because of the expenses that will be incurred – but not doing so will likely lead to further unraveling of medical care as well as the economy. Without wishing to sound too hyperbolic or overly simplistic, I would point out that we have already witnessed what happened when the finance and banking industries were unregulated and left to market forces for correction and resolution. Market based healthcare has been a mantra for many but seems unlikely to result in meaningful reform.

From my point of view, I don't think either of the Presidential contenders offers a truly innovative healthcare plan – but they do offer differences. There are two excellent sources you might turn to for additional information and insight. One is the latest issue of our own **Stanford Medicine** on *Politics and Health Reform*. You can access it at <http://stanmed.stanford.edu/2008fall/>. Secondly, a side-by-side comparison of the McCain and Obama healthcare proposals is presented in the October 9th issue of the **New England Journal of Medicine** (<http://content.nejm.org/cgi/content/full/359/15/1537> and <http://content.nejm.org/cgi/content/full/359/15/1537-a>). In addition to the narrative descriptions, there is also an excellent video on health care reform that discusses the strengths and differences in the healthcare proposals of Senators McCain and Obama which is also available at: <http://www.nejm.org/perspective/health-care-reform-video/>

Ironically, the current economic crisis may actually catalyze and accelerate more meaningful healthcare reform than might otherwise have occurred – but only if we have a President in the White House who is truly prepared and ready to move this agenda forward.

Hospitals' Designs Unveiled

On October 20th, the proposed designs for the replacement and expansion of Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) are being shared at a special event being held at the Garden Court Hotel in Palo Alto. These designs are part of the overall medical center master planning that includes both hospitals and the School of Medicine. This event follows the unanimous approval from the Stanford University Trustees on Tuesday October 14th to submit an application to the City of Palo Alto to rezone University land in the Medical Center to create a new hospital zone, along with the application to carry out the replacement and expansion plans.

You will recall that the Medical Center is divided between the City of Palo Alto and the County of Santa Clara. Both hospitals and some of the school's facilities in the original Grant, Alway, Lane and Edwards (GALE) buildings are located in Palo Alto. The rest of the school's research and administrative facilities, including the Li Ka Shing Center for Learning and Knowledge and the Lorry I. Lokey Stem Cell Research Building, both of which are now under construction, are in the County of Santa Clara. The Trustees' approval to apply for rezoning focuses on both hospitals and the School's GALE

Buildings, the latter of which will be replaced by the Foundations in Medicine (FIM) 1, 2 and 3 buildings.

Among the driving factors mandating the replacement and rebuilding of SHC is California Senate Bill 1953, which requires hospitals to retrofit or replace facilities that do not meet strict safety (and seismic) guidelines; it specifies deadlines in 2013, 2015 and 2030. According to SB 1953, the hospital beds located in the original 1959 complex cannot be used for patient care after 2030 – an important factor driving the hospital's plans for replacement and expansion. In addition, current hospital utilization, demographic projections and clinical programmatic planning have led to the conclusion that SHC will need an additional 144 hospital beds above the currently available 456 beds.

To accomplish this, SHC has pursued a design concept that addresses flexibility and a modular design for the delivery of complex and functional care that is patient and family-centered. To optimize flexibility, the hospital will employ a modular design supported by a technology platform that aggregates diagnostic, treatment and emergency services as well as mechanical infrastructures; it will occupy 1,100,000 gross square feet. The evolving design by world-renowned architect Raphael Vinoly presents a unique facility in which the patient care towers surround a central courtyard that is sloped with prominent water features designed to promote references to healing and nature.

From my perspective the design is excellent and will facilitate the concentration of patient services and supportive care (including ICUs) around thematic centers that will enhance state-of-the-art treatment, as well as promote and facilitate innovation and translational research. The contiguity of medical school faculty with the community and the patients they serve will further promote care that can be delivered with the highest quality and best service possible. It will also foster the teaching missions of the medical center for health professionals and for the community. While not complete, a current rendition of the SHC design follows:

The Lucile Packard Children's Hospital, built in 1991, is currently undergoing a number of renovations that will expand the number of ICU beds, operating rooms and other modifications and will result in 257 beds by the end of this year. The proposed further

expansion will result in an additional 104 beds, for a total of 361 beds. This further expansion will consist of new construction totaling 521,300 sq ft (it will, in fact, be larger than the existing hospital). The overarching goal is to create an integrated center of excellence that connects nature to a healing environment, harmonizes with existing buildings, and promotes a nurturing child and family experience that maximizes privacy while also enhancing a sense of community in a manner that is flexible, sustainable and supportive of LPCH's academic mission. The new LPCH addition will surround an inner courtyard garden that will feature an Explorer's Pavilion and will have single patient rooms, "tree houses" that provide alcoves for family respite and a warm color palette.

Of course, we all recognize that we are in the midst of a very challenging economic time and that all plans will require continuous reassessment. But given the time required to construct new hospitals and the lead-time required for approvals, entitlements, etc., it is imperative that the current approval process continue as planned. The cost of construction of the hospitals is significant and helping to ameliorate those costs through fundraising must be one of the highest priorities of our faculty. It will certainly be mine.

We also recognize that what will make Stanford unique in the 21st century is not just the beauty and excellence of our facilities but, even more importantly, the quality and skill of the work that is carried out in them. This means putting the care of patients first and creating a focused commitment to assuring that patient care is not only outstanding and innovative but that it is rendered with the highest quality and service in a truly patient-centric environment. That too must be among our highest priorities as we seek to shape Stanford Medicine in particular, and academic medicine more generally, for the decades ahead.

Board Approvals for Medical School Projects

On Monday October 13th, the Land & Buildings Committee of the Board of Trustees approved the next phase of construction of SIM1, the Lorry I. Lokey Stem Cell Research Building, which is currently under construction. The foundation is nearly complete and the steel structures will be rising from the ground in the next weeks. The official "groundbreaking" will take place on Monday October 27th at 3pm (see below). When the construction of SIM1 and the LKSC are completed in 2010, the new master plan for the medical school will be fully underway. As seen from Academic Walk, a new walkway

that will help unite the campus, the Lorry Lokey Stem Cell Research Building will provide a wonderful new addition to our evolving campus.

The Lorry I Lokey Stem Cell Research Building

The evolving master plan for the School of Medicine will feature architectural harmony among the current and future buildings along the axis that connects east to west to the Clark Center and the future Biology and Chemistry Buildings. To the south the medical school campus will connect to Engineering and the new Science and Engineering Quad (that will house the Bioengineering building). To the north, the new SSC and LPCH will create new facilities for patient care. This physical connectedness is one of the features that make Stanford Medicine unique and that help to facilitate the integration of interdisciplinary research, education and translational research that is becoming our trademark. A partial rendition of the master plan is shown below, highlighting not only east-west and north-south connections, but also the future construction of the Foundations in Medicine (FIMs 1-3) that will replace the GALE buildings (see below). Missing are SIM 2 and 3 that will be housed west of SIM1.

Campus Planning - School of Medicine

Master Plan- School of Medicine

We are also currently beginning architectural planning for Foundations in Medicine 1 (FIM1), which will be an 185,000-gasf (gross available square feet) building just north of CCSR. By way of reference SIM1, now under construction, is 200,000 gasf. The programs that will be housed in FIM1 are currently being developed, some of which will come from the Fairchild Science Building (which will be repurposed or replaced) and the Edwards Building (which will be demolished pending the entitlement approval from the City of Palo Alto). In designing FIM1 we are using many of the unique features that are currently being employed in SIM1. We have also made it a priority to blend FIM1 into the new architectural landscape that is defining the future of the medical school as well as the very prominent features of SHC that will be to the north. Some early renditions of FIM1 seen from across Pasteur Drive or from the Academic Walk follow:

From Pasteur Drive looking at FIM1 from SHC

From Academic Walk looking at FIM1 in relation to CCSR

While the planning of these buildings will continue, the timeline for the construction will almost surely be modified in light of the current economic situation. But those details will be further defined over the months ahead.

October 27th Groundbreaking Celebration for the Lorry I. Lokey Stem Cell Research Building

On Monday, October 27, we will celebrate the groundbreaking of the Lorry I. Lokey Stem Cell Research Building. Beginning at 1:00 pm. there will be a symposium in the Clark Center commemorating the 20th anniversary of the first isolation of an adult stem

cell—done here at Stanford by Irving Weissman, MD—and exploring the future of stem cell research. Following the symposium, at 3:00 pm, we will have a ceremony and reception at the building's construction site.

The Lokey Stem Cell Research Building will house the Stanford Stem Cell Biology and Regenerative Medicine Institute and will gather together scientists from multiple specialties and disciplines including cancer, neuroscience, cardiovascular medicine, transplantation, immunology, bioengineering, and developmental biology. The Stanford Cancer Center will have a major presence in the building, including researchers studying human cancer stem cells.

This facility will be one of the world's largest centers dedicated to stem cell research, and I look forward to the opportunity to celebrate with all those who have helped to make this project possible. Stem cell research and regenerative medicine are among the most exciting areas in medical science today, and I would like to once again express my heartfelt appreciation of the incredible generosity of Lorry Lokey for his naming gift. I also want to thank the California Institute for Regenerative Medicine for the extraordinary role it has played in fostering stem cell research in California. And of course I want to thank the other remarkable donors and supporters who have enabled Stanford to become a true leader in this most important field of science and medicine. For more information, or to RSVP to the symposium and/or groundbreaking ceremony, please contact Sandra Handy at 650.234.0618 or email sandra.handy@stanford.edu.

Update on Support for Graduate Students

In my April 21, 2008 newsletter (http://deansnewsletter.stanford.edu/archive/04_21_08.html#4), I announced additional sources of funding to address the NIH-imposed cap on graduate student tuition for students on NIH training grants. These sources include additional funding from the Provost from Stanford Graduate Fellowship (SGF) funds and School of Medicine financial aid endowment income. Sam Zelch, CFO and Assistant Dean, Fiscal Affairs, has set up procedures for accessing these new funds, and the Directors of Finance and Administration (DFA) in each department have the instructions and forms to complete. If there are any questions regarding how graduate programs can access these funds for their students, please contact the department DFA.

New eProtocol Biosafety System

I have been informed that the procedure for submitting research protocols requiring an Administrative Panel on Biosafety (APB) approval is changing in the Fall of 2008. Whereas in the past submission and review was done on paper, the new procedure will be accomplished entirely online, using the new eProtocol Biosafety system. This will also allow researchers to access their approved protocols on line and allow for improved communication with Biosafety program staffers.

eProtocol systems are already in place for Institutional Review Board (IRB), Administrative Panel on Laboratory Animal Care (APLAC) and Stem Cell Research Oversight (SCRO) submissions. While each system is separate at present, the university anticipates merging them in the future.

The new system is designed to streamline the review process, improve and centralize record creation and maintenance, provide automatic reminders, and reduce use of paper. It will allow PIs to check a protocol status at any time, as well as providing for immediate updating and convenient communications with documented histories.

Existing active protocols are presently being transferred into the new eProtocol system. When they first use the eProtocol system, PIs should check their protocols to ensure that they have been copied correctly.

A website is being constructed at <http://eprobio.stanford.edu> to support users of the system. The site should be available this Thursday, October 23. Downloadable documents on the site will help guide new users through the eProtocol Biosafety workflow. Specific procedures for submitting new protocols, communicating with panelists, and accessing all online information will also be available at the above URL.

In-person presentations to faculty and staff on the new system will be available on Thursday October 23 from 10:00 am to 12:00 noon, and Thursday, October 30 from 2:00 pm to 4:00 pm. Those who would like to attend either session should contact rbarron@stanford.edu to reserve a space.

For further information on eProtocol Biosafety, check the eprobio website, or contact Robyn Barron at 724-0798.

Patient Confidentiality and HIPPA: A Reminder

As you know, respect for our patients' privacy and compliance with HIPAA regulations as well as state law requires that, as physicians and health professionals, we remember and comply with the rule of "minimum necessary access" to medical records. This means that none of us are allowed or authorized to review patient records unless there is a clinical reason to do so, or where you have specific consent or other allowable legal reason for doing so. Accessing patient records - including those of your family members, friends, and others – for personal reasons is prohibited. While you might think that being a physician provides an entrée to review the medical records of colleagues, friends and family, even when you think this permits you to be helpful to them, this is forbidden by HIPPA and can result in serious consequences. I am aware of situations where this practice has not been followed and, based on guidance I have received from our Office of the General Counsel, I need to inform you that violations of this rule can result in very serious consequences – even termination. These regulations apply to all physicians, including trainees, and thus it is imperative that we each recognize these patient protections and that we all model an appropriate standard of practice and respect for patient privacy and confidentiality.

Bike Safety on Campus – Again

The opening of the school year brings thousands of new students to Stanford who energize the campus with excitement. But it also brings new challenges – not the least of which is personal and public safety. While Stanford students can be praised for their athletic as well as intellectual prowess, these skills do not always converge when it comes to bike safety. Despite many warnings and even the increased scrutiny by the Stanford Police, I remain shocked and disappointed by the neglect of personal safety for the bike riders themselves and others who are affected by their sometimes-reckless behavior. I am shocked by how few students wear helmets or have any lights or reflective devices on the bikes at night – including cyclists on the medical school campus! As I drive home each night I am always struck by the numerous close calls and near misses I observe with cyclists who are barely visible, dashing across streets along campus drive, assuming they have a right of way or that, because they can see on-coming traffic, they too can be seen by motor vehicles. I, as well as others, have called for greater enforcement of bike safety on campus for many years, and while I know there has been an effort to improve safety, it seems clear that we still have a long way to go. It will be a tragedy when another student, faculty or staff member is seriously injured or even killed because of a cycling accident, especially since such an injury might be prevented by better attention to simple safety rules. We all need to do better in enforcing bike safety and calling on our community to be more responsible in preventing unnecessary injury and harm.

Remembering Sabine Kohler

Dr. Steve Galli, The Mary Hewitt Loveless, M.D. Professor and Chair of the Department of Pathology informed our medical center community that Dr. Sabine Kohler, Professor of Pathology, died on October 9th following an eight-year battle with cancer. Dr. Kohler was an enormously courageous individual who, despite her illness, continued to mentor and teach residents and students, carry out research, publish papers, give lectures around the world, dedicate herself to family and friends and serve as a role model of inner strength, intelligence and personal humanity. She will be deeply missed by everyone who had the good fortune to know, admire, and love her. Our deepest condolences go to her family, colleagues and friends.

Arrangements are being made for a "celebration of life" which will take place in the near future. Details will be posted on her website, <http://www.caringbridge.org/visit/sabinekohler>)

Another Reminder of When Doctors Became Marketers

I have written all too frequently about some unfortunate connections between medicine and industry – particularly when doctors take on the role of marketing drugs or devices to the public. Although it is easy to forget now, one of the more egregious transgressions arose from the 1920s through the early 1950s when tobacco manufacturers engaged doctors to market cigarettes and tobacco products. While smoking has declined

considerably in the USA and in many parts of Europe, it is on the rise in Asia. The negative impact of tobacco on human health stands as one of the great tragedies of avarice and greed (themes resonating today in the financial industry), and, while we might be quick to point the finger at the tobacco industry, physicians played a role in giving credibility to smoking. This sad chapter has been thoughtfully detailed by Dr. Rob Jackler, Edward C. and Amy H. Sewall Professor in Otorhinolaryngology and Chair of Otolaryngology-Head & Neck Surgery. The exhibit that he and his colleagues prepared on this topic is now being shown at the New York Library and has received wide acclaim (see:

http://www.nytimes.com/2008/10/07/business/media/07adco.html?_r=1&scp=1&sq=new%20york%20public%20library%20tobacco%20exhibit&st=cse&oref=slogin) You can

also review the exhibit through the Lane Library (see:

<http://lane.stanford.edu/tobacco/index.html>). We owe Dr. Jackler our thanks and respect for bringing this sad but important history of how human health can be adversely impacted when doctors market products – some of which may prove to be dangerous. Unfortunately, it is not only a reminder of our past but also warning of some of the all-too-recent infractions by members of the medical profession who violate our pledge, as physicians, “to do no harm.”

Doing More to Engage Our Alumni

Doug Stewart, Associate Vice President, Medical Development and Alumni Affairs, has updated me on two recent events that illustrate the School’s efforts to better engage our alumni in meaningful ways.

On Thursday, September 25, the School of Medicine Career Center hosted a successful Open House and Wine Reception to celebrate its new location in the Grant building and to foster greater student-alumni interaction. More than 50 alumni and 125 School of Medicine students and trainees attended to network, socialize and learn about the office’s resources. The event was sponsored by the Stanford University Medical Center Alumni Association and Boston Consulting Group, and featured two guest speakers, Thomas Fogarty, MD, and Benjamin Berk, MD '07.

On Friday, October 10, our alumni association presented three “Classes Without Quizzes” in conjunction with Stanford University’s Homecoming Reunion Weekend. More than 150 medical and other Stanford alumni gathered to hear sessions on innovations and research milestones presented by Professors Carla Shatz, Russ Altman and Bill Newsome. All three sessions were “standing room only” and received the highest ratings in a follow-up survey.

Thanks to all who made these events so successful, and I look forward to more such occasions in the future.

Awards and Honors

- **Dr. Irv Weissman**, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research *and Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine* has won the 2009 Rosensteel Award from Brandeis University. This award was established in 1972 to honor individuals who have made pioneering contributions to science. Congratulations to Dr. Weissman on another important honor for his groundbreaking work in stem cell biology.
- **Dr. Sam Gambhir**, *Professor of Radiology and Bioengineering and Director of the Molecular Imaging Program at Stanford*, is one of 65 newly elected members of the Institute of Medicine of the National Academy of Sciences. Established in 1970, the IOM is recognized as a national resource for independent, scientifically informed analysis and recommendations on issues impacting human health. In the IOM press release announcing Dr. Gambhir's new membership, it was noted that "election to the IOM is considered one of the highest honors in the fields of health and medicine and recognizes individuals who have demonstrated outstanding professional achievement and commitment to service". That description fits Sam Gambhir quite well. Please join me in congratulating him.
- **Dr. Jennifer Cochran**, *Assistant Professor of Bioengineering*, has been named one of 15 young investigators to receive a V Foundation for Cancer Research 2008 Awards. The V Scholar grants are designed to identify, retain and further the careers of young investigators. Dr. Cochran's proposal is entitled: Engineering a new class of tumor-targeting peptides for cancer biology, imaging and therapy. Please join me in congratulating Dr. Cochran.
- **Dr. Glenn Chertow** has been appointed the first incumbent of the Norman S. Coplon/Satellite Healthcare Professorship in Medicine. We had the privilege of honoring Dr. Chertow for his many important accomplishments and for thanking Dr. Coplon and the Satellite Healthcare that he founded at a reception on October 6th at the Arrillaga Alumni Center.

Upcoming Events

Stanford Health Policy Forum: "How War is Changing Medicine"

Wednesday, October 29th

11:00 am – 12:00 pm

Clark Center Auditorium

Space is limited, so if you are interested in attending please RSVP to:

Lucy.Wicks@Stanford.edu.

Appointments and Promotions

- **Eswar Krishnan** has been appointed to Assistant Professor of Medicine (Immunology and Rheumatology), effective 10/01/08.

- **John B. Sunwoo** has been appointed to Assistant Professor of Otolaryngology – Head and Neck Surgery, effective 10/01/08.
- **Atul Butte** has been reappointed to Assistant Professor of Medicine (Medical Informatics) and of Pediatrics, effective 11/01/08.

Dean's Newsletter

November 3, 2008

The Economy, the University and the School of Medicine: Planning for the Future

In the October 6th issue of the *Dean's Newsletter* I wrote a piece entitled “Preparing for the Future” (see: http://deansnewsletter.stanford.edu/archive/10_06_08.html#1) and offered a perspective on how the rapidly changing economic climate might impact the financial underpinnings of academic medicine generally and Stanford Medicine in particular. I commented on the major sources of support for our key missions in education, research and patient care and reminded you that even in times of plenty, education and research are “cost centers” (i.e., tuition and grants do not fully cover their costs) and that they require institutional support to fully fund them. At Stanford School of Medicine we currently do this with our unrestricted reserves, income from endowment or patent royalties, gifts, and surplus from patient care income. However, these funds are limited and are also affected by changes in the national or local economy.

While we share some common features with the economic profile of the University, the School of Medicine has some distinct differences. In local parlance, we are a “formula school” (as is the Graduate School of Business), which means that we construct and execute a separate budget process and are responsible for funding all of our programmatic and capital projects. The School of Medicine is different from the “non-formula schools” of Engineering, Humanities & Sciences, Earth Science, Law and Education, which receive “operating budget support” from the Provost to support their programs. As I described in the October 6th Newsletter, support for our faculty, students, staff, programs and capital projects comes from tuition, sponsored grants from the federal government (largely NIH), the state (largely CIRM), foundations (perhaps most notably HHMI), income from endowment, accrued reserves, gifts, patent royalties and payments for patient care delivered by our faculty through “funds flow” agreements with Stanford Hospital & Clinics (SHC) and Lucile Packard Children's Hospital (LPCH).

As I forecast in my October 6th Newsletter, significant changes in each of these funding sources seem inevitable; taken together, they could have a major impact on our programs. The magnitude of the changes in the global economy, as each of you knows all too well, has been startling, and these dramatic changes, as well as the likely onset of a recession, have serious implications on the forecasts we made in constructing our FY09 budget just months ago. Fortunately, we were prudent and fiscally conservative in many of the assumptions that went into our budget plan and financial planning. But even our

conservative fiscal forecast is challenged by the economic changes rocking our national and global community.

Regardless of who wins the White House on November 4th, the enormous deficits coupled with the incredible investments being made to bale out Wall Street and relieve the frozen credit market have huge implications for future discretionary federal spending. Almost certainly this will impact the budget for NIH, NSF and other federal research programs, as well as the entitlement programs like Medicare and Medicaid, which play important roles in patient care and graduate medical education payments to teaching hospitals and academic medical centers. And just as you have noted significant losses in your personal investments and 401ks over the past weeks, our University (and related School of Medicine) endowment income has also suffered significant losses that will impact those sources of funding for years to come (and we recognize that we don't even know what further deterioration might occur in the days and months ahead). Since payouts of the income from endowment are subject to a "smoothing formula," we must anticipate these changes (which will be worse than the forecasts made this summer) as part of a multi-year process.

Just as the University endowment investments have lost considerable value, so have those of all private and family foundations – whose losses are proportional to the types and risks of their individual investment portfolios. That means that many of the non-profit foundations that have funded research projects, investigators or even capital projects in the past will also be reassessing what they can afford to do in the year(s) ahead. And as individuals and industries have suffered mounting financial losses we can expect that the size and frequency of gifts will also be delayed and negatively impacted.

At the same time, we still project increased income from our patient care activities based on volume projects, hospital contracts, funds flow and clinical performance. But it should be anticipated that these projections are also subject to change as individuals reduce their personal health care expenditures, especially for discretionary care. As noted, there may well be changes in federal funding through Medicare (especially for GME) and state entitlement programs like MediCal. These changes will almost surely have important implications for SHC and LPCH – and, thus for the School of Medicine as well. Of course, it must also be expected that the economic meltdown will further collide with rising health care costs in what will almost certainly prove to be an unsustainable formula. Perhaps a silver lining of these convergences will be more serious efforts to radically reform health care in the USA – although how this occurs will also have important implications for academic medicine, which, by definition, is more costly than other models of health care delivery.

Clearly there are many uncertainties, and it is likely that these will continue and even escalate over the coming months and year(s). Thus it is important for each of us to be engaged in the reassessment, recalibration and re-prioritization of our individual and programmatic goals so that we can secure and optimize the success of our community and our missions. As I reflected in the October 6th Newsletter, this is a process we have

already begun; it will continue to unfold as we better understand the full impact of the economic world in which we will be living in the years ahead.

It is within this context that the President and Provost have shared their views with the University and that the Provost engaged in a Q&A in the October 29th issue of the *Stanford Report* (see <http://news-service.stanford.edu/news/2008/october29/provost-102908.html>). As noted above, because we are a “formula school,” the School of Medicine will adopt different fiscal remedies than those described by President Hennessy and Provost Etchemendy in an email they sent to the Stanford community on October 30th. At the same time, their general advice is extremely important, and I think that portions of their commentary bear repeating:

“We are confident that we can make strategic adjustments, so that we do not harm the momentum we have built up in recent years, especially our investment in the quality of our faculty. The strength of the university is the excellence of its people, and we will strive to protect this excellence. To protect as many jobs as possible, we intend to have a quite modest salary program for the next few years. And we will honor the substantial commitments we made to financial aid for both undergraduate and graduate students, preserving opportunity for the best and brightest to attend Stanford.

We will act decisively, but not foolishly. We are in the midst of a major capital program that includes some vital construction projects. Halting projects in mid-construction, even temporarily, would cost us more money in the long run. But not all our projects will be built on the schedule we had originally hoped. We will reexamine the need for projects that would require us to incur significant amounts of debt, and likely postpone such projects.

We ask the campus community to apply the same mindset to all of our resources: What is the cost versus benefit? Are there things we can do in a less costly way? Can we be more purposeful? After a period of rapid growth, it can be healthy for an institution to pause and examine its strategic priorities.

Finally, we must stay true to our core values and goals as we make any financial decisions. Excellence is at the heart of Stanford, and undermining quality would be shortsighted. Stanford has achieved leadership positions across the academic spectrum, and through our ongoing campaign is poised to become a leader in important new areas. We remain committed to excellence in research and teaching, and to the search for solutions to the world’s greatest challenges. Our goals will remain ambitious, and our contributions to society will continue to be substantial.”

From my perspective it is imperative that we continue to think boldly as well as prudently. We have been initiating our Strategic Plan, *Translating Discoveries*, since 2002, and much work remains to fully implement our ideas and our investments in people, programs and facilities. As I have previously commented, times of fiscal constraint require greater vision and leadership – from each of us. They also require

improved collaboration, cooperation and communication. Having lived and led through different periods of economic downturn (although none likely as bad as the one we are now facing), I often use the analogy of operating a sailing ship that has entered very stormy (and worsening) waters. Without question we need to pay attention to staying afloat, and that likely means bailing water to stay as light as we can, taking down the sails and altering our speed to avoid fighting winds and gales. And while that might keep our boat afloat it is not sufficient. At the same time we need to use our compass to stay focused on our direction so that when the storm abates we will be going in the right direction and able to pick up speed quickly and successfully to reach our destination. Planning for the moment and anticipating the future are equally critical – and together we can do both successfully. What will this mean on a practical basis?

- ***Overall planning:*** I think we have a great vision for the future, and we must not lose sight of it despite the challenges we now face. As a “formula” school projected decreases in endowment income may not translate into the types of reductions in the operating formula budgets noted by the President and Provost for the non-formula schools and other areas of the University, since our budgets and resources are constructed differently. Nevertheless, we may need to shift priorities in different areas, delay programs or recruitments, reduce investments and adjust expectations as well as timelines. That said, I continue to believe that the course we have been on during the past nearly seven years is the correct one for Stanford Medicine and that we need to work diligently to keeping moving forward. Although running a marathon uses a different skill set, as an experienced marathoner, I also know that mid-course corrections are frequently necessary depending on the conditions one is facing and that they do not preempt one from getting to the finish line. That analogy holds true for Stanford Medicine – but we will clearly need to sustain and enhance our vigilance, adaptability, flexibility and focus.
- ***People:*** Without question, what makes Stanford a great institution is the excellence of our faculty, students and staff. One of our highest priorities must be sustaining them and thus doing all we can to retain all who share our commitment to excellence in education, research and patient care. But it is also people who constitute the largest portion of any budget and thus we need to be particularly sensitive to our human resources during this period of restraint. This will require scrutinizing all vacant positions and in some cases delaying, postponing or even canceling new appointments. This will also likely mean slowing down faculty recruitments in selected areas – unless a financial or programmatic need mandates otherwise. That said, we recognize that recruitment of new faculty is essential to our future vibrancy and success – but that the timelines for some of these recruitments will need to be delayed. I do not envision any impact on medical or graduate student numbers, but we will all need to be more vigilant on postdoctoral fellow appointments – especially if clearly defined funding sources are not already in hand or forthcoming when a postdoc appointment is being made.

As you also know, we operate under a faculty billet cap – which we have been carefully monitoring. We anticipate that fewer faculty and staff will feel financially ready to retire in the foreseeable future. It seems clear that as individual faculty take into account their personal losses in pensions and savings, some who may have planned to retire may modify, adjust or delay their plans. If so, this will have individual as well as institutional implications.

- **Programs:** The Stanford University Medical Center, comprised as it is of the School of Medicine, SHC and LPCH, is a complicated weave of many different and sometimes overlapping programs – supported by various entities including departments, institutes, centers, the dean’s office and the hospitals. The financial sources for program support are also highly diversified and come from public and private dollars as well as a multiplicity of reserve accounts of varying amounts. Because oversight over these resources is decentralized, decisions about spending rates will need to be made by individual faculty as well as various institutional leaders. That said, we will encourage prudence and caution, especially since the major impact of reductions in endowment and reserve balances will not be truly felt for two or more years.

At this point I am not anticipating the discontinuation of any major program or initiative. However, we will need to be increasingly critical of how our investments are being deployed and this may, in time, result in recommendations to cut back or discontinue selected programs. It will also necessitate a high bar for initiating new programs, although I anticipate that some are forthcoming, including an incipient effort in global health that we have been planning for some time.

We also need to reserve some of the funding we have used for new recruits or programs for bridge funds at the department and institutional level. We need to anticipate that federal funding for research will remain challenging and that faculty will periodically face serious funding shortfalls that might benefit from short-term interventions.

Even before the current fiscal crisis we were planning ways to diversify the support for our research programs – an issue I have addressed in prior Newsletters. Progress in gathering ideas and recommendations about how to accomplish this was achieved at a mini-retreat on Saturday, October 25th, led by Marcia Cohen, Senior Associate Dean for Finance and Administration, Harry Greenberg, Senior Associate Dean for Research, and David O’Brien, Director of the Office of Institutional Planning. Some 24 basic and clinical science faculty reviewed the funding trends of the medical school and made a number of recommendations about how we can become more successful at a time of restraint. Those ideas are being collated and will be shared with our Executive Committee – and then with you. I am also eager to hear thoughts and recommendations from you as well.

A very important programmatic effort that we must enhance is faculty and career development. While we have made some progress it is clear that we have much to do in this important area. This will be the major theme for our 2009 Leadership Retreat. Our efforts in supporting career development will almost certainly impact our success as an institution – especially during the challenging era that we are now entering.

- **Personal Support:** We are fortunate in having financial resources to support our medical and graduate students and, while those resources will be more strained, I do not currently envision that we will witness reductions in the support for education – either in tuition aid or in other programs we currently have in place. Nor do we envision imminent changes in support for housing or other benefit programs. We are extremely aware of the toll that the current fiscal crisis is having on each of you as individuals and on your families, and we will do our best to preserve our commitments. We have not made decisions about how faculty and staff salaries will be adjusted in future years, but we do anticipate that there will continue to be merit pay programs as well as adjustments for promotion, etc.
- **Facilities:** Obviously we have a number of major facilities projects underway, including the completion of the Connectivity Project (aka the new loading dock and tunnel system), the Li Ka Shing Center for Learning and Knowledge (LKSC) and the Lorry I Lokey Stem Cell Research Building (SIM1). Thankfully, we have the resources for these projects and fully expect them to be completed on time. We are also initiating architectural planning for the Foundations in Medicine-1 building (FIM1) and the Freidenrich Center for Translational Medicine. However, the timeline for construction of these and future facilities that are part of our master plan (as I presented in the October 20th Dean's Newsletter: <http://deansnewsletter.stanford.edu/#3>) will be contingent on our revised financial forecasts and on the balance between needs for program support and those for capital requirements. That said, there seems no question that our timelines will require reconsideration and revision. As I also mentioned in the last Newsletter, we also need to give a high priority to the fulfillment of the hospital's renewal plans (see: <http://deansnewsletter.stanford.edu/#2>).
- **Philanthropy:** Of course we need to be realistic about our fundraising expectations. We have been extremely successful in recent years, but we all recognize that the current fiscal climate will almost certainly have a negative impact on private and foundation donations. That said, it is important that we continue to share our vision with current or potential donors and that we search for new sources of funding that may be less affected by current events. This will clearly require effort and time – but it too is a very high priority. On the programmatic side, my highest priorities for the medical school are to achieve greater programmatic support for the Stanford Cancer Center, for our programs in neurosciences, for graduate students and for our research programs. And, as mentioned, we will work diligently to support the efforts of our hospitals. This is

not an exhaustive list but I do want to offer some priorities. Naturally we will support other good ideas or opportunities as they arise.

This is a partial assessment that is meant to provide some guidance about how I am thinking about the currently unfolding events and how they will impact our community. I do very much want to continue to offer a message of optimism and excitement about our future – but to do so in a way that is cognizant of realities. We will continue to think and plan boldly and then modify our plans as resources permit. Of course, as much as we can we will endeavor to modify the forces acting on us so that we can be as successful as possible – as an institution, a community and beyond.

East and West Experiments in Medical Education

On Monday, October 20th I had the opportunity to present the keynote address at an international conference on medical education in Beijing, China. In my presentation, I delineated some of the overarching values and goals that I believe should guide the future of medical education. These include a solid grounding in science and the continuing integration of science with clinical medicine throughout undergraduate and graduate medical education continuum. Also needed is a focus on professionalism, compassion and ethics as well as an emphasis on preserving health in addition to diagnosing and treating disease. An emphasis on lifetime learning is also essential given the rate at which current knowledge becomes obsolete. Educating students and all learners with technologies and techniques that engage them and that foster ways of improving outcomes is increasingly important. Also critical is an ever-increasing awareness of cultural diversity and global health and environment issues, which can also affect individual and societal expressions of disease, unfortunately including the forces of economic disruption, war, violence and even torture. Within this general context, I reviewed the evolution of medical education in the USA, highlighting the early impact of the Flexner Report in 1910 and the evolution of programs that have supported research (predominantly the NIH) as well as federal entitlement programs like Medicare and Medicaid. These programs had a major impact on shaping the development of academic medical centers in the USA.

Since a number of countries in Europe and Asia are seeking to develop academic medical centers similar to those in the USA, I reviewed the organization and governance of these centers, how they are impacted by being publicly or privately funded, and how the sources of support and funding they achieve affects their missions in education, research and education. I pointed out that there is a large array of academic medical centers and underscored the fact that there is no model that is easily generalized – and that nearly all are influenced by their history, community, university affiliations, location, culture and related factors. These influence the goals and objectives of medical schools and medical centers in their specific focus in the education and training of doctors. For example, medical schools and medical centers may vary in their emphasis on primary vs specialized care, or on the degree of their focus on those who aim for careers as physician-scientists or other pathways related to medicine, healthcare, science and policy. I underscored that medical schools should not aim to be similar one to another, but should

individualize to develop unique programs and areas of emphasis and expertise. To foster this variance, nations should support schools that develop different missions and that ideally complement each other in their expertise and excellence.

Because the course of medical education varies widely around the world, I reviewed the scope and spectrum of training in the USA, beginning with college and then extending through undergraduate and graduate medical education to the various career pathways in clinical medicine, academics, business and beyond. I discussed the impact of the duration of training and its costs on career choice as well as the ways that the current generation of students is selecting their personal career pathways. In doing so, I pointed out how the lack of an organized healthcare system in the USA is impacting education, training and career choice. For example, the comparative lack of primary care physicians compared to other nations is one manifestation of this deficiency, as is the relative mal-distribution of doctors. Currently there are approximately 800,000 physicians in the USA for a population just over 300 million – but a number of the population remains underserved because of economic factors and the imbalance of generalists versus specialists, among many other factors. I also pointed out that the current directive from the AAMC (Association of American Medical Colleges) to increase medical school classes by 30% appears misguided (at least to me), since it fails to present ways to correct the present imbalances of specialties and their distribution and also fails to incorporate other health care providers (especially nurses) into the health work force. It was interesting to learn that similar patterns also exist in other nations and that efforts to balance the workforce are being more rationally designed and developed by some countries than by the USA.

I was specifically asked to discuss the model of medical education at Stanford; I did so within the broad context of our programs but with the caveats about what is unique to our environment. I underscored that it would be difficult to easily replicate our model in other settings. I also discussed how the current economic forces could impact on the missions of a research-intensive medical school like Stanford, referencing some of the challenges I discussed above. I was impressed by the differences as well as the similarities in medical education taking place in Europe and Asia. While each of the programs faced different challenges, it is clear that we have much that we can learn from each other.

Launching Connections: A Program for Junior Faculty Career Development

I am pleased to announce that as part of building increased support, networking and mentoring for new junior faculty the Office of Academic Affairs is launching a pilot program called ***Connections: Fostering Junior Faculty Careers and Community at Stanford School of Medicine***. This program, developed in partnership with the Office of Diversity and Leadership, builds on the successful experiences we have witnessed with the Faculty Fellows Program initiated by Dr. Hannah Valentine and her colleagues. In announcing the pilot ***Connections*** program I want to thank Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, along with Dr. Lucy Tompkins, Associate Dean, and Rebecca Robinson, Academic Affairs Manager, for putting this new program together.

As currently envisioned, all Assistant Professors and Clinical Assistant Professors hired in 2008 will be invited to participate in the 2009 **Connections** program. The goal of the program will be to permit junior faculty members to meet and network with colleagues across departments and disciplines to:

- Learn more concretely how the School of Medicine functions
- Obtain useful career development information
- Learn about resources available to them at the School and the University
- Have a helpful forum for raising questions and topics and receiving information and guidance

In a manner analogous to the Faculty Fellows Program, the **Connections** program will consist of small cross-departmental group meetings to share and discuss experiences related to career development. Likely discussion topics include expectations for establishing successful mentor/mentee relationships; balancing clinical and scholarship activities; integrating into professional and personal communities; hiring postdoctoral fellows when you have not attracted your ideal applicant pool; grant writing and review; and how others address family/work life challenges so that individual and group learning experiences can be exchanged.

Each of the groups will be led by more senior faculty leaders who will share their expertise, experience, and perspective with their junior faculty colleagues. Importantly, these experiences will be enriched by the shared experiences of the participating faculty. To help guide junior faculty about “who’s who” and “how things are done” at Stanford, presentations on the criteria for academic promotion, compensation, networking and related issues will be presented for information and discussion.

It is hoped that the new **Connections** program will enable junior faculty to better navigate their career development at Stanford and will allow them to feel more a part of this vibrant and exciting community. For questions please contact Associate Dean Lucy Tompkins (lucytomp@stanford.edu), or Rebecca Robinson, Academic Affairs Manager, at rrobinso@stanford.edu.

Implementing Transitions: Dr. Gary Schoolnik

In the August 25th issue of the Dean’s Newsletter I gave an update on the work of the Transitions Task Force for senior faculty (see: http://deansnewsletter.stanford.edu/archive/08_25_08.html#4). A number of important recommendations were put forth but their implementation will require focused leadership. I am very pleased to announce that Dr. Gary Schoolnik, Professor of Medicine and of Microbiology and Immunology, has agreed to take on the role of Associate Dean for Senior Faculty Transitions on a part-time basis starting January 1, 2009.

As highlighted above, Dr. Schoolnik has served as chair of the Task Force on Senior Faculty Transitions. Under his leadership, the Task Force identified, considered and made

recommendations to address issues associated with various types of transitions experienced by our senior faculty. These included faculty who transition from active to emeritus status, those who step down from a period of administrative service to a more focused faculty role, faculty who move from a phase of intense research activity to one of lesser intensity, or faculty who transition from more full-time clinical work to either reduced clinical loads or other activities. Dr. Schoolnik will be responsible for translating the recommendations of the Task Force into actions that will help transitions occur smoothly, ideally with anticipatory planning and with dignity.

Dr. Schoolnik is an incredible faculty member and I am truly pleased that he will commit some of his time to this important role.

What CIRM Has Meant for California

On Monday, October 27th we had the wonderful opportunity to celebrate the official groundbreaking of the Lorry I Lokey Stem Cell Research Building. This is the first of our Stanford Institutes of Medicine buildings (see: <http://deansnewsletter.stanford.edu/#3>) and represents a special public-private partnership. Thanks to Lorry Lokey's naming gift of \$75 million, along with wonderful gifts from other exceptionally committed members of our community, the funding for the \$200 million project cost for SIM1 has been achieved. An important component of this support comes from the California Institute for Regenerative Medicine (CIRM), which, based on a highly competitive process, awarded Stanford a construction grant of \$43.6 million. In fact, the impact of CIRM on the research and construction economy of California has been notable.

A recent, and still quite preliminary, analysis of the impact of CIRM funding state-wide reveals that, to date, 229 grants have been committed to 27 institutions, with a total amount of funding of over \$614 million. To date, \$285.1 million of these expenditures have been committed to facilities and equipment and \$329 million to research and training grants. Of these, Stanford has received 32 grants (13.9% of the total awarded) and \$93.8 million (15.2% of the total funding). The impact of CIRM across California is significant. At least 45 senior researchers, along with numerous young investigators and scholars, have been recruited to California since Proposition 71 was passed in November 2004. It is estimated that matching funds average over 226% of those provided by CIRM for major facilities, shared laboratories and core. This has been facilitated by significant philanthropic contributions totaling over \$900 million to various organizations and institutions in California that have received CIRM funding – a testament to a significant and important leveraging effect. Equally important is a burgeoning of biotechnology companies in stem cell biology in California as well as a number of international collaborations. At a time when stem cell research supported by the federal government has been stifled by political agendas, California has assumed an important leadership role – which is important for the state, the nation and the world.

We are clearly in the early days of stem cell research, but we are also witnessing important progress. While it is likely that a change in the Administration in the White House will signal a change in regulations regarding stem cell research, the deficits in the

federal budget make it unlikely that a significant national stem cell research agenda will be launched. This makes the work going on in California all the more important. It also means that the Lorry I Lokey Stem Cell Research Building at Stanford will be one of the epicenters for stem cell research for many years to come. While this is gratifying it also underscores the importance of using our resources well and wisely so that the maximum impact on advancing knowledge and translating findings into human clinical trials is achieved as quickly and as well as is possible.

Stanford Health Policy Begins with a Discussion of War and Medicine

On Wednesday, October 29th, the first Stanford Policy Forum was held, thanks to the leadership of Dr. Keith Humphrey, Professor of Psychiatry and Behavioral Sciences, and Ryan Adesnik, Director of Federal Relations. The topic was “*How War is Changing Medicine*,” and it featured presentations by Drs. Ken Kizer, former Under Secretary for Health in the US Department of Veteran’s Affairs; Dr. Craig Rosen, Assistant Professor of Psychiatry and Behavioral Sciences and Acting Deputy Director, Dissemination and Training Division of the National Center for PTSD; and Dr. Eugene Carragee, Professor and Vice Chair of the Department of Orthopaedic Surgery.

The Policy Forum was noteworthy for reviewing the various facts about war and medicine and their intersection over time. But it was particularly meaningful for the human portrait offered by Gene Carragee, who based his presentation on his personal experiences as Commander of US Army Surgical Teams in Iraq, Afghanistan and numerous other war zones. He pointed out that the nature of war injuries has changed dramatically in the recent conflicts in Iraq and Afghanistan, in part because of the nature of the inflicted injuries (more explosive devices than bullets), the availability of body armor that leaves some parts of the body protected and others not, and the profound psychological impact facing soldiers and citizens. Accordingly, the major injuries are now disabling back pain, musculoskeletal disorders and psychological trauma. While not traditional combat injuries *per se*, these traumas take a true human toll, with acute and chronic challenges to individuals, families and societies. Something more to consider on Election Day tomorrow.

COI Features Prominently at the Annual Meeting of the AAMC

Issues and concerns regarding conflict of interest loomed high at the October 31-November 4th national meeting of the AAMC (Association for American Medical Colleges). The major focus was on academic-industry relations – a topic that was explored in numerous sessions. In fact, I participated in two panels on this topic – one for students and a second one that was a major focus session. In addition, Dr. Harry Greenberg, Senior Associate Dean for Research, also participated in a panel on COI for chief medical officers. It was clear from the presentations and discussions that the landscape regarding institutional policies and restrictions on industry funding in association with education, patient care activities and research (especially those involving human subjects) is changing rapidly. Earlier this year the AAMC announced recommendations regarding industry relations which it hopes all medical schools will be

compliant within the next year. Thankfully, Stanford is widely regarded as a leader in this area and our policies are viewed as among the most informed and important. This is a dynamically changing area and it is important that policies be applied prospectively and not retrospectively. Having discussed this topic with you on a number of occasions, I hope you are familiar with the Stanford Policies and Guidelines. If you need a refresher, please consult (<http://med.stanford.edu/coi/>).

University and Biodesign Collaborate on Bike Safety

In the October 20th issue of the Dean's Newsletter (see: <http://deansnewsletter.stanford.edu/#8>) I commented on my continuing concerns over bike safety on campus. While this remains a concern I am pleased to note how seriously members of our community are taking it. Most notably, the Biodesign Program and the Parking & Transportation group have joined forces with the Stanford Entrepreneurship Network for the 2008 Invention Challenge – which will be focused on bike safety (see <http://bikechallenge.stanford.edu/>). In this challenge students will be asked to “invent a device, method, process or technique that will have a positive effect on the prevention or mitigation of bicycle injury. This is great news.

In addition, I am informed by Ariadne Delon Scott, the Bicycle Program Coordinator at Stanford, that another education safety program was held this past week – this one at the Clark Center. Over 200 individuals visited the event, 82% of whom took – and passed – the bike safety quiz, for which they received a free bike bell. Bike helmets were sold at the event and bikes were registered and riders informed about basic principles of safety. I am extremely appreciative to all who participate in these programs and to those who are working diligently to foster a greater sense of safety for bikers and for the Stanford community.

Nominations Sought for 2009 Dean's Medal

You may recall that last spring, as part of the School's Centennial Celebration, we initiated a new School of Medicine tradition by making an annual award of the Dean's Medal one of the highest honors bestowed by the School. The Medal is an expression of recognition and appreciation by the School of Medicine community for individuals whose life work has resulted in outstanding contributions to one or more of our missions in education, research and patient care. The 2008 recipients of Dean's Medal were John and Jill Freidenrich, Stanford alumni and longtime supporters of the medical school, and Paul Berg, PhD, the Vivian K. Cahill Professor of Cancer Research, emeritus (see <http://med.stanford.edu/mcr/2008/dean-medal-0402.html> for the full story).

I now invite you to submit nominations for the 2009 Dean's Medals. Recipients may be educators, research scientists or scholars, healthcare practitioners, humanitarians, philanthropists or civic leaders. Among the qualifications we will be seeking are:

- Stanford alumni whose achievements and service have brought honor and distinction to their alma mater;

- Senior or emeritus faculty members whose work has greatly contributed to the advancement of their field and/or the School of Medicine;
- Educators, scientific or healthcare leaders, or advocates whose record of leadership has substantively advanced the causes of health, medicine, and knowledge;
- Volunteers and/or philanthropists whose sustained support and leadership has substantively advanced the School of Medicine and/or other community or global causes related to health, medicine and science.

Each year we will honor up to three Dean's Medal recipients. Please submit your nomination and a brief explanation of why you believe your nominee merits a Dean's Medal to Mira Engel, Executive Assistant to the Dean, at mengel@stanford.edu by December 1. Please note that elected officials are not eligible for the Dean's Medal while in office.

Awards and Honors

- **Dr. Tom Krummel**, Emile Holman Professor and Chair of the Department of Surgery and Susan B. Ford Surgeon-in-Chief at LPCH, has been elected Vice President and President Elect of the Halsted Society. Congratulations to Dr. Krummel
- The School of Medicine and the Office of Diversity and Leadership are pleased to announce the recipients of the 2008 McCormick Faculty Awards. The McCormick Funds were established to provide research/project funding to junior faculty women pursuing advancement, or to junior faculty men or women who support the advancement of women in medicine and/or medical research. This year 32 applications were submitted and the three award winners are:
 - **Dr. Kari Christine Nadeau, Assistant Professor of Pediatrics (Allergy & Clinical Immunology)**. Her project is entitled *"The Role of Diesel Exhaust Particles in the Modulation of the Immune System in the Development of Atopy"*
 - **Dr. Iris Schrijver, Assistant Professor of Pathology (Pediatrics)**. Her project is: *"Identification and characterization of CFTR mutations among African Americans with cystic fibrosis to improve the clinical sensitivity of neonatal screening and diagnostic testing"*.
 - **Dr. Jane Tan, Assistant Professor of Medicine (Nephrology)** for her project entitled *"Sensitization to Y chromosome encoded minor histocompatibility antigens H-Y affects clinical outcomes in kidney transplantation and is manifested by newly detectable antibodies"*.
- The Gates Foundation announced 104 winners of its most recent Grand Challenges Awards in Global Health (see: <http://www.gcgh.org/explorations/Pages/GrantsAwarded.aspx>) which included three Stanford proposals:
 - **Christina Smolke**, Assistant Professor of Bioengineering: *Genetically-Encoded Technologies that Support the Design of Molecular Sensing-Regulatory Systems for Targeted Disease Treatment Strategies*

- **Andy Fire**, Professor of Pathology and of Genetics: *Identification of Small RNA Molecules Capable of Eliciting Cellular Immunity During RNA Virus Infection*
- **Mark Davis**, Burt and Marion Avery Family Professor: *Multiplex Tetramer Analysis of Vaccine Responses*
- **Dr. Lisa Chamberlain**, Assistant Professor of Pediatrics at LPCH, has been selected to receive the Physician Advocacy Merit Award from the Institute on Medicine as a Profession (IMAP). She will attend the IMAP Award Ceremony at their annual meeting in New York and present the specifics of her work.
- **Dr. David Stevenson**, Vice Dean and Senior Assoc Dean for Academic Affairs, the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, will be the recipient of the Joseph W. St. Geme, Jr. Education Award for 2009. The award is conferred biannually by the Western Society for Pediatric Research in recognition of outstanding achievement in pediatric education.
- **Dr. Geoffrey D. Rubin**, Professor of Radiology, has been selected to present the annual Charles T. Dotter Memorial Lecture at the 2008 Scientific Sessions of the American Heart Association on Nov 11 in New Orleans. His presentation, "More Surprises from the Healthy Donut," explores the evolving role of computed tomography in the diagnosis and management of cardiovascular diseases.
- **Dr. Keith Humphreys**, Professor of Psychiatry and Behavioral Sciences, has won the American Psychological Association award for Distinguished Contributions to Psychology in the Public Interest. Dr. Humphreys was honored for his work on expanding mental health services for U.S. veterans as well as for his work in Iraq on restoring that nation's health care system.

Congratulations to all who have been honored and have received awards.

Appointments and Promotions

Christina Anderson has been reappointed to Clinical Assistant Professor (Affiliated) of Pediatrics (Neonatology), effective 09/01/2008.

Katherine A. Blenko has been reappointed to Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 09/01/2008.

Sarah Eitzman has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Ambulatory Pediatrics), effective 09/01/2008.

Julieta Gabiola has been reappointed to Clinical Assistant Professor of Medicine (General Internal Medicine), effective 09/01/2008.

Norman Gross has been reappointed to Clinical Assistant Professor (Affiliated) of Medicine (Hematology), effective 09/01/2008.

Kimberly S. Harney has been reappointed to Clinical Assistant Professor of Obstetrics and Gynecology, effective 11/01/2008.

Rona Hu has been appointed to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 11/01/2008.

John Jernick has been reappointed to Clinical Associate Professor of Medicine (Family and Community Medicine), effective 11/01/2008.

Ronald Jimenez has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Ambulatory Pediatrics), effective 09/01/2008.

Carolyn Cruz Kerr has been reappointed to Clinical Instructor (Affiliated) of Obstetrics and Gynecology, effective 10/10/2008.

Joseph Kim has been promoted to Clinical Assistant Professor of Pediatrics (General Pediatrics), effective 11/01/2008.

Robert Lieberman has been appointed to Clinical Assistant Professor of Neurosurgery, effective 11/01/2008.

Michael G. Lyon has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 09/01/2008.

Daryl A. Oaks has been promoted to Clinical Assistant Professor of Anesthesia (Cardiac Anesthesia), effective 11/01/2008.

John McKeller has been reappointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 11/01/2008.

Phuong Nguyen has been reappointed to Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 09/01/2008.

Lynn Peng has been appointed to Clinical Assistant Professor of Pediatrics (Cardiology), effective 12/15/2008.

Roger Spencer has been reappointed to Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 09/01/2008.

Jennifer Tong has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 10/01/2008.

Roland Torres has been promoted to Clinical Associate Professor of Neurosurgery, effective 12/01/2008.

Edward S. Yee has been appointed to Clinical Assistant Professor of Cardiothoracic Surgery, effective 06/01/2008.

Dean's Newsletter

November 17, 2008

The Transition

This is not a political statement. But it is an affirmation of hope. Despite the seemingly never-ending onslaught of dismal economic and related news, the national elections on November 4th injected a sense of hopefulness, perhaps especially given the harsh realities we face as a nation, a community – and individually. The prospect of moving forward with a national agenda that respects and values science, innovation and technology; that seeks input from thought-leaders across the many domains impacting our global communities; and that gives voice to new citizens and leaders who were silenced for all too many years speaks to a deep spirit of justice, dormant for too long, that has been reborn and that everyone can be proud to be part of regardless of their “politics” – and that everyone can celebrate. Of course, these moments of pride and ebullience will surely – and soon - give rise to the shattering realities that are affecting all of us – but they also make clear that there is much we can overcome when we stay focused and aligned. In recent Newsletters I have addressed how these issues are impacting our university and medical center (see: <http://deansnewsletter.stanford.edu/#1> and http://deansnewsletter.stanford.edu/archive/10_06_08.html#1). And while those issues remain as true today as when I wrote these articles – or even more so, it is hard not to be more hopeful in light of recent events.

Although of much lower significance, I have been quite taken aback by how many people have mentioned to me that they assumed that I might be leaving for Washington. While none of us can predict the future, I do want to say that I have made it very clear to anyone who has asked that I am totally committed to the work we have begun together at Stanford and have every intention of continuing to do all I can to serve you and our community in the years ahead.

The NIH and Economic Stimulus

In recent issues of the Dean's Newsletter I have highlighted the impact of the current economic downturn on the university and on academic medical centers (see: <http://deansnewsletter.stanford.edu/#1> and http://deansnewsletter.stanford.edu/archive/10_06_08.html#1). Among the issues most important to our future success is funding from the National Institutes of Health – which, as you well know, has been flat for five years and which now has 20% less purchasing power than it did in 2003. The future of the NIH will be an important issue for the new Administration, and we are all aware that President-Elect Obama forecast a doubling of the NIH budget over 10 years if he were elected president. Of course we also recognize that all such promises will be assessed in light of the major economic downturn. And we

also believe that sustainable and predictable funding is most important – ideally keeping pace with inflation or above.

So it is highly important to question how the NIH might fare in the new Administration and under the new economic realities. We had considerable discussion about this on November 12th at the Board of Directors meeting of the Foundation for the NIH (of which I am a member); we underscored that the best argument for increasing the support for the NIH is its importance as part of a stimulus package. Indeed, this argument was made to a hearing before the House Energy and Commerce Subcommittee on Health on November 13th. One of the important arguments is that NIH funding supports approximately 300,000 jobs in the USA (approximately seven per grant) and stimulates a number of other industries – especially the pharmaceutical and biotechnology industries. Thus, a very cogent case can be made for increasing funding of the NIH as part of an economic stimulus package – something that the Obama team will address as a way of stimulating economic recovery. Indeed, this argument applies to science and technology writ large, as discussed in a Special Report in the November 13th issue of *Nature* entitled “Science in the Meltdown” (see: <http://www.nature.com/news/2008/081112/full/456155a.html>). Since we are all involved in advocacy efforts to sustain and improve funding for science, medicine and technology, these arguments are particularly germane and important to share with your colleagues and professional organizations.

Celebrating Our Colleagues

The dedication and commitment of our outstanding staff colleagues who form the backbone of Stanford Medicine are among our greatest assets. While our students and faculty receive most of the acclaim for the work that they carry out, none of their efforts would be possible without the remarkable staff who support their missions in education, research and patient care – and who provide the intellect and human resources that support and enrich our broad and deep infrastructures in finance and administration. What is equally remarkable is the loyalty of our outstanding staff and how much they enjoy and appreciate being part of the Stanford community. It is that satisfaction that allows many to continue to work with us for decades – and that creates a community of true excellence. Each year we take a few moments to thank our School of Medicine colleagues who have been members of our staff for five or more years. On Thursday, November 6th we celebrated their contributions at our Staff Recognition Banquet. This event is an opportunity to say thank you to each of these valued employees. It is also a wonderful time for me to meet personally those who play such an important role in the life of the school and university.

In addition to thanking the 343 individuals who have worked for 5 or more years (which is 19.7% of our overall staff), I was also pleased to honor the three individuals who were named by their peers and colleagues the 2008 recipients of the SPIRIT Award (<http://news-service.stanford.edu/news/2008/november12/med-spirit-111208.html>). These three outstanding employees are:

- ***Libuse Jerabek***, Lab Manager, Stanford Institute for Stem Cell Biology and Regenerative Medicine (who was also acknowledged for her many years of service to Stanford)
- ***Kendra Baldwin***, Leadership Search Coordinator, Office of Institutional Planning
- ***Gretchen Shawver***, Clerkship Coordinator, Department of Pediatrics (who was joined at the banquet by her 5 month old baby)

Please join me in congratulating each of these truly outstanding employees

I am also very pleased to list below those individuals who have served for 20 or more years – which, as you will note, includes one individual who has been part of the Stanford Medicine community for four decades. Again, please join me in offering thanks and appreciation to each of these individuals.

40 Years of Service

Libuse Jerabek

Institute for Stem Cell Biology & Regenerative Medicine

35 Years of Service

Again, thanks to each of these individuals, for those who have achieved the 5, 10 and 15-year marks and for those who are still in the early phase of their Stanford journey.

Provost's Survey on Faculty Quality of Life Survey

On Friday, November 7, you should have received an email message from Provost John Etchemendy requesting your participation in the second university-wide Stanford Faculty Quality of Life Survey. This follows the first Stanford Faculty Quality of Life Survey, which was conducted in 2003 by the Provost's Advisory Committee on the Status of Women Faculty and which provided important observations (see: <http://facultydevelopment.stanford.edu/reports>).

If you have already completed the November 7th survey, thank you very much. If you haven't done so as yet, I strongly encourage you to do so. Hopefully, the results will help us to both understand the experiences and perspectives of our faculty and make Stanford an even better place to pursue their academic careers. If you have problems finding the message from Provost Etchemendy or opening or completing the survey, please contact Jill Crowley at jcrowley@stanford.edu. Again, thank you very much.

Gender and Satisfaction in Academic Medicine

In the January 28, 2008 issue of the Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/01_28_08.html#2) I summarized some of the results of a pilot study in which Stanford participated regarding faculty job satisfaction. This project has been sponsored by the Association of American Medical Colleges (AAMC) in partnership with the Collaborative on Academic Careers in Higher Education (COACHE). Ten institutions participated in the survey, which was conducted in the summer of 2007. We have had some discussions about the results of the survey, and we recently revisited the topic at the November 7th Executive Committee in anticipation of a school-wide survey about how our faculty assess their career development at Stanford. These data will serve as a foundation for the 2009 Leadership Retreat, which will focus on this topic and on how we might enhance our efforts in this area.

Because the numbers of Stanford respondents in the 2007 COACHE survey were relatively small (296 of 775) definitive conclusions were not forthcoming. However, we did note a number of areas where Stanford Medical School faculty were more satisfied with their careers than faculty at the two peer institutions to which we were compared. We also noted some gender related trends suggesting that women were, overall, less satisfied than men with the support they felt for both enhancing their career development and maintaining a balance of work and family life.

These observations have been affirmed on a larger scale in data recently presented by the AAMC (*"Differences in US Medical School Faculty Job Satisfaction by Gender"* AAMC Analysis in Brief, Volume 8 (Number 7), November 2008) that assessed responses of 3208 faculty from ten medical schools on questions identical to those posed to Stanford faculty. While 65% of men and women were satisfied with being part of an academic medical faculty, significantly fewer women than men found their workplace to be supportive to their career development. Sadly, these data are also consistent with the discussions that Dr. Hannah Valentine, Senior Associate Dean for Diversity and Leadership, and I have had with junior women faculty during the past months, and they underscore the fact that we need to do even more to make our workplace as supportive as possible. Career development is one of our most important issues, and, as noted above, it will be the focus of our upcoming Leadership Retreat. It remains my hope (and expectation) that we can develop new and better ways of enhancing the career development of all of our faculty – and of women in particular. More on this to follow.

Update from the Department of Radiation Oncology

Dr. Richard Hoppe, the Henry S. Kaplan-Harry Lebeson Professor and Chair of the Department of Radiation Oncology, gave an update about his department to the Executive Committee on Friday November 7th. He prepared the following summary of his remarks for the Newsletter:

"The Department of Radiation Oncology includes three Divisions: Radiation Therapy, Radiation Physics, and Radiation and Cancer Biology. The research and education programs of the three Divisions overlap extensively. In addition, the Radiation Therapy and Radiation Physics Divisions are heavily committed to patient care.

Patient care services are provided at SHC in the Stanford Cancer Center and Blake Wilbur Building. Patients from the Lucille Packard Children's Hospital and Palo Alto Veteran's Administration Hospital are treated at SHC. In addition, clinical services are provided at the Emanuel Hospital, in Turlock, California, as part of a joint venture between SHC and Emanuel, the "Stanford-Emanuel Radiation Oncology Center". An outreach radiation physics service provides those services to several community hospitals in northern California.

The Department provides comprehensive and expert radiation therapy services. The faculty includes national experts in the broad range of cancer diagnoses. The faculty work closely with other specialists in the Departments of Cardiothoracic Surgery, Dermatology, Medicine, Neurology, Neurosurgery, Obstetrics and Gynecology, Ophthalmology, Orthopaedics, Otolaryngology-Head&Neck Surgery, Pathology, Pediatrics, Radiology, Surgery, and Urology to provide the highest level of interdisciplinary care available anywhere in the world. Key items of equipment include six multi-purpose linear accelerators with on-line portal imaging, two Cyberknife linear accelerators, a PET-CT simulator, a CT simulator, two conventional simulators, a high dose afterloading brachytherapy unit, and numerous accessories. High technology services available to patients include 3-D conformal radiation therapy, intensity

modulated radiotherapy (IMRT), 4-D radiation therapy with respiratory gating, image-guided radiotherapy (IGRT), radiosurgery, and both high-dose rate and low-dose rate brachytherapy. The number of patients treated annually has increased at a steady pace, increasing from ~1450 to ~2950 patients between FY 2000 and FY 2008. In 2003, the Radiation Therapy staff was awarded the Malinda S. Mitchell Quality Award from SHC for service excellence.

The Department supports a diverse portfolio of research programs. The major themes in the Radiation and Cancer Biology program include investigation of the role of hypoxia on tumor growth and response to therapy, the development of pharmacologic and biologic agents to combine with chemotherapy and radiation therapy to improve local control and reduce metastatic spread, and the identification of genetic determinants that influence tumor response to irradiation or chemotherapy. Major themes for the Radiation Physics program include the use of molecular imaging to assist in radiation therapy treatment planning and assessment of response to therapy, the development of criteria for defining "biologically conformal" radiation therapy, defining techniques of 4-D intensity modulated radiotherapy, development of small animal conformal radiation therapy, and refinement of techniques for image-guided radiotherapy. Research in the Radiation Therapy program includes clinical trials (both institutional and co-operative group), late effects studies, the development of novel techniques of irradiation, image-guided radiotherapy, stereotactic radiosurgery (both cranial and body), radiation immunosuppression, radioimmunotherapy, and identification of prognostic/predictive factors. The Department has maintained excellent funding for its research program, with total research dollars increasing from ~\$4.7 million in FY 2001 to just over \$9 million in the most recent academic year. More than \$7.5 million of that is federal sponsored research.

The Department has educational programs at all levels. It supports 11 graduate and 29 post-doctoral students. It has one of a very few residency programs nationally in radiation physics, which can lead to certification by the American Board of Radiology. The four-year residency program in radiation oncology is among the most popular in the nation, and was recently awarded a full five years of accreditation by the ACGME. It receives 125-150 applications the three spots available in the program each year. Sixteen of the last 25 graduates of the program have entered into an academic career following their graduation.

Radiation oncology is a high technology field. The new horizon of research and treatment is related to proton therapy. Protons have intrinsic advantages over photons (x-rays) or electrons for cancer therapy, but the expense of proton therapy utilizing existing technology is extraordinary. The Department is exploring a relationship with SLAC to develop new concepts in proton therapy that may help it to maintain its reputation as a world-class department."

Kick-Off Meeting for Green Teams

As announced in the August 25, 2008 Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/08_25_08.html), the School has a new initiative around sustainability, which is guided by our Sustainability Steering Committee. The Committee has planned a kickoff meeting for Green Teams, which will

encourage a grass-roots effort to engage faculty, staff and students at all levels throughout the School to make sustainability a part of their everyday life and decision-making. The meeting is being held in the Clark Auditorium on Wednesday, December 3rd at 2 pm, and will include information, resources, and support for those who want to help the School of Medicine start changing our culture to one in which sustainability is deeply valued and acted upon daily. Every department should send at least one representative, and I encourage anyone interested in sustainability to go and make a commitment to start your own Green Team. Questions can go to Julia Tussing, Chair of the Sustainability Steering Committee, at tussing1@stanford.edu.

Appointments and Promotions

- **Amin M. Al-Ahmad** has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 11/01/08.
- **Raffi S. Avedian** has been appointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 11/01/08.
- **Valerie L. Baker** has been appointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 11/01/08.
- **John Barry** has been promoted to Professor of Psychiatry and Behavioral Sciences and, by courtesy, of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 11/01/08.
- **Howard Chang** has been promoted to Associate Professor of Dermatology, effective 11/01/08.
- **Jason L. Dragoo** has been reappointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 11/01/08.
- **Michael Federle** has been appointed to Professor of Radiology at the Stanford University Medical Center, effective 11/01/08.
- **David F. Fiorentino** has been reappointed to Assistant Professor of Dermatology and, by courtesy, of Medicine, at the Stanford University Medical Center, effective 11/01/08.
- **Tracy George** has been reappointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 11/01/08.
- **Sabine Girod** has been promoted to Associate Professor of Surgery and, by courtesy, of Otolaryngology – Head and Neck Surgery, at the Stanford University Medical Center, effective 11/01/08.
- **Alice E. Guardino** has been reappointed to Assistant Professor of Medicine (Oncology) at the Stanford University Medical Center, effective 11/01/08.
- **Norman Lacayo** has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/01/08.
- **Ginna LaPort** has been promoted to Associate Professor of Medicine (Blood and Marrow Transplantation) at the Stanford University Medical Center, effective 11/01/08.
- **John P.W.M. Lavelle** has been appointed to Associate Professor of Urology at the Veterans Affairs Palo Alto Health Care System, effective 11/01/08.

- **John T. Leppert** has been appointed to Assistant Professor of Urology at the Veterans Affairs Palo Alto Health Care System, effective 11/01/08.
- **Teri Longacre** has been promoted to Professor of Pathology at the Stanford University Medical Center, effective 11/01/08.
- **Tracey L. McLaughlin** has been reappointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 11/01/08.
- **Claudia M. Mueller**, has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 11/01/08.
- **Manu Prakash** has been appointed to Assistant Professor of Bioengineering, effective 11/01/08.
- **Pilar Ruiz-Lozano** has been appointed to Associate Professor (Research) of Pediatrics, effective 11/01/08.
- **Marc R. Safran** has been appointed to Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 11/01/08.
- **Iris Schrijver** has been promoted to Associate Professor of Pathology and, by courtesy, of Pediatrics, at the Stanford University Medical Center, effective 11/01/08.
- **Joseph B. Shrager** has been appointed to Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 11/01/08.
- **Eric R. Sokol** has been reappointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 11/01/08.
- **Robert West**, has been reappointed to Assistant Professor of Pathology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 11/01/08.
- **Jeffrey Yao** has been reappointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 11/01/08.

Dean's Newsletter

December 1, 2008

On Professionalism and Patient-Centricity

We are all too aware of the multiplicity of factors and forces that have eroded the public trust in medicine as a profession: the fact that many patients lack a personal connection with their primary healthcare provider; the lack of time that most physicians have to spend with their patients; the imbalance between primary care physicians and specialists; the mismatch between the location of physicians and many who need their care; the highly technological environment that, while it defines modern healthcare, is not often accompanied by the personal touch and connection of doctors and their patients; the market forces that have both driven medicine to become more of a business than a profession and contributed to the rising costs of healthcare; and the huge, and growing, number of citizens who lack insurance as well as the fact that the USA is not seen as a world leader in health outcomes – at least on a population basis. These and other changes are not new, but they have converged in a fashion, and at a time, that lead many to the

conclusion that medicine has lost its anchor of professionalism. And, sadly, there is truth to this assertion.

While it is true that many individuals profess confidence in their own doctor, most are dissatisfied with the healthcare system as we know it today in the USA. And surveys continue to demonstrate that most physicians who practice medicine are increasingly dissatisfied with their own careers in medicine. A problem, however, is that while the vast majority of Americans believe that significant change in healthcare is needed, there is no unifying consensus about what those changes should be. And while a focus on healthcare reform was a clarion call during the past two years of the presidential primaries, it has given way to the dramatically deteriorating global economic meltdown that has so dominated our lives during the past months. While some say that the financial crisis will make healthcare reform a lesser immediate priority, there are others who believe that the importance of healthcare reform is critical to our ultimate economic recovery and thus should be a priority. I hope the latter is true.

Regardless of the pace of healthcare reform, we can exercise leadership in regaining the public trust in our daily work at Stanford. For our clinical care systems this means establishing a much more focused patient-centric environment. We do not really have that now. Many patients enter our hospitals not really knowing who is providing or coordinating their care. Our highly specialized services do not communicate as proactively as they should in the coordination of a patient's evaluation and treatment. And patient-friendly services, at nearly every level, could benefit from attention and improvement. It is all too easy to assume that these challenges are someone else's responsibility. The reality is that they are the responsibility of each of us – and it is only when we each own our own responsibility that we can make progress.

Put simply, a major goal for our clinical programs and leaders is to make Stanford Medicine as excellent as possible in the delivery of patient-centric care. This does not mean abandoning our great strengths in innovation and discovery – but it does mean implementing them, along with excellent clinical care, in a setting that focuses much more on the experience of patients as individuals – and of their families. To use a cliché, it means delivering care in the manner in which we would like a member of our own family to receive it. Accomplishing this will require some fundamental restructuring in the way we carry out our daily activities. But I would argue that this is not an option if Stanford Medicine is to remain successful.

The rapid consolidation of health care systems currently underway in the Bay Area prompts us to think critically about what differentiates Stanford Medicine and makes it a value-added health care provider in our community. There is no question that our contributions to creating knowledge and our ability to translate discoveries into new diagnostic or treatment regimens are key components of what defines Stanford Medicine. But these cannot be our only defining features. When patients (as consumers) or potential referring physicians have a choice, they will consider not only whether the care we offer is unique but also whether it is delivered with compassion, sensitivity and professionalism.

With that in mind, I was gratified that the leaders of the Stanford Medical Student Association (SMSA) made a presentation to the November 19th Medical School Faculty Senate on “Professionalism in the MD Curriculum: The Student Perspective.” Of particular importance was the willingness of SMSA to take ownership and responsibility for fostering professionalism among their fellow students and to seek guidance and support about how professionalism can be fostered at all levels of training and in all interactions. SMSA, led by its President, Tiffany Castillo (SMSIII), had a range of recommendations from issues like attire, timeliness and communications to fostering mechanisms by which feedback about student professionalism would be made available in real time discussions with faculty and supervisors. The SMSA volunteered to take responsibility for overseeing student violations of professionalism, but they also proposed an open dialogue about how we can strengthen a culture of “professionalism” at Stanford. This student-led initiative is enormously welcome, albeit a bit ironic. Indeed, while we should have as a primary focus teaching our students about professionalism, it is also clear that we have much to learn from them as well.

I would add that promoting a culture that fosters professionalism and a patient-centric focus requires the active participation of all of us – faculty, residents, fellows, students, nurses, administrators and all health providers and professionals. This is not an option. I do want to acknowledge the students who have joined with Tiffany Castillo in this effort – including: Sarah Pickard, SMSII, Jon Kleinman, SMSII, James Torchia, SMSIII, Aabed Meer, SMSIII, Mariko Howe, SMSIII, Christine Chang, SMSII, and Malavika Prahbu, SMSII.

I end by noting that the School of Medicine has a Statement on Professionalism in its MD Handbook that is adapted from similar statements promulgated by the American Boards of Internal Medicine and of Pediatrics. Students are expected to meet the standards set forth in this Statement in order to qualify for the conferral of the MD degree from the Stanford University School of Medicine. In reviewing the Statement (which I copy below) it would seem that meeting these standards should be an expectation for all of us at Stanford.

School of Medicine Statement on Professionalism

Professionalism comprises those attributes and behaviors that serve to maintain patient interests above physician self-interest. Professionalism extends beyond interactions with patients and their families, however. Professionalism also involves relationships and interactions between all those involved in medical education and the delivery of patient care including physicians, students, administrators, and allied health professionals. It has implications for research activities and interactions with for-profit companies, governmental agencies, and other outside entities. Professionalism should pervade all of our activities in medicine and should include:

- ***A commitment to the highest standards of excellence in the practice of medicine and in the generation and dissemination of knowledge.***
- ***A commitment to sustain the interests and welfare of patients.***

- *A commitment to be responsive to the health needs of society.*

The elements of professionalism include altruism, accountability, responsibility, excellence, duty, honesty, integrity, and respect for others. Physicians, students of medicine, and all staff participating in medical student education and patient care at Stanford University School of Medicine are expected to aspire to these ideals, further defined as:

- ***Altruism** is the unselfish regard for and devotion to the welfare of others and is a key element of professionalism. Self-interest or the interests of other parties should not interfere with the care of one's patients and their families.*
- ***Accountability and responsibility** are required at many levels – individual patients, society and the profession. First, there must be accountability to one's patients and to their families. There must also be accountability to society for addressing the health needs of the public and to ensure that the public's needs are addressed. One must also be accountable to the profession to ensure that the ethical precepts of practice are upheld. Inherent in responsibility is reliability in completing assigned duties or fulfilling commitments. There must also be a willingness to accept responsibility for errors.*
- ***Excellence** entails a conscientious effort to exceed ordinary expectations and to make a commitment to life-long learning. Commitment to excellence is an acknowledged goal for all physicians and students of medicine. A key to excellence is the pursuit of and commitment to providing the highest quality of health care through lifelong learning, education, and reflection. One must seek to learn from errors and aspire to excellence through self-evaluation and acceptance of the critiques of others.*
- ***Duty** is the free acceptance of a commitment to service. This commitment entails being available and responsive when "on call," accepting inconvenience to meet the needs of one's patients, enduring unavoidable risks to oneself when a patient's welfare is at stake, advocating the best possible care regardless of ability to pay, seeking active roles in professional organizations, and volunteering one's skills and expertise for the welfare of the community.*
- ***Honesty and integrity** are the consistent regard for the highest standards of behavior and the refusal to violate one's personal and professional codes. Honesty and integrity imply being fair, being truthful, keeping one's word, meeting commitments, and being forthright in interactions with patients, peers, and in all professional work, whether through documentation, personal communication, presentations, research, or other aspects of interaction. They require awareness of situations that may result in conflict of interest or that result in personal gain at the expense of the best interest of the patient.*
- ***Respect for others** is the essence of humanism, and humanism is central to professionalism. This respect extends to all spheres of contact, including but not limited to patients, families, other physicians, and professional colleagues, including nurses, residents, fellows, and medical students. One must treat all persons with respect and regard for their individual worth and dignity. One must listen attentively and respond humanely to the concerns of patients and family*

members. Appropriate empathy for and relief of pain, discomfort, and anxiety should be part of the daily practice of medicine. One must be fair and nondiscriminatory and be aware of emotional, personal, family, and cultural influences on patient well-being and patients' rights and choices of medical care. It is also a professional obligation to respect appropriate patient confidentiality.

Medical Students and Leadership

Over the past several years a number of leadership training programs have developed throughout the School of Medicine and Medical Center. For example, the Office of Leadership and Diversity, led by Dr. Hannah Valantine, has initiated a number of programs for faculty, including the Faculty Fellows Program, the Physician-Faculty Leadership Program (done jointly with LPCH), Skills Building Workshops and the Women's Faculty Network, among others. Both SHC and LPCH have also instituted important leadership development programs; taken together, they offer a number of opportunities for our faculty to acquire new skills and to explore new career pathways.

We also seek to promote leadership development for our students through courses and programs that foster their personal and professional growth and success. Thus, I was particularly pleased to note that two of our students (Tiffany Castillo, SMS III and Matt Goldstein, SMS IV, the current and past presidents of the Stanford Medical Student Association [SMSA]) have collaborated with UCSF Surgery Resident Dr. Bernard Palmer, who is pursuing a Master's in Education at Stanford focused on leadership training, to develop a student-led course on leadership. They and 12 fellow-students participated in weekly presentations and discussions by invited leaders throughout the Medical Center, who shared their personal journeys and lessons learned about leadership. They focused on topics such as defining leadership, how to provide influence, the value of teams, communication and emotional intelligence, diversity, and conflict management, among others. From this they distilled some very different styles of leadership as well as some common themes – including the importance of vision, a passion for change, the ability to learn from mistakes and the value of approaching one's career with integrity and honesty – as guideposts for leadership.

There is often a debate as to whether leaders are born or whether they can be educated for the roles they assume. Like most issues, it seems evident that certain personality characteristics and experiences are more successful than others for the rigors of leadership. But it is also clear that effective leaders do learn – from their experiences, from others, and from mentorship – about the best approaches to leadership. It is likely that effective leaders are suited for some roles but not others. For example, the measures of success in medicine or academic life are likely different from those in business or government. But there are no absolutes, and one domain and discipline can inform others.

What is also clear is that our students are eager to become leaders and that they are finding ways of acquiring the skills to become more successful and effective. This is quite exciting and gratifying, and it gives us all hope for the future.

Transitions in Graduate Medical Education

A critically important bridge between undergraduate medical education and the assumption of a career as a junior faculty member or practicing physician or scientist is the interlude known as graduate medical education, postdoctoral and/or fellowship training. If the time to attain an MD or PhD degree approximates 4-5 years, the time in post-degree training can range from 3 to more than 10 additional years. For MD graduates, this is the period of differentiation and the time when the course of a career as a physician or physician-scientists/scholar is defined.

The continuity and coordination between undergraduate medical education and graduate/postgraduate training is often limited – which is one of the reasons I created the Office of Graduate Medical Education and Continuing Medical Education, which has been led by Dr. Myriam Curet, Professor of Surgery. Dr. Curet developed a number of integrating programs during the past three years, and I am grateful to her for those achievements. However, she has recently informed me that she has decided to take an administrative leave to pursue special interests in surgical education and training. Please join me in thanking Dr. Curet for her wonderful contributions to education – in surgery, for medical students and residents, and nationally in a number of professional organizations. She is a highly respected medical educator, and I appreciate all that she has done for Stanford and beyond – we look forward to welcoming her back in the not too distant future.

Given these changes, I have decided to reorganize the functions of Dr. Curet's office to provide even greater continuity between undergraduate and graduate medical education. Accordingly, Dr. Charles Prober, current Senior Associate Dean for Medical Student Education, will assume oversight over graduate medical education programs. In doing so he will work closely with Dr. Larry Shuer, Professor of Neurosurgery and Associate Dean for Graduate Medical Education. He will also be working with clinical department chairs, program directors and others to foster opportunities for career development of Residents and Clinical Fellows. These will be modeled on the themes of our Scholarly Concentrations and will take the form of networking programs for residents interested in a wide range of career options. These new opportunities will also bring together residents and clinical fellows from various medical, pediatric, diagnostic and surgical specialties who share common interests in medicine, science, health policy, etc.

As you also know, we are undergoing a number of changes in Continuing Medical Education (CME), which is now being led by Dr. Rob Jackler, Edward C. and Amy H. Sewall Professor and Chair of Otolaryngology/Head & Neck Surgery and Associate Dean for CME. During these transitions, Dr. Jackler's team will report to me and will work closely with Dr. Harry Greenberg, Senior Associate Dean for Research, and Dr. Kathy Gillam, Senior Advisor to the Dean.

Environmental Venture Project Funding Opportunity

The Wood Institute for the Environment invites all Stanford faculty to submit letters of intent for the 2009 Woods Environmental Venture Projects (EVP) grant program. EVP grants provide seed funding for interdisciplinary research projects that lead to practical solutions promoting an environmentally sustainable world. The EVP research committee will consider projects with budgets up to \$100,000 per year for up to two years. Proposals from all disciplines are encouraged, and the Lead PI must be a member of the Academic Council. Letters can be submitted online by January 9, 2009, at <http://woods.stanford.edu/research/evp.html>. Please contact Paula Wetzel at pwetzel@stanford.edu with any questions.

Awards and Honors

- **Dr. Irv Weissman**, Virginia & D.K. Ludwig Professor in Pathology and in Developmental Biology and Director of the Stanford Center for Stem Cell Biology and Regenerative Medicine, has been named the 2008 recipient of the Robert Koch Award. The Koch Foundation awards an annual prize for leadership in the biomedical sciences, especially in microbiology and immunology. This year the Foundation's Scientific Advisory Board recommended that the awards be focused on stem cell research – noting that they were doing so in a political climate that had taken stands on this research. In doing so the committee noted, “Research must remain free and therefore has to be protected from non-scientific influences such as ‘Creationism,’ ‘Fundamentalism,’ ‘Intelligent Design,’ or other non-scientific ideas or religious convictions.” The Foundation's specific comments about Dr. Weissman not only praised his fundamental scientific discoveries but also highlighted “his very substantial personal commitment to improving the political environment with regard to stem cell research.” Please join me in congratulating Dr. Weissman for another prestigious award for his scientific prowess and his role as an ambassador for the integrity of science and discovery.
- **Dr. Michael McConnell**, Associate Professor in the department of Medicine (Cardiovascular Medicine) received a Fulbright Scholar Award to study “Real-time Magnetic Resonance Imaging- Guided High Intensity Focused Ultrasound of the Heart”. Congratulations to Mike McConnell.
- The Stanford University Postdoctoral Association (SUPA) has announced the two winners of the inaugural ***Stanford Postdoctoral Mentoring Award***. The two winners are:
 - *Professor Andrea Goldsmith* (Electrical Engineering)
 - *Professor James Gross* (Psychology)In addition to congratulating the two winners I also want to thank the SUPA for creating this important award, which underscores and honors faculty who have contributed to the successful mentoring of postdoctoral fellows.

Appointments and Promotions

- **Jayanta Bhattacharya** has been promoted to Associate Professor of Medicine (Primary Care and Outcomes Research), effective 11/01/08.
- **Rebecca Fahrig** has been promoted to Associate Professor (Research) of Radiology, effective 11/01/08.
- **Jeremy Goldhaber-Fiebert** has been appointed to Assistant Professor of Medicine (Primary Care and Outcomes Research), effective 11/01/08.
- **Grant N. Miller** has been reappointed to Assistant Professor of Medicine (Primary Care and Outcomes Research), effective 12/01/08.
- **Nihar R. Nayak** has been reappointed to Assistant Professor of Obstetrics and Gynecology, effective 10/01/08.
- **Gary M. Shaw** has been appointed to Professor (Research) of Pediatrics , effective 11/01/08.
- **Alejandro Sweet-Cordero** has been reappointed to Assistant Professor of Pediatrics, effective 12/01/08.
- **Lu Tian** has been appointed to Assistant Professor of Health Research and Policy, effective 11/01/08.
- **David C. Yeomans** has been promoted to Associate Professor of Anesthesia, effective 11/01/08.

Dean's Newsletter December 15, 2008

Taking Stock: The Traditional Ending and New Beginning

This is often the time of the year when we take stock of where we are as individuals, as organizations, as nations and as a global community. It is most often a time for holiday festivities, celebrating traditions (whether secular or religious), gathering with family and friends, and taking some time for reflection and anticipation about the year ahead. And while all of these activities will surely occur, the uncertainty and anxiety that have characterized the 90 days since September 15th will surely cast a shadow over them. While we are now told that the recession currently swirling around us officially began at the end of 2007, the cyclone that has virtually blown away the global finance system as we had previously understood it has left us all stunned – and seeking safety or at least solace. The pace of both the seemingly endless bad news and the worsening economic conditions has correspondingly increased the pace of change at universities, medical schools, as well as large and small businesses – most often with job freezes, layoffs, programmatic reductions and dramatically altered expectations. We are certainly not immune to these changes and, as you well know, we have also implemented hiring freezes and numerous other policies in the past months – and there will be more to come as we seek to close the unexpected gap in this year's budget and begin budget planning for FY10. We also recognize that those plans will be significantly affected (in terms of the degrees of needed program change) by whether the continuing economic slide continues, stabilizes or improves.

While most of us look at the stock market as an indicator of the state of our economy, it is actually the credit crisis that is more important – especially since it has been worse than at virtually any time in USA history and, at least so far, has proven unresponsive to the various rescue and relief measures underway at national and global levels. Most experts view the current credit conditions as rivaling those of 1931 and 1826. And while some prominent economists believe that a rebound is imminent (or at least foreseeable) – once the credits freeze thaws – it is hard to espouse optimism until there is evidence that such a rebound is actually occurring. I am sure that you are also trying to understand the current conditions, including how we got here and, more importantly, how we will move from crisis to stability. I found the article by George Soros entitled “*The Crisis and What to Do About It*” in the December 4th issue of the New York Review of Books (see: <http://www.nybooks.com/articles/22113>) to be informative. And more recently, Paul Krugman, New York Times correspondent and 2008 Nobel Prize winner in Economics, wrote an interesting article in the December 18th issue of the New York Review of Books called “*What to Do*” (see <http://www.nybooks.com/articles/22151>).

As we look forward to the first hundred days following the January 20th Inauguration of Barak Obama, it seems increasingly likely to most experts that his impressive and far-ranging panel of advisors and leaders will, among other things, initiate a significant two year stimulus package – which seems likely to include science, technology and medicine. In addition, it appears increasingly likely that his team will also put healthcare reform high on the agenda, which makes sense given the magnitude of the healthcare sector, the impact that rising health care costs have on the general economy and the unsustainability of the current “system” in the USA.

This leads me to offer some optimism at year’s end – and as we stand at the beginning of the new era that lies ahead. First, regardless of the economic conditions, as a medical center and university we are carrying out valuable and socially redeeming work. Creating new knowledge, seeking to translate discoveries to improve human health and well being, and being willing to serve as advocates for science, technology and medicine – and the ways in which they can improve the human condition – afford us an opportunity to be part of the solution to our current global woes rather than part of the problem. Even so, we recognize that the ultimate solutions will require significant personal change, compromise, coordination and a re-calibration of expectations. Nonetheless there is reason to be hopeful.

We have the ability to make new and major fundamental discoveries. In addition, we recognize that a shift of focus away from disease *per se* and toward one that promotes personal wellness – a value already promoted at Stanford – is likely to be an important area of interest of the new Administration. I am hopeful as well that part of the stimulus package will restore funding to research in the biosciences – and, at a minimum, make that support more sustainable. There is also clear evidence that science will be valued in the new Administration, as evidenced by the appointment of Dr. Steve Chu as the Secretary of Energy and by the record and commitment of former Senator Tom Daschle, who is being proposed for Secretary of Health & Human Services. These appointments, along with the many others we have learned about in the past weeks, provide hope for

significant change that can redirect our national and global endeavors to more meaningful and valued goals.

On a more local level, our faculty continue to compete well for the decreased pool of grants, and they continue to receive awards and honors that reflect their distinction and value. Our students are terrific and our staff excellent and highly committed. We have much to be thankful for – and I am deeply grateful for your efforts and contributions.

Around us, we also see many changes pointing to opportunities that will transcend the current economic downturn. The Li Ka Shing Center for Learning and Knowledge is now being cloaked in the characteristic Stanford sandstone, and the Lorry Lokey Stem Cell Research Building is rising from the ground – its steel structure will be completed by February or March 2009. Over the past couple of days, I visited the Stanford Medicine Outpatient Center in Redwood City, which Stanford Hospital & Clinics will open on February 17th. It will house Orthopaedics & Sports Medicine, a Hand Therapy Center, a Pain Center, a Surgery Center, an Imaging Center and the Sleep Center. The facilities are outstanding and will provide comfort, care and dignity to the patients who receive care there – and the faculty and staff who will provide that care. And plans continue to develop for future research facilities, the New Stanford Hospital and the expansion of the Lucile Packard Children's Hospital. While these facilities, like our programs, will need to accommodate to the changing economic conditions, they are both individually and collectively important. They symbolize our future and our commitment to transforming the future and improving the lives and health of our communities.

So, even with the many challenges we all recognize and about which we feel anxiety and even fear, it is also important to look forward with optimism and with a spirit that allows us to stay focused and do good things, so that the years ahead will be bright – and so that we will help to make them so. In that spirit I wish each of your families a very happy holiday – and of course, hope for the year(s) ahead.

Generating Ideas About How to Fund Future Research During a Time of Constraints

One of the action items of our Strategic Planning Leadership Retreat in January 2008 grew out of the recognition that we needed to focus on new ways of generating support for our research missions given the continued declines in federal support for research. These concerns have been rising for years and significantly antedate the current financial crisis. But they are certainly amplified and made even timelier by world economic events. With that in mind, at the December 5th Executive Committee meeting, Marcia Cohen, Senior Associate Dean for Finance and Administration, along with Dr. Harry Greenberg, Senior Associate Dean for Research, discussed the results of a one-day retreat on research funding that was held on October 25th and that sought ideas about how to diversify our research funding portfolio and make it more sustainable. Over 20 faculty, representing the basic and clinical science disciplines across the School, participated. They reviewed past trends and began to think broadly about how we might change our practices and approaches to enhance our success.

The group brainstormed ideas in five categories and then voted on the top ideas in each category. Over 100 ideas were generated. To give you the flavor of the discussion, here are the categories and top three ideas in each (The full list may be obtained from Kathy Gillam at k.gillam@stanford.edu):

- ***Increasing diversification of funding sources***
 - Improve department-based faculty access to philanthropy
 - Team-up with School of Engineering programs: better coordination with all Stanford schools
 - Better response to RFAs
- ***Sustaining existing programs***
 - Create collaboration incentives
 - Improve clinical trials approval process and infrastructure
 - More investments to promote clinical and populations-based research
- ***Enhancing faculty and institutional competitiveness***
 - Enhance competitiveness of MCL for research (recruitment, time, resources)
 - Loosen restrictions on PI status
 - Pre-submission peer review of proposals
- ***Creating incentives for collaborative or interdisciplinary research***
 - Incentives for brainstorming at early stages
 - Improve access to consultation resources (biostatistics, etc.)
 - Improve focus of institutes
- ***Using research funding and space more efficiently and cost effectively***
 - Identify options to outsource core services
 - Rethink hotel space
 - Off-site storage space (freezers, biospecimens, etc.)

These are, of course, preliminary ideas, and each, along with the many others that were generated, will require much more vetting and development before being implemented. Nevertheless, they represent an important start, and I look forward to seeing their further development in the months ahead. I welcome your thoughts as well, both about these ideas and about others you might have, and hope you will communicate any ideas or suggestions to me (ppizzo@stanford.edu), Marcia Cohen (marcia.cohen@stanford.edu), Dr. Harry Greenberg (harry.greenberg@stanford.edu) or Dr. Daria Mochly-Rosen (mochly@stanford.edu).

Important New Rules on Privacy and Data Security: Be Aware

It is extremely important that you are aware that two new patient privacy laws taking effect in California on January 1, 2009 can impact you personally and professionally.

Indeed these new laws increase patient privacy protections but also add new requirements, fines and penalties – which can affect you directly and individually. I have been asked by our Compliance Officers to make you aware of these two new laws:

1. ***Senate Bill 541*** authorizes the California Department of Public Health (CDPH) to investigate unlawful or unauthorized access to, or viewing, use or disclosure of, patient information. This bill requires the hospital to report any such unauthorized access, viewing, use or disclosure of patient information within five days of its detection to CDPH and to the patient. Hospital fines for failing to prevent unauthorized access are up to \$25,000 per patient whose medical information was breached, maximum \$250,000 per reported breach.
2. ***Assembly Bill 211*** authorizes a new California state office, the Office of Health Information Integrity (OHII), to investigate and enforce existing medical privacy laws and to investigate individuals and assess penalties against individuals for unauthorized access to or viewing, use or disclosure of patient information. The fines to individuals range from \$2,500 to \$250,000 for violations. No defense or indemnity coverage is provided by the hospital's insurance policies for fines that are incurred by individuals due to violations. The fines are the personal responsibility of the individual. SB 541 requires the hospital to report individuals who violate patient privacy laws. Additionally, this new law authorizes OHII to report such violations to an individual's licensing board for disciplinary action through the licensing board, and the licensing board is required to investigate such referrals.

Please note that AB 211 places the financial burden directly on the individual (doctor, nurse, trainee, etc) and that it becomes the responsibility of the individual to pay the fines – which can be quite significant. SB541 mandates that hospitals monitor and report any unauthorized activity. Accordingly, beginning January 1, 2009, the SHC/LPCH Compliance and Privacy Department will be conducting increased monitoring activities of our electronic patient systems to determine compliance with these two new laws and will be submitting mandatory reports to state enforcement agencies regarding individuals who made inappropriate and unauthorized access to patient information systems.

It is important that you remember to only access patient information that you need to perform your job functions for the hospital and that you do not access patient information for any other reason. I have referred to this in prior communications and want to underscore that this means that you cannot and should not access information on anyone other than patients for whom you have a direct care responsibility. Moreover, if you suspect inappropriate or unauthorized access by any individual to SHC/LPCH patient systems, you must report such to the Compliance and Privacy Department by emailing to PrivacyOfficer@stanfordmed.org, calling the department at 724-2572, or you may make an anonymous call to the compliance and privacy hotline at 1-800-216-1784. SHC/LPCH will not retaliate against any individual who reports in good faith potential violations of laws or hospital policy.

A joint LPCH/SHC/University/School of Medicine steering committee is currently working on implementation of the new requirements under these two new laws and will provide additional information in the near future.

For additional information, please contact the SHC/LPCH Chief Compliance and Privacy Officer, Diane Meyer, at 724-2572 or PrivacyOfficer@stanfordmed.org.

Updating Policies on Stanford Industry Relations

The revelations regarding conflicts of interest and related infractions rival economic disclosures and politics as front-page items in prominent newspapers. On December 12th, the New York Times ran a story about how major pharmaceutical companies have hired “ghost writers” to prepare manuscripts for academic physicians (see: <http://www.nytimes.com/2008/12/12/business/13wyeth.html?scp=1&sq=ghost%20writing&st=cse>). Such a practice is clearly at odds with academic scholarship and has no place in academic medicine. And yet industry and medical school faculty have clearly engaged in it. I hope this activity has not occurred at Stanford, since it would seem to violate a fundamental standard of scholarship and academic integrity. Moreover, we banned ghost writing in our Stanford Industry Interactions Policy (SIIP) in October 2006 (see: <http://med.stanford.edu/coi/siip/>). Thankfully, Stanford School of Medicine, in conjunction with Stanford Hospital & Clinics (SHC) and Lucile Packard Children’s Hospital (LPCH), was among the first institutions in the nation to embrace such policies. It is now clear that the actions we took are rapidly becoming the standard of practice across the nation.

To remind you, among the provisions of the 2006 SIIP are:

- Highly restricted access by sales and marketing representatives to the Medical Center campus
- A ban on the acceptance of personal gifts from industry representatives anywhere at the Medical Center
- The separation of industry support from educational decisions (for example, the choice of recipients of industry-funded fellowships; the choice of topic, speaker or content in industry-supported lectures, etc.)
- A prohibition against ghost-written articles (i.e., articles written by company employees but with a Stanford faculty member as author)

After two years’ experience with the policy, we realized that it needed to be updated. For instance, the original SIIP policy relied on the national CME accreditation organization’s Standards for Commercial Support to govern industry interactions in this area. We now know these standards are inadequate, and in August 2008 we implemented a new CME commercial support policy (http://cme.stanford.edu/commercial_support.html), which needed to be incorporated into the parent policy. In addition, greater clarity was needed concerning participation in meetings or conferences supported by industry to make explicit, among other things, that participation in so-called speakers bureaus is contrary to the policy. Finally, changes in the Stanford Hospital and Clinics governance structure,

particularly as it relates to the medical staff, resulted in the need to clarify to whom various provisions of the policy apply. Other minor updates were also in order.

A small working group in the Dean's Office consisting of Dr. Kathy Gillam, Senior Advisor to the Dean; Dr. Harry Greenberg, Senior Associate Dean for Research; and Barbara Flynn, Manager of the Conflict of Interest Review Program, has been reviewing and updating the policy. They have been coordinating their efforts with Dr. Kevin Tabb, Vice President for Medical Affairs at SHC, and Dr. Christy Sandborg, Chief of Staff at LPCH. Once the revised policy is approved (hopefully early in 2009), it, along with updated FAQs, will be posted on the SIIP web site.

SIIP continues to be the defining document for our interactions with industry in the clinical care and educational areas. Given the prominence of these issues in the public domain and the changing landscape of conflict of interest, it is important that we maintain the currency of the policy and that all of us assure that our own interactions with industry comply with the provisions of SIIP.

Pediatric Mentoring and Faculty Development

On December 1st, I was pleased to attend a meeting of the Pediatric Mentoring Program. This program was launched in October 2007, thanks to the leadership of Dr. Christy Sandborg, Professor of Pediatrics and Chief-of-Staff at LPCH. It is designed to promote the career development of junior investigators in pediatrics and recognizes the value and importance of mentoring. The Program, which currently includes 8 mentors and 30 mentees, is one of several programs in the Medical Center that focus on mentoring and leadership training. Collectively they offer a truly important resource for junior faculty, for whom career development is such a critical issue. Thanks to Dr. Sandborg and the team of pediatric mentors for their efforts and commitment to foster the careers of their junior colleagues.

Developmental Biology – Then, Now and in the Future

At the December 5th Executive Committee, Dr. Roel Nusse, Professor and Chair of the Department of Developmental Biology (DB) gave an update on the department. A brief summary of his comments follows:

Founded in 1989, the Dept. of Developmental Biology has steadily grown to a present size of 11 primary UTL faculty members, out of a total of 19 when secondary and other appointments are included. Of the UTL faculty, 8 are at the full professor level, reflecting the current maturity of the department. The faculty distinguishes itself in being recognized by memberships of the National Academy of Sciences (5) and support from the Howard Hughes Medical Institute (5). The mission of the department is to promote innovative research in many aspects of developmental biology, including the principals and molecular mechanisms that guide embryonic development, the differentiation of adult cell types, stem cells, regeneration, and aging. This work is related to a number of human diseases, including cancer, diabetes and various degenerative diseases. The department is very active in teaching and has recently initiated courses for graduate and

undergraduate students in stem cell biology, computational biology, and aging. DB is also actively involved in teaching fundamental aspects of cell biology in the Human Biology program on the main campus, covering part of the core curriculum. In the School of Medicine, the department is responsible for the first year course DB201, Development and Disease Mechanism. The department is housed in the Beckman Center (third floor).

Over the past three years, the department has recruited several outstanding scientists. Phil Beachy, a renowned developmental biologist being one of the leaders in the Hedgehog signaling field; and Gill Bejerano, a computational biologist chemist who has developed new methods for analyzing whole genomes and finding conserved regulatory sequences. Dr. Bejerano has a joint appointment in the department of computer science, reflecting the integration of DB in other academic departments, even outside of the School of Medicine. Moreover, DB now includes Joanna Wysocka as a secondary appointee, together with the Dept. of Chemical and Systems Biology. She investigates the epigenetic regulation of gene expression.

These newly and previously appointed faculty are listed on the departmental website (see: <http://devbio.stanford.edu/>).

Graduate student training is funded in part by training grants but our graduate students and postdocs have received numerous prestigious fellowships and awards. While the current funding climate poses difficulties for the continuation of some research efforts, DB faculty have done remarkably well in securing grant support and there is an optimistic outlook for the future.

Awards and Honors

- **Dr. Steven Chang, MD** was named the first incumbent of the Robert C and Jeannette Powell Neurosciences Professorship at a celebration held on December 3rd. Congratulations to Dr. Chang.
- **Dr. David Magnus, PhD**, Associate Professor (Teaching) of Pediatrics (Medical Genetics) and, by courtesy, of Medicine, was recently elected Vice President (and President Elect) of the Association of Bioethics Program Directors. Congratulations to Dr. Magnus.
- **Dr. Emmanuel Mignot, MD, PhD** was officially announced as the first incumbent of the Craig Reynolds Professorship at a wonderful event held on December 1st. Congratulations to Dr. Mignot.
- **Geoffrey D. Rubin, MD**, Professor of Radiology, Associate Dean for Clinical Affairs and Vice Chief of Staff, has been awarded the 2008 "Minnie" as the "Most Effective Radiology Educator" from AuntMinnie.com, the world's largest and most comprehensive online medical imaging community. They recognize two outstanding imaging scientists or physicians annually with individual Minnies. Congratulations to Dr. Rubin.

Appointments and Promotions

- **Niaz Banaei** has been appointed to Assistant Professor of Pathology and of Medicine at the Stanford University Medical Center, effective 12/01/08.
- **Steven Binder** has been promoted to Clinical Assistant Professor of Ophthalmology, effective 10/01/08.
- **Brian Blackburn** has been reappointed as Clinical Assistant Professor of Medicine (Infectious Diseases), effective 9/01/08.
- **Richard Bland** has been reappointed to Professor (Research) of Pediatrics effective 12/01/08.
- **M. Gail Boltz** has been appointed Clinical Professor of Anesthesia, effective 12/01/08.
- **Anna Bruckner** has been reappointed to Assistant Professor of Dermatology at the Stanford University Medical Center and of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 12/01/08.
- **James Byrne** has been reappointed as Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/08.
- **Ann M. Chen** has been appointed as Clinical Assistant Professor of Medicine (Gastroenterology and Hepatology), effective 1/01/09.
- **Ivan Cheng** has been reappointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 12/01/08.
- **Justin Choi** has been promoted to Clinical Assistant Professor (Affiliated) of Surgery (General Surgery), effective 9/01/08.
- **Jennifer Cochran** has been reappointed to Assistant Professor of Bioengineering, effective 1/01/09.
- **Sallie G. DeGolia** has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Adult Psychiatry), effective 2/01/09.
- **Karl Deisseroth** has been promoted to Associate Professor of Bioengineering and of Psychiatry and Behavioral Sciences, effective 1/01/08.
- **Amr L. Dessouki** has been appointed as Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 9/01/08.
- **Archana Dubey** has been reappointed as Clinical Assistant Professor of Medicine (Family and Community Medicine), effective 9/01/08.

- ***Ruth M. Fanning*** has been promoted to Clinical Assistant Professor of Anesthesia, effective 12/01/08.
- ***Kim Gray Hazard Florette*** has been appointed to Assistant Professor of Pathology and of Pediatrics at the Stanford University Medical Center, effective 12/01/08.
- ***Sara L. Gandy*** has been appointed as Clinical Associate Professor of Psychiatry and Behavioral Sciences (Adult Psychiatry – Geriatrics), effective 1/05/09.
- ***Gerald Goresky*** has been appointed as Clinical Associate Professor of Anesthesia, effective 1/05/09..
- ***Antonio Y. Hardan*** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 12/01/08.
- ***Joseph Hopkins*** has been reappointed as Clinical Professor of Medicine (Family and Community Medicine), effective 9/01/08.
- ***Yi-Chao Huang*** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 12/01/08.
- ***Audrey Kuang*** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 12/01/08.
- ***Swaminatha V. Mahadevan*** has been promoted to Associate Professor of Surgery at the Stanford University Medical Center, effective 12/01/08.
- ***Artis Montague*** has been reappointed as Clinical Assistant Professor of Ophthalmology, effective 8/01/08..
- ***Faisal Mirza*** has been reappointed as Clinical Assistant Professor of Orthopaedic Surgery, effective 12/01/08.
- ***Lynn K. Ngo*** has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08..
- ***Patrick O’Callahan*** has been appointed as Clinical Assistant Professor of Medicine (General Internal Medicine), effective 12/16/08.
- ***William Davidson Ogden*** has been appointed as Clinical Associate Professor of Cardiothoracic Surgery (Adult Cardiac Surgery), effective 12/01/08.

- **Tom Ormiston** has been promoted to Clinical Associate Professor (Affiliated) of Medicine (General Internal Medicine), effective 12/01/08.
- **John B. Pollard** has been reappointed to Associate Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 12/01/08.
- **Keith Polsey** has been reappointed as Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/08.
- **Andrew Quon** has been reappointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 12/01/08.
- **Kim F. Rhoads** has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 12/01/08.
- **Beth E. Robie** has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/01/09.
- **Erika Rubesova** has been reappointed as Clinical Assistant Professor of Radiology (Diagnostic Radiology), effective 8/01/08.
- **Andrew A. Shelton** has been appointed as Clinical Associate Professor of Surgery (General Surgery), effective 2/10/09.
- **John M. Stevenson** has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery (General Surgery), effective 9/01/08.
- **Norman H. Silverman** has been appointed Clinical Professor of Pediatrics (Pediatric Cardiology), effective 12/01/08.
- **Matthew W. Smuck** has been appointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center effective 12/15/08.
- **Brent Tan** has been promoted to Clinical Assistant Professor of Pathology, effective 12/01/08.
- **Jean Y. Tang** has been appointed to Assistant Professor of Dermatology at the Stanford University Medical Center, effective 1/01/09.
- **Pedro P. Tanaka** has been appointed Clinical Associate Professor of Anesthesia, effective 1/01/09.
- **Clare J. Twist** has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 11/01/08.

- **Thomas J. Wandless** has been appointed to Associate Professor of Chemical and Systems Biology, effective 12/01/08.
- **Marius Wernig** has been appointed to Assistant Professor of Pathology, effective 12/01/08.
- **Nora Woiwode** has been promoted to Clinical Assistant Professor of Medicine (Primary Care – Adult Urgent Care), effective 10/01/08.

Dean's Newsletter January 19, 2009

Thinking About the Year(s) Ahead

Although the publication date for this first Newsletter of 2009 is January 19th, it is being posted and distributed on January 20th since the 19th was the national holiday in honor of Dr. Martin Luther King, Jr. As you well know, this year there is a historic connection and alignment of the 19th and 20th of January - the inauguration of Barack Obama will have taken place today by the time you receive this, almost 41 years after the assassination of Dr. King. While we have all been reeling in response to the dramatic economic changes that have transfigured our nation and much of the world, today we celebrate not only a realization of the “American dream” but also an extraordinary time of hope and promise with the election of Barack Obama as our 44th President.

It is of course enormously important to be optimistic about our individual and collective futures – as a community and as a nation. But it is equally important to be realistic about the current world order and to anticipate and plan for future challenges that can transform our institution in ways we can control – or not control. Thankfully, we began our institutional planning nearly eight years ago, when we developed our strategic plan, ***Translating Discoveries***. Indeed, during this time, due to the important contributions from many of you, we have been transforming Stanford Medicine across its missions and landscape. Because we are bombarded by so much bad news, it may be helpful to remind you of some of the things we have accomplished together in the past several years:

1. *In Education*

- a. The New Stanford Medical Education Curriculum
- b. Improved support for graduate student tuition and education
- c. The Masters in Medicine Program for PhD students
- d. The Advanced Residency at Stanford Program for clinical fellows

2. *In Research*

- a. Supporting faculty and opportunities for basic science research – including support for recruitment and related resources
- b. Success in achieving an NIH Clinical and Translational Science Award
- c. Success in becoming an NCI-Designated Center

- d. Provision of seed grants through the Institutes and other institutional programs that foster innovative and collaborative research

3. *In Patient Care*

- a. Coordinated strategic and programmatic planning with both Stanford Hospital & Clinics (SHC) and Lucile Packard Children's Hospital (LPCH)
- b. In collaboration with SHC and LPCH, dramatic improvements in the financial performance of both institutions
- c. Improvement in the financial support for clinical faculty through the "Funds Flow" methodology (now in its third year SHC and pending with LPCH)
- d. In collaboration with LPCH and SHC, significant improvements in quality performance
- e. Recruitment of clinical faculty and program leaders (including division directors and chairs)

4. *Interdisciplinary and Programmatic Initiatives*

- a. Formation of the Stanford Institutes of Medicine and Strategic Centers
- b. Founding and development of the Joint School of Medicine- School of Engineering Department of Bioengineering – a first at Stanford.

5. *Academic Development and the Workplace*

- a. Significant improvements in promoting a respectful workplace
- b. Creation of the Office of Diversity and Leadership
 - i. The Faculty Fellows Program
 - ii. Coordination with SHC and LPCH in their Leadership/Mentoring Programs
- c. Development of an electronic system for managing the faculty appointments and promotions processes
- d. Reclassification of academic appointments and tracks and progress in delineating the role and expectations for faculty engaged in our missions of research, education, patient care as well as institutional and community service

6. *Integrated Institutional and Facilities Planning*

- a. Delineation of the School of Medicine Master Facilities Plan – which extends over the next 10-15 years – and which will bring physical harmony and organization to the School and Medical Center
 - i. Phase I for the School of Medicine consists of the construction projects now underway, which represent a \$350 million investment. They include the connectivity projects (loading dock and tunnels that will provide underground infrastructure and delivery to the medical school campus), the Li Ka Shing Learning and Knowledge Center, which will be completed in the Spring of 2010, and the Lorry Lokey Stem Cell Research Building/Stanford Institutes of Medicine I – to be completed in the summer of 2010.
- b. Coordination of programmatic and capital planning throughout the Medical Center
- c. Coordination with SHC on the move to the Stanford Medicine Outpatient Center that opens in Redwood City this February.

- d. Major planning for off-site facilities for administrative staff in Menlo Park (and in the future the North Campus) as well as new leased facilities for research in Palo Alto (California Avenue and an expansion at Arastradero Avenue) – that have become available in 2008 and will continue to open over the next year.
- 7. *Improved Interactions Among Faculty Within the Medical School and With the University – the Basis for Cultural Transformation***
- a. The divide between basic and clinical science leaders that was so dominant when I first arrived has been bridged – although there is always going to be work to do in bringing our diverse community into alignment.
 - b. The negative relations with the greater university that existed during and following the merger and de-merger (and almost certainly prior to that) have been very significantly reversed and improved.
- 8. *Improvements in Communications Within and Outside of Stanford***
- a. A decade ago Stanford Medicine was portrayed quite negatively in the press, which tended to focus on its negative and hostile workplace and only in a limited way on the role that Stanford Medicine played in transforming health and science. That pattern of communication has been reversed – both because of the improvements in our work place and the contributions of our faculty and through the efforts of our Office of Communication and Public Affairs.
- 9. *Leadership in Public Policy and Related Initiatives***
- a. Stanford has played a leadership role in advocacy and support for research – including funding at both the State and National levels – and in efforts to reverse the anti-science views that have been so dominant during the past eight years.
 - b. Stanford has played a leadership role in addressing issues of conflict of interest in education, research and patient care.
- 10. *Success in Fundraising***
- a. During the last several years Stanford Medicine’s success in fundraising has been among the best compared with medical schools in the nation. Even though the years ahead will be challenging, we have made major progress in this area (although, as noted below, we will need to search for a new Director of the Office of Medical Development)

While it is helpful to look backward – at least to reflect briefly on where we have been – it is more important to be looking forward. Needless to say, the current economic landscape makes progress more challenging (as I have outlined in Newsletters during the last months of 2008 – see: http://deansnewsletter.stanford.edu/archive/11_03_08.html, http://deansnewsletter.stanford.edu/archive/11_17_08.html, http://deansnewsletter.stanford.edu/archive/12_15_08.html). Our task now is to re-calibrate our priorities, anchor them against our bigger dreams and aspirations, and continue moving forward.

Interestingly, I spent this past weekend at the annual Retreat for the Board of the Association of Academic Health Centers, where I serve as a Board Member and Chair-

Elect. Not surprisingly, an important focus of discussion was the rapidly changing landscape we have been discussing – but framed at a national level. Each of the eleven board members represent different facets of American academic health centers, which include public and private institutions, those with a single professional school and those with multiple schools, those with large regional systems and those that are more narrowly defined, and those that are more research intensive than others, as well as institutions located in the Northeast, South, Central and South Central as well as the West. The issues and concerns among different institutional leaders varied, but there were a number of common themes.

First, each center has been impacted significantly economically– by loss of state support (or its pending loss), loss of endowment income, concerns about cash flow and the influence of further job loss as well as increases or decreases in state and federal entitlement programs. We shared in common our concerns about support for education and research – although the focus and areas of concentration varied considerably among the institutions and leaders. But all shared the perspective that business as usual was certainly changing and that the solutions of the past years and decades will have less, or even little, relevance going forward. Notable were concerns about growth and especially debt – which was more commonly attributed to the clinical than the basic science arms of the programs. We all expressed concerns about how health care reform will both benefit and potentially challenge academic medical centers. We noted in particular that the health care plans recently outlined by Secretary of HHS Tom Daschle (***Critical: What We Can Do About the Health Care Crisis***) and by Zeke Emmanuel (***Healthcare Guaranteed: A Simple, Secure Solution for America***), recently named as Senior Advisor to the White House Office of Management and Budget for Health Policy, are silent in reference to academic centers, education and research.

We are all anticipating the proposals the Obama Administration and the leaders in the Congress will put forward to address the multifaceted and inter-digitating issues that impact a wide array of domestic and international issues. Some glimpses are becoming available with the release of the “American Recovery and Reinvestment” proposal by the House, which proposes major investments, as follows: 1) Create Jobs with Clean, Efficient, American Energy; 2) Transforming Our Economy with Science and Technology; 3) Modernize Roads, Bridges, Transit and Waterways; 4) Education for the 21st Century; 5) Lower Healthcare Costs; 6) Help Workers Hurt by the Economy; 7) Save Public Sector and Protect Vital Services; 8) Other Important Policy Provision – focusing on Medicare and Medicaid. Each section has considerable detail, and major expenditures are proposed to “stimulate” the economy. There will surely be debate and compromise about these and related proposals, but there seems little doubt that something significant will come forth, likely by mid-February. What is – and is not – included in the stimulus package will certainly affect our academic medical centers as well as science and medicine more broadly.

There are additional details in the American Recovery and Reinvestment proposal that are more closely connected to our specific concerns in science and medicine. I detail a few of them here, while recognizing that they are all subject to debate and change. But

this is the starting point. For instance in the section on Transforming our Economy with Science and Technology, some specific details are given that are of interest:

- National Science Foundation (NSF): \$3 billion, including \$2 billion for expanding employment opportunities in fundamental science and engineering to meet environmental challenges and to improve global economic competitiveness, \$400 million to build major research facilities that perform cutting edge science, \$300 million for major research equipment shared by institutions of higher education and other scientists, \$200 million to repair and modernize science and engineering research facilities at the nation's institutions of higher education and other science labs; \$100 million is also included to improve instruction in science, math and engineering.
- NIH: \$2 billion, including \$1.5 billion for expanding good jobs in biomedical research to study diseases such as Alzheimer's, Parkinson's, cancer and heart disease, and \$500 million to implement the repair and improvement strategic plan developed by the NIH for its campuses.
- University Research Facilities: \$1.5 billion for NIH to renovate university research facilities and help them compete for biomedical research grants.
- Center for Disease Control (CDC): \$462 million to enable CDC to complete its Building and Facilities Master Plan as well as renovations and construction needs of the National Institute for Occupational Safety and Health
- Biomedical Advanced Research and Development, Pandemic Flu and Cyber Security: \$900 million to prepare for a pandemic influenza, support advanced development countermeasures for chemical, biological, radiological and nuclear threats and for cyber security protections at HHS
- In addition, significant support is proposed for the Department of Energy, NASA, National Oceanic and Atmospheric Administration, National Institutes of Standards and Technology, Agricultural Research Service and the US Geological Survey.

The section entitled "Lower Healthcare Costs" contains a number of relevant provisions, including:

- Health Information Technology: \$20 billion to jumpstart efforts to computerize health records to cut costs and reduce medical errors
- Prevention and Wellness Fund: \$3 billion to fight preventable chronic diseases.
- Healthcare Effectiveness Research: \$1.1 billion for Healthcare Research and Quality programs to compare effectiveness of different medical treatments funded by Medicare, Medicaid, and SCHIP.
- Community Health Centers: \$1.5 billion, including \$500 million to increase the number of Americans who receive quality health care and \$1 billion to renovate clinics and make health care technology improvements.
- Training Primary Care Providers: \$600 million to address shortages and prepare for universal healthcare by training primary healthcare providers including doctors, dentists, nurses as well as helping pay medical expenses for students who

agree to practice in underserved communities through the National Health Service Corps.

- Indian Health Service Facilities: \$550 million to modernize aging hospitals and health clinics and make healthcare technology upgrades to improve health care for underserved rural populations.

The specifics of these proposals will surely undergo further debate, but I share them with you to offer some notion of where the Administration and the Congress will be focusing their efforts in the next weeks. Of course, these proposals are only partially related to the larger effort of major healthcare reform, which is still said to be very high on the agenda of the White House and Congress. You might wish to look at two articles in the January 15th issue of the New England Journal of Medicine that offer some additional perspective on this topic: JK Inglehart “*Visions for Change in US Health Care – The Players and the Possibilities*” (see: <http://content.nejm.org/cgi/content/full/360/3/205>) and VR Fuchs “*Health Care Reform – Why So Much Talk and So Little Action*” (see: <http://content.nejm.org/cgi/content/full/360/3/208>).

Within this context – and keeping in mind the path we have been traveling with our Strategic Plan, “*Translating Discoveries*” – we have much to think about and consider for the years ahead. Clearly one important factor is to have a plan and, while ours is hardly perfect in all regards, it has helped us to sustain some focus on our key missions and to benchmark our progress. But we also need to be flexible and prepared for major shifts that will require re-calibration while staying true to our mission and avoiding formulaic or generic change that would result in a loss of our uniqueness and identity. Achieving this balance is predicated on assuring that we have the resources we need to move forward, including financial, capital and, most importantly, the human capital – our faculty, students and staff – that truly differentiates Stanford from other medical schools.

In addition to continuing our focus on the ten mission and support areas noted above, I would like to highlight several related goals and objectives that will require increased attention over this and future years. They include:

- ***Fostering Career Development and Satisfaction.*** As noted above, our most important asset is the quality of each of you - our faculty, students and staff. Far more than our facilities and other resources, it is your intelligence, creativity, vision and hard work that make Stanford the unique institution it is today. That said, we are comprised of groups who have very different roles – in research, patient care and education, including those who are teachers and learners and those who help make our missions successful. Whether one’s primary focus is research or patient care, each member of our community faces significant pressures – many of which have been exacerbated in recent years. I am also well aware of how easy it is for one group within a complex environment to feel more or less valued than others, due to longstanding cultural issues, perceived and real priorities and a series of internal and external forces. With that in mind, one of my major themes this year will be to seek ways of fostering faculty career development and satisfaction across our missions. Indeed, this will be the major

topic of our Strategic Leadership Retreat on February 6-7th, and I anticipate having a number of concrete recommendations to share with you in the months ahead.

- ***Stewarding Our Resources and Investing in the Future.*** I won't review all of these issues again, having covered many in recent Newsletters. But clearly, given the dramatic economic changes that have occurred – and continue to occur, we must be realistic about what we can afford to do and what needs to be deferred. Here our Strategic Plan helps provide a compass, but we must also be mindful of new opportunities based on what unfolds from the federal stimulus package, the negative impact of the State economy or the forces that may guide healthcare reform. Of particular note is that we want to continue to invest in outstanding people who propose exciting programs. And we want to do all we can to provide bridge support for faculty who may experience transient downturns in funding.

Of course this means that we need to be sure that we have secure reserves and that we do not become over leveraged on debt or expectations. Thankfully, the debt burden for the School of Medicine is relatively low, and it is important that we keep it low given the uncertainties of cash sources and flows in the immediate future. Also, while we have had to put a hold on basic science recruitments this year, we surely want to find ways to selectively invest in key recruitments in the not too distant future, since that is the best way of assuring our future success in research excellence. In addition, we also need to recruit outstanding clinicians-educators and clinician-scholars to key areas of need and opportunity. This includes primary care as well as our cancer programs along with other important clinical programs.

- ***Making Our Systems Work Better.*** We are all aware that the increased emphasis on compliance and regulatory issues has stifled some of our efforts – or at least it is being felt that way. It is important that we continuously examine our systems and do all we can to reduce unnecessary or unneeded bureaucracy – and do all we can to make things work better and more effectively. This is a very high priority for our Finance and Administration leaders.
- ***Make Our Healthcare Programs at SHC and LPCH More Patient Centric and Better Address the Sustainability and Enhancement of Excellence of Stanford Medicine.*** In recent years we have focused considerable effort on improving the quality of patient care programs for the hospital and the physicians. We have made progress, although much work remains. But we have not focused enough on the value of professionalism and patient centric care – a topic I addressed in my December 1st Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_01_08.html#1). This must be a high priority for all of us – which if we do not address, will surely undermine and erode our value to patients and providers. In tandem with this, we must also recognize that the healthcare market in northern California is consolidating with two major systems, Kaiser and Sutter, dominating the Bay Area. Accordingly we

need to develop new programs and systems that permit us to relate to our community physician colleagues and to train and develop physicians (both in primary care and specialty areas) who will join regional communities in continued partnership with Stanford.

- ***Be Leaders in Communication, Policy and Advocacy:*** Clearly as the world rapidly changes, we need to do all we can to have a seat at the table in the policy debates and discussions that will impact science funding and support as well as the future of healthcare reform. We can do this both through Stanford and in partnership with regional and national professional groups and societies. I am currently doing what I can in my Board and leadership roles at the Institute of Medicine, the AAMC, the Association of Academic Health Centers, the California Healthcare Institute, the California Institute for Regenerative Medicine and the Foundation for the NIH. Many of you hold important leadership roles in state and national organizations and societies and can play an important role in your advocacy for science and medicine during this time of dramatic change.
- ***Digging Deeper Wells:*** At times of resource constraint we need to open new wells and resources by getting our message out more broadly, developing new relationships and providing insights and opportunities about why investment in Stanford Medicine is valuable – and worth doing. And then we need to re-think about how to use investments to better support students and faculty at different stages of their career development. For decades medical schools have been highly leveraged on federal support and while that conduit needs to be sustained, we also need to find new and more diversified support pipelines and to distribute resources in a manner that makes the whole greater than the sum of our parts.

Clearly there is much to think about – and while there are many areas of concern – we need to keep our eyes on the areas of opportunity where we can play an important role both for Stanford and for our broader community. As I complete these words on Martin Luther King, Jr. Day, I end with his words – which are still highly relevant and deeply moving: *"...tomorrow is today. We are confronted with the fierce urgency of now...Now let us begin. Now let us rededicate ourselves to the long and bitter, but beautiful, struggle for a new world...to transform the jangling discords of our world into a beautiful symphony of brotherhood."*

Thanks and Best Wishes to Doug Stewart

Doug Stewart, our Associate Vice President for Medical Development, has decided to leave Stanford for a consulting practice at Marts & Lundy – a change he has been considering for some time. I want to begin by thanking Doug for the exceptional leadership he has provided to the School of Medicine Office of Medical Development. When Doug arrived at Stanford in 2004, OMD needed a major rejuvenation and Doug did just that. In his first two years he and his colleagues recruited over three dozen excellent leaders, he reorganized the program and activities, participated in the development of a strategic plan to improve our fund-raising activity and led the OMD to

achieve the highest recorded fundraising successes in its history over the past 2-3 years. This included meeting or exceeding the fundraising targets for both the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell Research Building/Stanford Institutes of Medicine 1 – both of which are now under construction. Importantly, he and the OMD staff collaborated with chairs and faculty throughout the School to raise funds for new professorships, programmatic initiatives, seed grants and incredible support from foundations and individuals. It has been a remarkable journey.

Of course we all recognize that the current economic downturn has taken the wind out of the fundraising sails. But Doug and OMD have positioned us well for continued stewardship and for future fundraising success when the economic situation improves in the (hopefully near) future.

We will be recruiting Doug's successor, while acknowledging that he will be hard to replace. We will miss him and wish him well during the next exciting phase of his career.

2008 Faculty Fellows Celebrate Graduation on January 13th

Recognizing that career development and the training of future leaders are among the most important goals for Stanford Medicine, I was once again honored to attend the graduation ceremony for the 2008 Faculty Fellows. This program was launched three years ago by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, and it has proven to be a wonderful success. Among the measures of its success is the degree to which the faculty selected to participate in this program gain confidence and skills for leadership, become better aligned with their Department Chair and cognizant department and begin to feel that they are part of the greater Medical School and Medical Center community. At each graduation event we have the opportunity to hear the perspective of the senior faculty member (or department chair) who nominated the faculty member to participate in the program, as well as the reflections of the participating Faculty Fellows. These further affirm the value of this program and how much it is appreciated. The success of the program is also a reflection of the tremendous efforts and commitment of Dr. Valantine as well as Julie Moseley, Director of Organizational Effectiveness, along with Jennifer Scanlin, Program Director, and Lydia Espinosa, Administrative Associate.

Special thanks also go to the senior faculty mentors who meet regularly with assigned groups of Fellows and provide guidance, education, mentoring and a sense of community. This years Mentors included: Linda Boxer, Professor of Medicine, Al Lane, Professor and Chair of Dermatology and Oscar Salvatierra, Professor of Surgery Emeritus.

One of the wonderful things about this program is that a mentoring community emerges among physicians and scientists with very diverse backgrounds and interests. The view that basic or clinical science faculty can only be effectively mentored by someone who shares similar experiences or disciplines is proved fallacious – since in the program basic or clinical faculty learn about career developments across and beyond traditional

discipline-based boundaries. This further affirms how much we can share and learn from each other as a Stanford Medicine community.

The 2008 Faculty Fellows who completed their program on January 13th included:

- ***Ranjana Advani***, Associate Professor of Medicine
- ***Howard Chang***, Associate Professor of Dermatology
- ***Sanjeev Dutta***, Assistant Professor of Surgery (Pediatric Surgery)
- ***Rebecca Fahrig***, Associate Professor of Radiology
- ***Julietta Gabiola***, Clinical Assistant Professor of Medicine
- ***Jill Helms***, Associate Professor of Surgery (Plastic Surgery)
- ***Paul Keall***, Associate Professor of Radiation Oncology (Radiation Physics)
- ***Christina Kong***, Associate Professor of Pathology
- ***Joseph Liao***, Assistant Professor of Urology
- ***Swaminatha Mahadevan***, Associate Professor of Surgery (Emergency Medicine)
- ***Bruno Medeiros***, Assistant Professor of Medicine
- ***Carlos Milla***, Associate Professor of Pediatrics
- ***Tirin Moore***, Assistant Professor of Neurobiology
- ***Upinder Singh***, Assistant Professor of Medicine
- ***Roland Torres***, Clinical Associate Professor of Neurosurgery
- ***Daya Upadhyay***, Assistant Professor of Medicine

Congratulations to this year's Faculty Fellows. We will be eager to benefit from their newly acquired leadership skills as new opportunities and challenges occur across the medical school and medical center.

Students Pursue University-Wide Smoking Ban

Promoting health is an important aspect of our mission. Lifestyle choices can impact the health of individuals and communities; as a consequence, wellness is an important facet of Stanford's mission (e.g., the Be-Well initiative) as well as a key component of the health care reform plans of local as well as national communities. Attention to diet and nutrition and exercise are vital parts of wellness. So too is avoiding exposure to drugs, toxins and products that can negatively impact health. Among these one of the most notable has been tobacco – leading us to ban smoking anywhere on the School of Medicine campus beginning September 2007 (see: http://deansnewsletter.stanford.edu/archive/07_30_07.html#c). More recently Stanford Hospital & Clinics and the Lucile Packard Children's Hospital have limited the areas available for smoking and, while this is a step in the right direction, it would be an important initiative for the entire Medical Center – and indeed the University – to be completely smoke-free. Thus it is gratifying to note that a group of undergraduate Stanford students are currently working on a university-wide ban on smoking and are gathering signatures from faculty, students and staff to accomplish that important goal.

Under the banner of Stanford Colleges Against Smoking, these students are carrying out a grassroots effort to encourage Stanford to become a smoke-free campus. If you wish to read – and sign – the petition they are circulating, you can do so at: <http://www.petitiononline.com/smokefre/petition.html>. Thanks.

Update on the Department of Pathology

On Friday January 16th, Dr Stephen J. Galli, MD, the Mary Hewitt Loveless, M.D Professor of Pathology and of Microbiology and Immunology, and Chair of the Department of Pathology, gave an update about his department to the Executive Committee. In addition to outlining the current state of the department, Dr. Galli described the changes in the department since his last such report in 2004, and outlined its current challenges and opportunities. I report the summary that he provided to me about his presentation:

Dr. Galli emphasized that, at Stanford, pathology is defined broadly as the branch of medicine concerned with the study of the nature of disease and its causes, processes, development, and consequences, as well as with the diagnosis of disease. As a result, the department includes many scientists who pursue basic or translational research projects related to disease pathogenesis; some of these are MDs trained in pathology but many others are not. The department also includes many world-renowned experts in various areas of pathology practice within anatomic and clinical pathology, as reflected, for example, in the fact that over 40% of the specimens examined in surgical pathology or hematopathology are referred to experts at Stanford from physicians outside of SUMC.

The mission of the department is: "To improve the diagnosis, treatment and basic understanding of human disease by clinical service, education and research." The department is committed to excellence in all of its mission areas, and believes that achieving such excellence requires that it also place a high value on diversity and inclusiveness. The last 5 years have been exciting ones in each of the department's mission areas. There have been many recognitions of the faculty's research contributions, including: The 2006 Nobel Prize in Physiology or Medicine (with Craig Mello) to Andy Fire (professor of pathology and genetics), the 2006 Thomas Laureate in Chemistry (with Stuart Schreiber) to Jerry Crabtree (professor of pathology and developmental biology), both the 2008 Koch Prize (with Shinya Yamanaka and Hans Scholer) and the 2009 Rosenstiel Brandeis Prize (with Shinya Yamanaka and John Gurdon) to Irv Weissman (professor of biology and developmental biology and Director of the SISCBRM), and the 2006 American Society of Investigative Pathology - Amgen Award for a young investigator in the broad field of pathology to Jon Pollack (associate professor of pathology).

In its educational mission, the strong performance of faculty in both medical and graduate education has been recognized by Kaiser Awards in Preclinical Teaching to Andy Connolly and Hannes Vogel, by Awards for Graduate Student Teaching to Joe Lipsick and Arend Sidow, and by an Immunology Program Faculty Mentor Award to Sara Michie. The department continues its strong focus on the quality of its postgraduate

training programs; in a survey of all 26 residency and clinical fellowship programs at SUMC, pathology was one of 3 programs rated by >70% of the residents as "excellent" and was the only program in which >70% of all residents and clinical fellows judged the programs to be "excellent".

In the area of Clinical Services, the department and School of Medicine, working with leaders of SHC and LPCH, reorganized the governance structure of the clinical service, as well as the leadership structure within the service, so that the chair of pathology and the Chief Operating Officers of SHC and LPCH constitute the Laboratory Governance Council (LGC), and the Medical Director of the SHC Clinical Laboratory and Anatomic Pathology Services, Dan Arber, has administrative authority, as well as clinical and administrative responsibility, for the clinical activities of the service, under the direction of the chair/service chief. The LGC recommended to the SHC Board the sale of SHC's basic laboratory outreach testing program, which provided testing services to clients outside of SUMC, but decided to retain and emphasize outreach services in areas in which we excel, such as surgical pathology, hematopathology, neuropathology and certain areas of esoteric testing. To enhance further services provided to LPCH, the department hired Kim Hazard, assistant professor of pathology and pediatrics, as Director of Pediatric Surgical Pathology, and Amy Heerema McKenney, clinical assistant professor of pathology, as Director of Perinatal Pathology; together with Sharon Geaghan, Co-Medical Director of the SHC Clinical Laboratory for Pediatrics, and Hannes Vogel, Director of Neuropathology, this brings to four the number of faculty with postgraduate training in Pediatric Pathology. The Stanford Blood Center continues to provide most of the blood products used at SHC and LPCH, and volumes of products provided have increased substantially over the last 5 years. However, the costs related to the operation of the Blood Center also have increased substantially.

The presentation ended with a discussion of progress in the area of personalized medicine and molecular genetic/genomic pathology, including the establishment, jointly with the Department of Genetics, of a research program to advance the methodology, basic and translational research uses, and clinical applications of ultra-high throughput sequencing (of normal or disease specimens, such as tumors). This program, which was initiated by Arend Sidow (associate professor of pathology and genetics), now includes many faculty and trainees in both departments. One of the objectives of this program is to position Stanford investigators favorably when the cost of re-sequencing an entire human genome drops to the range of \$1000. In addition, Iris Schrijver (associate professor of pathology) established in 2003 one of the first clinical fellowships in molecular genetic pathology in the USA. Steve recounted a number of key areas in the development of the field of molecular pathology in which Stanford has been first, and argued that we now have an outstanding opportunity to build on our historic and current strengths in this area, and to partner with the large group of faculty with interests in this area who are located in many departments and schools at Stanford, to make Stanford one of the leaders, if not "the" leader, in the field of molecular genetic/genomic medicine.

At the Executive Committee I also noted that in his presentation Dr. Galli had not mentioned any of his own scientific accomplishments – which have been notable in their own right – especially when coupled with his significant responsibilities as department

chair. I further noted that in my meetings with faculty, the Department of Pathology is frequently highlighted as one in which the career development and mentoring of junior faculty is given a very high priority and that the role of Dr. Galli in making this an important commitment is frequently observed. Thus, I want to thank Dr. Galli for important and effective leadership of the Department of Pathology and for his contributions as both a scholar and leader.

Emeritus Lecture Series

The School of Medicine Emeritus Lecture Series, which will be hosted by Dr. Ben Barres, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences, will take place on Thursday, January 22, from 4:15 – 5 pm, in the Clark Auditorium. U.J. McMahan, Professor of Neurobiology and of Structural Biology Emeritus, will give his farewell lecture on “A Life in the Shadows: What Electron Microscopy has Taught me About Synaptic Physiology”.

Awards and Honors

Four School of Medicine faculty members were recently named fellows of the American Association for the Advancement of Science (AAAS), an honor bestowed upon members of the association by their peers. They include:

- ***Dr. Peter Jackson***, associate professor of pathology, was elected for providing new insights into regulation of the cell cycle, the function of cyclins, protein degradation, and for the discovery of novel signaling mechanisms in the primary cilium.
- ***Dr. Theodore Jardetzky***, professor of structural biology, was elected for his research revealing the mechanisms of viral-host membrane fusion and important structural features of membrane receptors in the immune system.
- ***Dr. Robert Malenka***, the Nancy Friend Pritzker Professor in Psychiatry and Behavioral Sciences, and co-director of the Stanford Institute for Neuroinnovation and Translational Neurosciences (SINTN) was elected for his research on the cellular and molecular mechanisms underlying synaptic transmission, neuroplasticity, and drug actions, and their implications for normal and abnormal behavior.
- ***Dr. Irving Weissman***, professor of pathology and of developmental biology and the Virginia & D. K. Ludwig Professor and Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, was elected for his contributions to developmental biology focusing on cells that make up the blood forming and immune systems, and for the isolation and evolution of stem cells.

Appointments and Promotions

- **Thomas Clandinin** has been promoted to Associate Professor of Neurobiology, effective 1/01/09.
- **David A. Clark** has been promoted to Professor of Anesthesia at the Veterans Affairs Palo Alto Health Care System, effective 1/01/09.
- **Geoffrey C. Gurtner** has been promoted to Professor of Surgery at the Stanford University Medical Center, effective 1/01/09.
- **Neeraja Kambham** has been promoted to Associate Professor of Pathology at the Stanford University Medical Center, effective 1/01/09.
- **Carolyn Russo** has been appointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/01/09.
- **Minnie Sarwal** has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/01/09.
- **Karl G. Sylvester** has been promoted to Associate Professor of Surgery at the Stanford University Medical Center and of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 1/01/09.
- **Daniel Y. Sze** has been reappointed to Associate Professor of Radiology at the Stanford University Medical Center, effective 1/01/09.
- **Heather A. Wakelee** has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 1/01/09.

Dean's Newsletter

February 2, 2009

From the Budget Depths to Leading Matters

The Provost presented an update on the university budget at the January 22nd meeting of the University Faculty Senate. He provided an assessment of the impact of the global economic crisis on Stanford University overall – but also pointed out how these changes were affecting the different Schools. He began by reporting that the projected 2009 investment returns on the endowment are the worst in 45 years. The final results are of course not in for 2009, but currently the investment returns on Stanford's endowment are about negative 27%. This is of course a startling figure, albeit consistent with what is being seen at other universities and foundations. For reference, the worst prior year of investment returns was in 1974 at negative 8%.

For the University as a whole, investment income from endowment comprises 29% of our consolidated revenue. Other sources of revenue include grants and contracts (28%), tuition (16%), healthcare (11%), expendable gifts (7%) and other miscellaneous sources (9%). The relative distribution of these sources differs from school to school; this accounts, in part, for the variations across the university in how the downturn is being experienced and how decisions are being made to accommodate to reductions in revenue.

It should also be noted that the investment income from endowment is adjusted by a rolling three-year "smoothing formula." In practice this means that the endowment

income for FY09 (the current fiscal year) was fixed by the prior three-year smoothing; as a result, the impact of the downturn is minimal for this year. However, for FY10 the endowment income will be a negative 7.2% (assuming that the University endowment drops by the 25%). It could be worse or better in FY11 and beyond, depending on what happens to the American and global economies. For subsequent years, the investment returns will depend on whether the economic crisis improves or worsens. Of course, that means that our resources could decline even further.

It is also important to remember that investment income – which affects the University's General Fund Budget – is just one source of revenue and that all other sources are also being affected. That said, some of these negative projections could improve, depending on how well the stimulus package, recently approved in the US House of Representatives and now being considered in the Senate, works in reversing the economic downturn that continues through this writing. Increased federal support for science and technology should help, and it is encouraging that this is in the stimulus package. Other programs may also have an impact – but not all will be positive. And as I have pointed out in recent Newsletters, although our clinical income remains robust, this is also subject to change as job loss continues to increase, states cut back on entitlement programs (like Medi-Cal), and health care reform moves forward.

As you have likely heard, the Provost is taking steps to counter the projected significant reductions in the general funds budget. Most notably this includes a 15% reduction in allocated general funds over the next two years. This is an area that distinguishes the rest of the University from the School of Medicine. Since we are a “formula school,” general funds comprise far less of our overall revenue than most other Stanford schools – about 7%. We are much more dependent on sponsored research and clinical income. In addition, income from endowment comprises about 11% of our consolidated revenues – which is also far less than other schools. While we are thus less affected by reductions in general funds and endowment payout, the reductions we are witnessing are still very significant and have already resulted in a number of changes and policies that have been put into place since last Fall – with others to come in the weeks and months ahead.

That said, it is important to recognize that other schools at Stanford are already experiencing or projecting more dramatic declines in revenue than we are in the School of Medicine. Thus, if you read or hear about staff or programmatic reductions in one school at Stanford (as recently announced for the Graduate School of Business), you should not assume that the same approaches will be taken for the medical school – since our economic profile is quite different. However, it is safe to conclude that additional and significant cost cutting will be needed throughout the School of Medicine – especially if the global economic crisis continues unabated. Of course we all hope that the stimulus package will put the breaks on the economic downturn – and hopefully reverse the course.

Needless to say, all the grim news we have been receiving over the past many months (although now somewhat attenuated by the more positive results coming out of Washington during the past two weeks) can sometimes lead us to wonder if anything is

going in the right direction. That question was partially addressed for me by my participation in the Stanford “Leading Matters” program in Los Angeles on Saturday January 24th. I joined approximately 30 Stanford faculty for a very special event that attracted some 1500 alumni and guests for a program of lectures, seminars and discussion groups on a wide array of topics ranging from science to the arts to the environment, public policy and more. I was fortunate to facilitate a Frontiers of the Future dialogue on “Understanding Our Brain and Behavior” led by Carla Shatz, Professor of Biological Sciences and Neurobiology and Director of the BioX Program and Brain Wandell, the Isaac and Madeline Stein Family Professor and Chair of the Department of Psychology. We had the opportunity to give two sessions to standing-room-only crowds that engendered considerable interest and discussion. While I didn’t get to other sessions, I am sure they also presented compelling issues and evoked considerable interest. These academic sessions were accompanied by presentations from students in dialogue and in quite inspirational media productions.

In different but converging ways, the LA Leading Matters event reaffirmed for me why we do what we do. The optimism and talent of our students – across the University – together with the important initiatives being pursued by our faculty are more important than ever. Indeed, even though most of our days are now filled with concern and anxiety, the impact of Stanford’s programs in education, research and patient care – and the future leaders we produce – give hope despite the immediate challenges. And they reaffirm why we need to think and act boldly and ambitiously – to match the needs of the next generation and to use our talents to reshape our world.

It was helpful to go from discussion on budget to Leading Matters, which focused on what we are doing to improve the world we are living in – now and in the future.

Stem Cell Research Funding and CIRM

It is ironic. Over the past two years, as research funding from the NIH has declined, the California Institute of Regenerative Medicine (CIRM) has filled a vital and important niche. Not only has it been the major source of funding for stem cell research in the USA, it has also helped to provide important research funding at a time when NIH funding has fallen. Equally important, once CIRM overcame the legal challenges to its existence, in 2006, it has been a beacon of hope for stem cell research for the nation– training future leaders, moving the field forward and setting the foundations for the translational research programs that are anticipated over the next couple of years. The current momentum has been terrific – and Stanford faculty have played a key role, receiving more peer-reviewed competitive funding than any institution in California and creating a community of excellence that now extends across the university campus as well as to collaborators across the state, nation and world. There has been much to be optimistic and proud about.

How ironic then to witness a very serious potential setback to CIRM’s efforts. At the January 29-30th meeting of the Independent Citizen’s Oversight Committee (ICOC) – the Board that oversees CIRM and on which I have served since its inception in December

2004 – we learned that the \$40 billion budget deficit in California, along with the national economic crisis, has resulted in an inability to sell state bonds. In fact there is a very large number of unsold bonds – which include those already authorized for CIRM. Current projections are that this situation is unlikely to be resolved until the end of 2010. This has a number of consequences. As of January, 2009 CIRM has \$158 million in cash from past bond sales. Through June 2009, ongoing grant commitments and other expenditures will reduce this to \$39.2 million. But that is only part of the picture. With other ongoing grant commitments – some of which extend over multiple years – as well as operational costs, the minimal deficit at the end of December 2010 is projected to be \$133.6 million, assuming no further projects were approved, no new RFA's issued and a number of administrative cost containment actions were put into place.

The ICOC spent considerable time and debate in considering options. While the first priority must be to honor past, current and future approved commitments, an important question was whether to simply stop approving future awards and to not solicit new proposals. The ICOC was very cognizant of its fiduciary responsibility but also of the critical importance of CIRM in fostering stem cell research and in serving various constituencies – the public who voted for Proposition 71, the patients and families who are anticipating scientific and clinical progress through stem cell research; the students and trainees who will comprise the future research workforce; the faculty, scientists and research universities and institutions engaged in stem cell research and whose programs will be adversely impacted by a slow down or pause in funding; the biotechnology industry in California, which anticipates discovery and translational advances in stem cell research; government leaders in California and indeed across the nation; and our global scientific community. Even given the realities of the fiscal crisis in California in particular – as well as the events transpiring around the world – we still elected to do our best to find creative ways to move forward.

Given the problems in the current bond sale efforts, CIRM and the ICOC will pursue an alternative through “private placement.” This is an ambitious task with lots of challenges – but it is worth a serious effort. The basic mantra of the ICOC is that we have faced adversity before (which I can affirm is absolutely true) and that we have found ways to overcome major external challenges. We are committed to doing that again. With that spirit, we approved the Bridges to Stem Cell Research Proposals as well as the Training Grants II that had been reviewed and recommended by the Scientific and Medical Research Funding Working Group. We felt that the recommended proposals were highly worthy, and I am pleased to say that the Training Grant II proposal for Stanford scored highest in its category. However, because of the uncertainty about funding these grants are not being recommended for funding at this time – but that decision will be revisited in upcoming ICOC meetings when we hope that the budget situation in California will be clearer. We also elected to approve the RFA for the Disease Planning Awards with the same spirit of not wishing to lose momentum. Of course investigators applying for these grants will be informed of the current fiscal situation of the CIRM.

Clearly this news is disappointing – but we need to also acknowledge what we have accomplished to date in stem cell research, particularly through CIRM. Stanford remains

the top funded institution in California with just over \$100 million in grants, training awards and major facility support – including the Lorry Lokey Stem Cell Research Building/SIM1 that is now under construction. So, while there may be some setbacks, if history is any guide to the future, we will find a way to get back on track and continue this record of success.

Stanford Medicine North

On Friday, January 23rd Stanford Hospital & Clinics (SHC) hosted a reception in honor of the February opening of the Stanford Medicine Outpatient Clinics in Redwood City. It was an impressive event, largely because of the truly wonderful clinical facility that has been developed by SHC in Redwood City. As you likely know, this will be the clinical home for the Departments of Orthopaedics and Dermatology. It will also house the Pain and Sleep Programs as well as an Imaging Center and Ambulatory Surgery Center. In the future it will provide a home for a GI Endoscopy Center as well. The clinical facilities are outstanding and wonderfully appointed to give comfort to patients and to provide a highly functional and attractive facility for our faculty and staff. The major renovation of this facility has also been an excellent partnership between the leaders of SHC and School of Medicine – especially the cognizant department chairs and their faculty leaders, although the costs have been born by SHC.

It is notable that 50 years ago, Stanford Medical School and Medical Center became co-located on the Stanford campus – a geographic partnership that has shaped Stanford Medicine in remarkable ways. Now, fifty years later, we are reaching out to our neighboring communities to forge new relations that will support the needs of patients in the Bay Area and beyond. Another exciting chapter in the history of Stanford Medicine unfolds.

Connections Launched

On Thursday, January 22nd the Office of Academic Affairs launched a new program for newly appointed Assistant Professors and Clinical Assistant Professors called *Connections*. Led by Dr. Lucy Tompkins, Lucy Becker Professor of Medicine and of Microbiology and Immunology and also Associate Dean for Academic Affairs, the *Connections* program is designed to help junior faculty meet and network with other Stanford colleagues across departments and disciplines and to learn more about the medical school and the resources available to support career development at the departmental, school and university level. This will be accomplished by assigning groups of faculty to meet in small groups facilitated by a senior faculty member and designed to foster communication and mentoring. It is modeled in part on the highly successful Faculty Fellows Program led by Senior Associate Dean Hannah Valantine. *Connections* is being initiated to provide a resource for junior faculty to help foster and facilitate career development and satisfaction at Stanford. It is currently a pilot program but I certainly hope that it will prove successful and become another important feature of our efforts to improve the experience for junior faculty at Stanford.

UPDATE ON LANE LIBRARY

At the January 30th Executive Committee meeting, Heidi Heilemann, Associate Dean for Knowledge Management and Director, Lane Medical Library & Knowledge Management Center, provided an update on the progress on Lane's current strategic initiatives. These include:

- Developing a transparent *digital library* of knowledge sources and services available anytime, anywhere
- Creating *smart interfaces* and search tools that put knowledge in context at the point of care, research or learning
- Developing a *learning hub* that facilitates navigation and manipulation of knowledge content
- Designing flexible *library spaces* for students, trainees and instructors to collaborate, reflect, retreat
- Developing an *approach to research* innovative knowledge management tools and services

Her report on these initiatives follows:

Building a digital library

We now have over 98% of our current journals available electronically and 2844 of these titles are available online back to volume 1. Considering that the first electronic journal was not made available until 1995, this represents a significant effort of licensing with hundreds of publishers and providers in order to provide the Stanford University Medical Center seamless access to these important knowledge resources in biomedicine. Lane also provides access to over 5,800 eBook titles (up from 1 in 1996).

Considering the breadth of trusted content available together with steady traffic of over 3,000 visits to the LaneConnex website per day, one could make the argument that the Lane Digital Library is built and delivering valuable knowledge resources anytime, anywhere. The full potential of the digital library is just beginning to be tapped, however. The message I'd like to convey to all of our library users is: "begin to incorporate current knowledge management tool capabilities to improve your medical work ... we will work with you to make the tools more useful to your work." Think of Lane as your partner in not just locating knowledge resources, but putting them to work in ways that support and further your work.

Create smart interfaces

Building a digital library is not just about licensing lots of content. Once the content is acquired, libraries need to do what they've been doing for hundreds of years -- organize, maintain, preserve, and expose to targeted audiences. These targeted audiences are you and you are our co-developers.

In a climate of information overload, it is necessary to provide knowledge management support and smart integrated access to content through specialty portals and content experts. One of the outcomes of developing a generic clinical portal, for example, was the phenomenon of drinking from a fire hose of clinical information. To address this, Lane has developed a query mapping tool to connect users with the top three clinical

resources and has been partnering with our users to develop specialty portals to better integrate the knowledge resources at the point of need. One example of this is the inclusion of LaneConnex links in Epic and Cerner, Electronic Health Record systems for SHC and LPCH.

The LaneConnex Metasearch has been a tool for exposing other kinds of content as well, such as the recently released Bassett Collection of anatomical images. In honor of the School of Medicine's Centennial, a history portal was developed to highlight the school's history as well as Lane's rich historical collections.

Create a learning hub

Important feedback we heard during strategic planning focus sessions in 2004 was that there was no central place to discover learning, training, and workshop opportunities. A quick glance at our quarterly workshops schedule will show that we have been able to provide a dynamic and varied selection of workshop training and support. By partnering with OPA, SPCTRM, ODL, and others we have been able to cosponsor a number of training opportunities and provide access to content from these, including FAQs and multimedia training snippets that can be accessed 24/7 on LaneConnex. Lane liaisons and informationists provide a majority of the in person instruction, reaching 2300 participants each year. They are also available to do tailored sessions for departments and provide information literacy skills training in the medical school curriculum and residency training programs. Liaisons have also made themselves available to assist authors with compliance to the NIH Open Access Policy, which has provided an opportunity for further dialogue on important scholarly communications trends such as open access.

Re-envision the library as place

As print collections are moving out, Lane has been able to reclaim stack space for people. Working with the Student Advisory Committee, we have done a number of prototyping projects for optimal study spaces and will be a furniture test site for the Li Ka Shing Center for Learning and Knowledge in February.

Develop an approach to research for knowledge management

In transforming ourselves to a largely digital library, Lane has become a laboratory for knowledge management. A number of projects focused on saving our users time have centered on the overarching theme of connecting individuals with what they need when and where they need it. Highlights of these projects include the LaneConnex metasearch, the development of specialty portals, and a query mapping tool to connect users with the top 3 clinical resources. As we embark on our next wave of strategic planning, we are eager to evaluate these tools and build on new and existing partnerships with our users to develop additional knowledge management tools that will address needs of information literacy skills, personalization, data mining, and integrating knowledge resources into your workflow.

Thanks to Heidi Heilemann and all of her staff for the significant progress they have made in advancing their strategic initiatives. For more information about Lane, visit <http://lane.stanford.edu>.

Leadership Training in the Biosciences

In past Newsletters I have described a number of the Leadership programs that have been initiated in the School of Medicine and Medical Center (see: <http://deansnewsletter.stanford.edu/#3>) including one recently initiated by the medical student leadership (see: http://deansnewsletter.stanford.edu/archive/12_01_08.html#2). I am now pleased to report that this important trend in leadership training and development includes graduate students in the Biosciences. Of note, this past spring two Biosciences graduate students (Jessica Allen and Amy Radermacher, both Ph.D students in the Immunology Program and Executive Officers in BioMASS) initiated a course that offered the opportunity for Ph.D. students to build skills in leadership and effective communication that would be valuable in any career path. Twenty students were selected for this program through an application process. The selected students participated in weekly presentations and interactive discussions with invited experts from the Law School, the School of Medicine, the Center for Teaching and Learning, the Office of the Ombudsman, and the Center for Mediation and Communication. They focused on topics such as negotiation, mediation, how to handle difficult conversations and resolve conflicts, and how to effectively communicate science to scientific, lay, and media audiences.

This course complements the rigorous scientific training students get at Stanford and allows them to focus on specifically developing the leadership and interpersonal skills crucial in the diverse career paths that Stanford Ph.D. students choose after graduation. The pilot course proved to be very successful, and students reported clear improvements in their leadership skills at the end of the course. The course will be offered again this year with Dina Finan, a Ph.D. student in the Biochemistry Department, joining Amy and Jessica as course directors. Students who are interested in taking the course this year can find more information on the course website (<http://immunol240.stanford.edu/>).

I want to thank Amy Radermacher and Jessica Allen for their tremendous leadership in initiating this program – and also to welcome Dina Finan to this important initiative.

Continued Stellar Outcomes by Renal Transplant Team

Once again the Stanford Adult Kidney Transplant Team is leading the way. The clinical care program is led by Drs. John Scandling, Professor of Medicine, and Stephan Busque, Associate Professor of Surgery, who recently reported the results of the Scientific Registry of Transplant Recipients in which “Stanford is the only center in the nation to achieve statistically higher than expected results in both patient and graft survival at both one and three years after transplantation.” Such results reflect not only leadership but also enormous and dedicated contributions of doctors, trainees, nurses and all the members of the multidisciplinary staff. They also reflect the contributions of the diagnostic laboratories that evaluate and monitor these complex patients – including the

Histocompatibility, Immunogenetics and Disease Profiling Laboratory led by Dr. Dolly Tyan, Professor of Pathology, and her staff. I want to thank the clinical, administrative and support services that have achieved these results. Of course, the true beneficiaries are the patients who come to Stanford for their renal transplants. I also hope that these results serve as a clarion to other clinical services to seek and achieve comparable levels of quality and excellence.

Update from Health Research and Policy

At the January 30th Executive Committee, Dr. Phil Lavori, Professor and Chair of the department of Health and Research Policy, provided an update on HRP. I am pleased to provide Dr. Lavori's summary below:

The Department of Health Research and Policy is the union of 3 divisions, Epidemiology (6 primary UTL, 2 CE, 2 secondary UTL), Health Services Research (3 UTL), and Biostatistics (7 primary UTL, 4 secondary). Numerous courtesy appointments and shared enterprises with other departments demonstrate the collaborative stance of the department, as do its projections outside the University, to the Northern California Cancer Center (NCCC), Kaiser Division of Research, the Palo Alto VA, and the Palo Alto Medical Foundation Research Institute.

Research in the department ranges widely. Recently, Alice Whittemore, and Dee West (of the Epidemiology division), and their NCCC colleagues demonstrated an increased prevalence of BRCA1 mutation among US Hispanic breast cancer patients (particularly the 185delAG frameshift), possibly reflecting the Jewish Diaspora in Spain, and the genetic contribution of Spanish conquistadors of Ashkenazi Jewish ancestry to today's US Hispanics. This finding is relevant to cultural history, but also to diagnostic screening practices.

In HSR, Laurence Baker and his colleagues described the way that health care capacity influences utilization (especially in advanced imaging), often with little regard for effectiveness. Mark Hlatky has recently started a collaboration with Kaiser to develop a high-quality database of treatments and outcomes in heart disease, to investigate the effectiveness of interventions, develop methods for extracting such critical information from medical records, and (not least) better understand the strengths and limitations of such non-experimental research. As the US begins to confront the limits of its ability to deploy resources for health care, these and other initiatives may help guide decisions of momentous consequence.

In Biostatistics, Bradley Efron has developed a new method for dealing with the flood of data from modern high-throughput technologies, such as microarrays, whole genome scans, and proteomics, in which a few true positive findings are buried among false positive findings created from the play of chance on thousands of measurements. The 'local false discovery rate' estimates the proportion of observed findings that are true positives, as one dials up the threshold of strength of evidence, so that an investigator can pick the 'interesting' features for further test. Rob Tibshirani, Trevor Hastie, Efron, and colleagues in Statistics have developed a unified approach to the fundamental problem of regularization, by which an investigator with a classification problem based on a large number of features (and a paucity of data) can find the optimal balance between

overfitting and underfitting. These methods are basic to pharmacogenomics, gene-gene and gene-environment interactions in onset of disease, as well as response to medication, and modern diagnostic methods using '-omics' of all kinds. Mei-Chiung Shih and her colleagues (especially Tze L. Lai of Statistics) have developed new methods of clinical trial design that optimally re-evaluate how often to monitor for early stopping, as results accrue.

HRP plays a major role in medical school and post-graduate education of clinical researchers, especially by participating in the POM and by offering two masters degrees (in Epidemiology, with 26 current students, and Health Services Research, with 14). The Biostatistics faculty teaches and supervises students in the Statistics Department in H&S, which has one of the world's top-ranked programs, with over half the students interested in a Biostatistics specialization. HRP also contributes to several major SoM efforts, including programs and cores of the Cancer Center, the Clinical and Translational Sciences Award (Spectrum), and many PPGs, training grants, and career development awards in other departments. More than 1/3 of total HRP faculty salary comes from grants and projects administered by other departments, involving 92 non-HRP principal investigators in 44 divisions, departments, or institutes. The department also houses a small Data Coordinating Center (founded by Richard Olshen and led by Balasubramanian Narasimhan), which develops special purpose databases that are oriented to useful output, with particular attention to built-in tools for statistical analysis (the Biostatistics Console), and integration of clinical and basic science data. The DCC currently serves the Lymphoma Program Project, the Blood and Marrow Transplant Program Project, the Immune Tolerance Institute, and the Cancer Center, as well as several other programs.

The department has recently recruited 4 Assistant and one Associate Professor, rejuvenating our demographics, and building a sound base for the future. The disciplines we represent continue to be relevant to the goals of the School, and to the advancement of biomedical science worldwide.

Appointments and Promotions

- Juergen Willman has been appointed to Assistant Professor of Radiology, effective 2/01/09.
- Dolores Gallagher-Thompson has been reappointed to Professor (Research) of Psychiatry and Behavioral Sciences, effective 2/01/09.

Dean's Newsletter

February 17, 2009

The 2009 Strategic Planning Leadership Retreat

On February 6-7th nearly 100 leaders representing our faculty, staff, students and trainees, affiliated hospitals and university gathered for the Eight Annual Strategic Planning Leadership Retreat. This year we focused on the important issues of faculty development and career success. We decided to anchor the discussion at the department and division level since this is the site where faculty development begins and can be nurtured and sustained. We also elected to make this retreat more of a “bottom up” effort by engaging the attendees in an interactive process that identified key challenges and issues and then developed the first phase of planning activities that will be taken back to departments and divisions for further development and implementation in the months ahead. Major goals of the retreat were to build community interactions, foster cross-disciplinary dialogue, solicit creative and innovative ideas and recommendations and empower faculty, divisions and departments to engage in what we hope will be an ongoing cultural transformation.

To set the stage for the retreat and to place the issues we are facing into an historical as well as organizational context, I gave a presentation on “Creating a Culture That Fosters Faculty Development and Success.” My goal was to offer a context for addressing the issues we face today that takes into account our unique institutional culture. I am taking the liberty of providing an approximation of my remarks in the section that follows. Since the presentation was approximately an hour long, I must warn you in advance that the text is *long* (it may be easier to read on the web version – see:

<http://deansnewsletter.stanford.edu/>). But I think it offers details and observations that are important to consider. I recognize that these are filtered through my personal lens – but I think they provide a starting point for discussion.

Dean's Opening Presentation: Creating a Culture That Fosters Faculty Development and Success

Introduction

In January 2002, we came together at the Carmel Valley Ranch for our first Strategic Leadership Retreat. We accomplished two important goals at that event. First, we built on the work of developing our strategic plan, “Translating Discoveries,” that had begun prior to the retreat. Second, and perhaps even more important, we had the opportunity to better understand the different but important roles we play as leaders in basic science, clinical science and patient care. What was then a somewhat divided leadership left the retreat more aligned and united – something we have strived to build on in the ensuing years.

In the subsequent seven years we have made major strides in a number of mission critical areas. But we also face significant challenges –driven in part by the dramatic changes that have occurred in our nation's and the global economy as well as by the diminished level of support for science and technology that has characterized the past 8 years. We

also face many uncertainties as we go forward – which makes it ever more important for our community to be aligned and unified in our commitment to the future. Whatever the changes in funding for research, or the consequences of health care reform, or the changing economic forces at Stanford and in the Bay Area may be, we need to chart our course and define our future destiny. That is our responsibility as the current stewards and leaders of Stanford Medicine

But we are a diverse community comprised of a wide range of individuals with quite different needs and expectations. These are not always aligned, and this misalignment creates additional tensions and underscores the importance of defining our mission in as inclusive a way as possible. Specifically, our community includes (many of whom are represented at this retreat):

- MD and PhD students
- Residents
- Postdocs
- Clinical fellows
- Junior, mid-career and senior faculty
- Basic science faculty (UTL, NTL)
- Clinical research faculty (UTL, NTL and MCL)
- Clinical care faculty (CE)
- Medical School faculty administrators – division chiefs, department chairs, deans
- University faculty and administrative leaders – deans, provost, president
- Board of Trustee members
- Administrative and support staff
- Hospital administrative leaders
- Hospital Board members

Members of each of these groups have different goals and expectations, both for their own careers and for how their needs and expectations intersect with others, positively and negatively. The reality is that the current composition of an academic medical center, coupled with its internal pressures and culture and the multiplicity of external forces acting on it, fosters tensions and pulls, which are felt at the individual level and which, when unaddressed or unacknowledged, can lead to significant anxiety and negative career satisfaction – at all levels and stages of career development.

We are also a decentralized organization, and much of the responsibility and accountability for career development resides at the department or division level. The department is also the place where transformation can occur– including the cultural transformation necessary to make Stanford the best institution it can be for the 21st century. That said, cultural change also occurs – and indeed must occur – at the individual level, and as noted earlier, we are comprised of individuals with significantly variegated goals and objectives.

This year we want to focus our efforts at this retreat on career development and the degree of satisfaction our faculty experience in pursuing their careers at Stanford. Of course all faculty members have individual stories and sets of circumstances– regardless

of whether they are new or long-term members of the community and irrespective of career stage. Each has needs and expectations that are the result of who they are, the nature of their work, the culture of our institution and a panoply of external and internal forces. We can learn how our faculty are doing by sampling them at a point in time. But we can also learn by being cognizant of the institutional culture that has evolved at Stanford and the role it plays in setting expectations for success and in delineating who wishes to be part of our community.

This retreat is faculty-focused, but the culture that we will be considering involves everyone, and we welcome everyone's active participation.

For this retreat we will follow a different format than we have in past gatherings. We will be working with Co-Vision, a company led by Lenny Lind. Co-Vision has pioneered "fast feedback" technology. Since 1991 they have supported over 3800 conferences, including the General Session of the 2005 World Economic Forum in Davos and the Clinton Global Initiative Meetings, among many others. I also want to thank **Julie Moseley, Hannah Valantine, Kathy Gillam, Christopher Gerlach and David O'Brien** for the work they have put into organizing this retreat. In addition, I want to thank our several chairs who played an important role in helping to gather insights from our faculty: **Jim Ferrell, Steve Galli, Ralph Horwitz, Karla Kirkegaard and Al Lane**. And I want to thank **Kristin Goldthorpe and Mira Engel** for their work in supporting the Retreat.

We will provide a document at the end of the retreat that contains the outcomes of our discussions. These will take the form of nine specific action plans designed to address specific issues of departmental culture having to do with faculty development and career satisfaction. Most importantly, we will ask those of you who are department chairs to take these plans back to your departments and, in coordination with your division chiefs, review them with your faculty. Each department or division will choose one of these plans to develop further and implement. Over the course of the year each of you will present the results of your efforts to the Executive Committee. Thus, this retreat will set the stage for the important work that will happen at the division and department level over the next year and beyond. When we conclude tomorrow it will just be the end of the beginning.

To set the stage for the work we will do together this afternoon and tomorrow morning, I want to provide some summary comments from our colleagues about how they view their career development in the medical school. Of course, their reflections (both positive and negative) represent their personal perspectives, which are individual and highly varied. But they also reflect some common themes. Many of these themes emerged decades ago and have endured to the present moment. They are shaped by our institutional culture and how it has responded to both internal and external forces over the years. In many ways our history has predicted our current environment. But at this crucial moment our future depends on how – or whether – we change our culture – both as individuals and as an institution to adapt to our rapidly changing world.

What We Know About How Our Current Faculty Feel About Their Career Development and Satisfaction.

We have used several sources of information to assess what our faculty think, including:

- In anticipation of this retreat, we conducted a survey that attempted to assess perceptions and feelings about career support, satisfaction and success at Stanford. This survey had a response rate of 47%, or 559 respondents, who included UTL, NTL, MCL, and CE faculty. While this response rate is less than desired, it is still more substantial than many other surveys.
- The AAMC/COACHE Survey that was conducted in 2007 (I have written about this survey in previous Dean's Newsletters http://deansnewsletter.stanford.edu/archive/01_28_08.html#2). In this survey we served as a pilot institution, and our faculty were compared to faculty at nine other medical schools, three of which (UCSF, Penn, UCSD), served as peer comparators. Since this survey had a response rate of just 38%, we want to be cautious about interpreting the results. It is best to look at them as trend data.
- During the summer of 2008 Hannah Valentine and I met with virtually all junior women faculty. We did so in groups of 4-6 individuals and engaged in a candid dialogue about the institutional culture and forces that either promote or impede individual career development and job satisfaction. Dr. Valentine and I are now meeting in small groups with all junior men faculty.

These three approaches were independent of each other, but their outcomes revealed some common themes that we might use to consider ways we might improve the future success and satisfaction for our faculty.

Pre-Retreat Survey

Some important messages emerge from these data. For instance, overall, **85%** of respondents indicated that they would like to sustain their career at Stanford University. **75%** indicated that they were satisfied with their career and 8% were neutral – leaving **16%** who were dissatisfied. On the surface, then, most of our faculty appear to be satisfied – but since we want to foster the career development and, ideally, the job satisfaction of each member of our community, it is important to drill further into these data.

An important set of questions concerns how faculty members perceive the value their departments and divisions place on the research, teaching and clinical care missions, the clarity of the expectations around these missions, and the congruence of their own expectations with those of their departments/divisions. For instance, we commonly refer to Stanford as a research university and to our school as a research-intensive school of medicine. There is little doubt about this in the minds of our faculty, for whom **82-89%** recognize that their departments/divisions place a high value on research. In addition, **79%** of respondents (excluding Clinician Educators, whose response was lower) feel their departments/divisions' expectations regarding research are clear.

The results were similar for the clinical care mission; **82%** responded that their departments/divisions place a high value on this mission, and **85%** feel that the expectations for clinical care are clear. The teaching mission showed a similar alignment of value and expectations; however, teaching is less articulated as a value, and the expectations are less clear: only **65%** responded that their departments/divisions place a high value on teaching, while **71%** feel that the expectations regarding teaching are clear. Overall, **68%** of respondents said that the expectations of their department/divisions for their performance were congruent with their own.

At the same time many faculty do not feel well supported in their work. In fact, only **51%** of the respondents see their department as supportive, and less than half (**48%**) receives what they feel to be valuable career advice from their chair or chief. That said, **60-70%** feel that they can go to their chair or chief for career advice. **61%** feel that they will get feedback from their chair or chief, and **70%** believe their chair/chief would inform them if they were having problems. Interestingly, more than **90%** of the respondents attribute their success to their own personal drive and talent. About **75%** believe that colleagues at Stanford or elsewhere have been helpful to career development. But **less than 50%** have mentors at Stanford or elsewhere.

About 63% of the respondents feel that the demands of their career impact negatively on their personal life. Moreover, only **46%** feel that they can discuss these concerns with their chair or chief. Overall, basic science faculty are more satisfied than clinical faculty and feel that they are more supported and more aligned to the missions of the school and their department than their clinical colleagues. Moreover, overall, women are less satisfied than men. They feel less aligned to the expectations of the department and appear less likely to have a defined career plan. Women feel less supported by their chair or chief, feel they get less feedback and are less likely to seek guidance from their chief. Women also feel more connected to the clinical missions and less to the research mission than men.

Clinician Educators (who are over-represented by women) appear to be the most disenfranchised group of faculty at this time. They are less clear about the expectations of their department than other faculty groups and are less likely to have clearly defined career plan. They also feel less clear about support from their department, chair or chief.

Finally, it is interesting to note what respondents identified as their sources for greatest joy in being at Stanford (in alphabetical order). They include:

- Collaboration – including interdisciplinary and cross campus opportunities
- Colleagues
- Culture and environment of one's department
- Patient care and clinical excellence
- Research
- Students and teaching
- The Stanford reputation

Similarly, respondents were asked to identify areas of frustration in their Stanford career. The responses included:

- Lack of support from school and department leaders
- Perceived inequities between different categories of fellows and faculty – clinical versus basic, men versus women
- Lack of resources to support career development –different reasons for basic and clinical faculty
- The pressures and expectations surrounding clinical care, including the support that comes from the two teaching hospitals - along with the perception that too little value is place on clinical excellence.

AAMC/COACHE Survey Data

It is important to add both some comparative texture as well as individual granularity to these data. While the COACHE survey had a lower response rate (38%), it is interesting to compare those elements in which our Stanford faculty felt more – or less – satisfied than their peers at Penn, UCSF and UCSD. These include the following:

Stanford Faculty rated 25 items significantly *higher* than faculty at peer institutions:

- ***Satisfaction with:***
 - Incentive compensation, such as bonuses
 - Housing benefits
 - Tuition benefits for dependents
 - Spousal/partner hiring assistance
 - Parental leave policies
 - Availability of childcare offered by the medical school
 - Quality of childcare offered by the medical school
 - Institutional assistance in finding offsite childcare
 - Communication from the Dean’s Office to faculty about the medical school
 - The Dean’s priorities for the medical school
 - The pace of decision-making in the Dean’s Office
 - Opportunities for faculty participation in governance of one’s department
 - Communication from one’s Department Chair to the faculty about the department
 - The Department Chair’s priorities for the department
 - How well the location of one’s clinical practice functions overall
 - The medical school as a place to work
- ***Agreement that:***
 - One’s work is appreciated by one’s patients
 - One’s work is appreciated by the Dean’s Office
 - The workplace culture of the medical school cultivates interdisciplinary work
 - The workplace culture of the medical school cultivates entrepreneurialism
 - The workplace culture of the medical school cultivates excellence

- The medical school is successful in retaining high quality faculty members.
- One's department does a good job explaining its overall financial situation to the faculty
- One's department does a good job explaining departmental finances to the faculty.

In contrast Stanford faculty rated 12 items significantly *lower* than faculty at peer institutions:

- *Agreement that:*
 - One's work is appreciated by one's immediate supervisor
 - The requirements for teaching/education are clear
 - The requirements of institutional service are clear
 - The requirements for institutional service are reasonable
 - The criteria for promotion are consistently applied to faculty across comparable positions.

Ethnographic Observations

It is also informative to reflect on the individual stories and concerns Dr. Valantine and I have heard directly from faculty – both in our meetings with junior faculty and more broadly. Without being simplistic, success and satisfaction ultimately comes down to the individual's expectations, career track choices, the level of support received in the division or department and the support received from faculty colleagues and institutional leaders. Of course personal pressures and challenges can dramatically alter the equation; these may include personal resources, spousal and partner relations, age and well being of children, impact of eldercare and the multiplicity of other factors that impact the lives of individuals at different stages of their career.

While it is important to focus on the concerns that are raised and reported, it is even more important that we do not approach our work by simply highlighting the negatives or complaints. Every job has stresses – and those in medicine and science are hardly exceptions. But I think we are better served by taking note of what does work and then thinking about ways of making those successful ventures the focus of our institutional culture.

In sum, these data affirm that, while we are all part of a common culture with widely recognized norms and expectations, we are also comprised of a variety of constituencies that have varying degrees of satisfaction, clarity, perceived support, and degree of connection to the school's missions. Some of these differences are related to individual perceptions, but many emanate from the Stanford culture – or the “Stanford Way” – that has evolved over the past decades. It is notable, for instance, that some of the areas of dissatisfaction are also congruent with our history and with the culture that has developed at Stanford Medicine over the past 50 years – especially the tensions between the value placed on research versus teaching and patient care.

How Our Unique History and Culture Have Shaped Who We Are Today

Evolution of the “Stanford Way”

To a great degree the perceptions and views of our faculty colleagues today are products of our history and of the Stanford culture – sometimes referred to as the Stanford Way – that has evolved over the past 50 years, since the School of Medicine moved to the Palo Alto campus. Taking a moment to look back to the re-founding of Stanford Medical School in 1959 and to reflect on the forces that have shaped the school as a whole and the individuals who have been part of its community affords an opportunity to better understand some of its current and future challenges and opportunities.

The move of the medical school in 1959 was the fulfillment of the vision of key institutional leaders at Stanford who believed that the second half of the 20th century would offer opportunities in science and medicine that would benefit from the location of the medical school with the rest of the university. Most notable were President Wallace Sterling and Provost Fred Terman. Several key medical school faculty members also played a critical role, including Drs. Robert Alway (Dean during the transition), Henry Kaplan (who helped found the field of radiation oncology and whose research still stands as a paradigm of interdisciplinary investigation and innovation), and Avrum Goldstein (in pharmacology), among others.

These university and medical school leaders and others created a unique environment that continues to define us to the present moment. Its key elements included:

- A physical continuity between the basic and clinical sciences
- A co-location of the medical school to its major teaching hospitals
- A close proximity of the medical school to the university and especially to engineering and the biological and physical sciences.
- An entrepreneurial spirit that is committed to innovation and discovery
- A willingness to engage in interdisciplinary and multidisciplinary research

These factors and of course the individuals who came to Stanford as faculty, students and staff shaped the medical school agenda with a unique focus that has a number of characteristics, such as:

- Research, along with a commitment to scholarship, has been the defining value throughout these 50 years, and it continues to permeate the culture of both the medical school and rest of the university
- The focus has been on the accomplishments of individuals
- Recruitment of faculty is through national searches and an emphasis on recruiting individuals from outside Stanford (especially in the basic sciences)
- Placing a high value on being small and outstanding – this has defined the size of the faculty across the university, and it has had notable implications for the medical school, especially in limiting the size of the faculty through a billet cap

In the area of medical education, the initial focus was on training individuals who would pursue careers in science and academic medicine. The Five Year Plan was

initiated as part of the relocation to Palo Alto. It evolved over the years to a “flexible curriculum” – which nearly became a non-curriculum. The next major reform did not occur until 2003, when the current “New Stanford Curriculum” was launched.

The commitment to clinical medicine has an uneven history. Initially the hospital was divided into a “community hospital” and a “university hospital.” Faculty cared for less than a third of the patients admitted to Stanford Hospital, in line with the initial understanding that community physicians would provide general medical care and faculty would focus on patient care in relation to their teaching and research missions.

For the first three decades following the move, all faculty were in two different lines, the University Tenure Line or the Non-tenure Line (Research, Teaching or Clinical). Recognition of the importance of a separate faculty line for individuals involved primarily in patient care did not occur until 1989, when the Medical Center Line (MCL) was created. The size of this line was driven largely by “business plans.” It grew significantly through the 1990’s, in contrast to the number of faculty in the other lines throughout the university, and was uncapped until 2004. In the School of Medicine there are now more MCL than UTL faculty (there are a very small number of Non-tenure- Line faculty in the School).

From its inception MCL faculty have been considered members of the University’s professoriate, (with various perceptions about what this meant), but they are not members of the “Academic Council,” which consists of Tenure Line and Non-Tenure-Line faculty. As a result, they were initially not eligible to serve on a regular basis as Principal Investigators (PIs), a role generally restricted to Academic Council members. In 2003, University policy was revised to include MCL as PI-eligible faculty. Nevertheless, for much of the first 15 years of the existence of the MCL, faculty in this line have felt second class – something which has improved, but which, unfortunately, has not disappeared.

In 2002 the School initiated the Clinician-Educator (CE) Line. Initial appointments to this line were of individuals already at Stanford as Staff Physicians. Our goal was to redefine the staff physician role by, among other things, laying out a career track for individuals whose focus was on providing the highest quality clinical care in an academic medical environment. At the same time we revised the titles and roles of the community physicians serving as Adjunct Clinical Faculty.

Our hope in establishing the CE Line was that individuals serving in these ranks would become valued members of the medical school community and would provide important knowledge and skills. However, many of our CE faculty feel that they are “second class” – that they are not valued in their departments or in the school and university. In many ways, these perceptions reflect a wider view about how clinical medicine is valued at Stanford University. While there is no question about the value of research, there is wide variation in the value that has been placed on clinical care – and on being an outstanding clinician. While this attitude has evolved over the years and has clearly been changing

over the past decade, the perception that clinical care is valued less than research is still widely shared, and it does have a basis in fact.

This disparity in value is the counterpoint to what makes Stanford so strong as a research university. The culture and values of the university are in scholarship and discovery. While excellence in clinical care is valued, many in the university see this as part of being a good doctor – and they do not see the relevance of excellence in this domain to being a scholar or innovator *per se*. Moreover, the appointments and promotions process is largely oriented to scholarship and until recently has not put a premium on excellence in patient care (or even education). Department chairs and faculty themselves value the role of Clinician Educator differentially across the school. All of these factors inevitably have a negative and disheartening impact on how CEs perceive their value and role. Our goal is to give equal value to all faculty lines and all the roles they play – they are all equally critical to our success.

External Factors Impacting Academic Medicine During the Past Five Decades

In Clinical Care

A number of external factors have also shaped the evolution and development of Stanford Medical Center during the past 50 years. For instance, 1959, the year the medical school moved to the Stanford campus, was a time of national prosperity. Unfortunately, development of a national health program had not been addressed as a part of the New Deal in the 1940s, and attempts to accomplish such a program had failed during the Truman administration – largely because of lobbying by the AMA. Medicare and Medicaid were established in 1965 and resulted in the expansion of academic medical centers across the nation. In fact academic centers have grown from less than 20,000 full-time faculty in the early 1970's to approximately 125,000 in 2007. This represents a four-fold increase in basic science faculty and a fourteen-fold increment in clinical faculty. Further, the social upheaval that occurred during the 1960s and 1970s changed the medical student culture and shifted the focus (to varying degrees) from the research focus of the Five Year Plan to more flexibility and an orientation to primary care medicine.

The conversion of traditional fee for service to managed care began in the late 1980s and early 1990s and had notable consequences, first in the Bay Area and then across the nation. In California and especially the Bay Area, a number of HMO and non-academic medical systems began a process of consolidation. Most notable among these were Kaiser and Sutter. Capitated health care began in the 1990's and while academic centers, including Stanford, were initially engaged, this did not play to their strengths. Also in the 1990's a number of academic centers, including Stanford, became increasingly competitive with community physicians or community hospitals. Several approaches were taken to address this – primarily by forming regional networks and systems. However, Stanford elected not to foster a relationship with a regional physician group – the Palo Alto Medical Foundation (PAMF). At that time PAMF, which was in need of cash for facilities, was eager to be assimilated into Stanford. When that failed, PAMF joined Sutter. This has had enduring consequences.

As competition increased in the 1990's and the tensions between payers (largely insurance companies but also Medicare) and providers became more acute, academic medical centers took several approaches— some of which succeeded and many of which failed. One was to develop regional networks by purchasing community physician practices and/or community hospitals to create systems that would impact negotiations with payers. The University of Pennsylvania drove this model – and nearly collapsed as a consequence. Stanford (particularly SHC) bought a few practices, but they were not successfully managed and were divested in 2001.

At about this time mergers among academic medical centers began; these have had varying successes and failures. The most notable success is Partners Healthcare in Boston – in part because it was never a merger – but also because it created incredible market clout in Massachusetts (although this is now being challenged by the state government). The most notable failure was UCSF-Stanford, partly because of how it was conceived, managed and executed, but also because of the significant cultural differences between the two member institutions and the lack of buy-in by clinical leaders. When these mergers or consolidations worked they have had significant financial benefits. In California, Kaiser and Sutter (with PAMF) continue to succeed. In Massachusetts, Partners has been a major institutional success. On the other hand, when they have failed, there have been major negative financial impacts. The Mt Sinai-NYU attempted merger was a major loss. Similarly, the merger between Brown and Tufts failed significantly. The CareGroup merger, which is now succeeding, nearly led to the collapse of two premier hospitals. The Stanford-UCSF merger had major negative financial consequences for both institutions – and also for individuals.

In Research

Just as clinical programs expanded and grew in academic medical center following the initiation of Medicare and Medicaid, so did research – largely because of its support from the National Institutes of Health. From the 1950's through 2003, basic and clinical research increased in academic medical centers. That said, successful funding and academic program development were concentrated in “research intensive” schools. Still, most medical schools were able to continue to expand research programs and facilities through this period in tandem with funding support from the NIH and key foundations. Even though the competition for research has had periods where funding has become extremely competitive, until 2003-2004 it had mostly kept pace with biomedical research inflation.

The period of 1998-2003 was the doubling of the NIH budget from \$13 to \$26 billion. Many medical centers assumed that this funding would continue indefinitely and expanded research faculty and new facilities. Stanford was not among these. Since 2003 the NIH budget has been essentially flat – which means that it has lost 13% of its purchasing power compared to 2003. The flat budget was initially the consequence of limitations of discretionary federal dollars along with a loss of confidence in the NIH from the Congress and a broader anti-science movement in Washington DC and beyond. The duration of this NIH budgetary decline is unprecedented and is now putting enormous pressure on faculty (as well as students) who are competing for shrinking pie

of dollars. At the same time, a portion of the NIH budget has been redirected to translational and clinical research as well as to “big science.” As a result, reductions in support for graduate students and for RO1 research (which has been Stanford’s forte) have taken place during the past 5 years.

The Present Moment: Impact of the Present Economic Downturn

The major forces now shaping medicine and science at both the institutional and individual levels are economic. These took a distinct turn for the worse in December 2007 and, as is well known to everyone, the global events and worsening recession of the past year have had unprecedented negative impacts. Many factors are involved – some of which have already affected our situation and many others of which are likely to unfold. These are challenging the fundamental organizational model of academic medical centers and universities and include the impact of the downturn on endowment and financial reserves. The University and the Medical School (as well as the hospitals) have already lost about 25% of the value of endowment investments. The downturn has also impacted not-for-profit foundations that provide support for research, in some cases at an even higher percentage loss than Stanford’s, which means that funding for research from foundations has and will continue to decline. When coupled with the loss of research dollars from the NIH, NSF and other federal programs, this additional loss of research support is serious, and the situation is still deteriorating. Overall Stanford had a decline in research support in 2008 – although the level of NIH support is up in the first quarter of 2009.

An exception to this trend is funding from the California Institute for Regenerative Medicine (CIRM). Stanford has competed very successfully for both programmatic and capital funding from this organization. But given the state of both the California economy and the bond market, it is uncertain how this program will be affected over the next years. (And the funding could potentially run out in 2014 unless the citizens of California vote in a new bond.) Gifts, which traditionally support research, education, faculty and facilities, are also now challenged with the global economic downturn. Clinical revenues are still meeting budget, but these are also threatened. As the economy worsens, discretionary care will be postponed, which will affect some clinical services more than others. In addition, as citizens lose jobs and, as a result, medical insurance, or as small businesses reduce their insurance coverage for employees, individuals will seek less medical care. At some point the numbers of uninsured patients will increase.

The entitlement programs are also challenged. The Medicare Trust Fund needs attention (it goes bankrupt in 2017), and there will be a great deal of pressure to address this program, which on a national level covers more than 40% of medical care costs – although this is closer to 25% at Stanford. But Graduate Medical Education (GME) support is embedded in Medicare, and, when reform occurs, it is likely that GME will be affected – which will have enormous consequences for all academic medical centers, including Stanford. Medicaid (in California this is Medi-Cal) is already a very poor payer, especially for physician services. Our state has the second lowest Medicaid (Medi-Cal) reimbursement in the nation. The major impact of this rate is on pediatric care, and

the most serious consequence of the economic downturn for us is an increase in the percentage of Medi-Cal patients seeking care.

Overall, then, there are a number of serious risks to the current integrity of the university, medical school (as a formula school) and major affiliated hospitals. Within this context, the next months and year will witness a number of new policies and programs designed to address past and current problems – some of these can and will help our community and the nation, while others will pose new challenges. Prominent among these is the Obama stimulus package, which may provide some relief for research programs. It seems clearest that this will be the case for research in energy and the environment. But a compelling case is being made for biomedical research, which might at least allow the NIH budget to keep pace with inflation, hopefully after an adjustment that makes up for the serious losses of the past several years. *(In fact, in the days following the retreat, the approved “Stimulus Plan” ended up with \$10 billion of incremental funding to the NIH, thanks largely to the efforts of Senator Arlen Specter – which is great news, but which carries some additional challenges that I will discuss in a future Newsletter.)*

Some health care reform seems likely – which is good news. But the way this unfolds could affect support for academic medical centers. The likely focus will be on improved health management rather than disease management. The payment system will likely be focused on quality outcomes. There will probably be greater oversight over technology and how it is employed. There may be adjustments to the payment schedules for primary care versus specialty or procedure- based specialties. Addressing medical workforce issues will involve developing new roles for physicians and other health professionals and may change the current roles, especially for primary care providers. So, the stimulus package has the potential to either improve or potentially worsen the various elements of our institutional financial picture noted above (investment returns, fundraising, federal and state support, etc).

Demographic Contrasts Between 1959 and 2009

In addition to the significant institutional changes that have occurred over the past 50 years, there have been very significant individual shifts that affect career development and overall career satisfaction – and that also impact the culture of institutions, which, in turn, of course, are ultimately created by the individuals who work in them. For example, in 1959, when the medical school moved to the Stanford campus, women comprised a very small percentage of the medical school and graduate school classes. This has changed dramatically during the past several decades, with women now comprising more than 50% of incoming classes.

Career development, success and satisfaction appear to be different for women versus men, especially for clinical faculty. This is the result of multiple factors, including differences in the styles, expectations and culture of women versus men and the impact and timing of family. A high percentage of women (not only in medicine) begin their family in their 30s – at the time when the pressures for career development are most notable. Many more families are now dual career, with both spouses working full-time.

This is not only a consequence of a desire for career satisfaction. It has also been economically driven – something likely to continue or worsen in the years ahead.

Since 1959 longevity has increased, and the expectations of faculty to continue their careers into their 70's and beyond has increased. Based on a 2007 survey of all School of Medicine faculty age 50 and older, approximately a third of faculty over 50 years – and continuing for each age cohort thereafter – have done little to no financial planning and have little sense of what it would take to retire – or when to do so. This issue is likely to become even more serious with the current economic downturn, since virtually everyone has seen a significant decline in his or her investments, retirement plans and savings. However, faculty continue to work not only for financial reasons – but more so because of their commitment and interest in their research or professional life.

Since 1959 the professional life of faculty in academic medical centers has changed enormously due to external forces impacting medical schools, teaching hospitals and academic medical centers. For example, expectations for clinical performance for faculty have increased and are accompanied by metrics for volume, clinical activity, quality and service. These expectations create a nearly constant tension for clinical faculty regarding what they need to do to be clinically successful (and earn their salary) as well as academically successful. The lack of time is a constant pressure. In addition, the competition for grant support has increased – especially in recent years – and is impacting all research faculty, all of whom spend an increasing amount of time writing proposals in order to support their lab or research program.

This problem is further aggravated by the financial model of medical schools in the United States, which are based largely on “soft money” from clinical income and grants to support salary and programs. This puts the onus on the individual faculty member and makes it difficult for individuals to spend time doing things that do not generate revenue – such as teaching, mentoring, or reviewing the grant applications or publications of junior faculty and students. The tension extends to the expectations for clinical faculty by teaching hospitals and their administration balanced against the expectations of their department leaders, the promotion process, etc. The pressures on virtually everyone have increased.

Medical schools and universities still put the greatest focus on the individual and his or her success and place less value on the contributions of teams, and there is little inclination to encourage, or even permit, faculty (including clinical faculty) to work part-time or to job share. In contrast, over the past decades there has been a shift in the expectations and desires of individuals entering medical or graduate school in how they see their future and what is likely to provide career success and satisfaction. A higher premium is now placed on work-family balance (by men and women). For medical school graduates, career paths that allow for more work/life balance have become more desirable and competitive and attract the most talented individuals. The orientation has been away from primary care specialties (including general surgery) and more toward specialty areas – particularly dermatology, radiology, radiation oncology, anesthesia and surgical subspecialties. Some, but not all, of this is driven by student debt – which is a

real factor. Of note, Stanford has among the lowest levels of student debt for medical students in the nation.

The length of training has also increased and has become a limiting factor. Limits on the amount of time residents can work set different expectations than in previous generations of physicians. For those who go into clinical practice, the expectation now is that they will work in a group practice/HMO or staff model and receive a salary. They also expect that they will be able to job share and have time off for personal interests. These goals carry over to expectations for work-life balance in academic medicine. For graduate students, there is an increased interest in pursuing careers outside of academia. Currently at Stanford about 50% of PhDs pursue academic careers. But with the current economic conditions, opportunities in academia will decrease. Furthermore, a recent survey of PhD students in the University of California system found that a significant majority of this group does not envision careers in academic medicine as friendly to work-family balance. This, along with many other factors, means that we need to train PhDs for multiple career pathways and opportunities.

Some of Our Accomplishments During the Past Eight Years

Many institutions respond to these internal and external pressures in a reactive way. Others work proactively to establish their goals and expectations so that they can better chart their future directions based on internal planning as well as the ever-changing external forces.

During the past 8 years we have tried to take the latter approach by establishing an institutional agenda that permits us to chart our own desired direction rather than to simply reacting to a direction imposed by others. Obviously adjustments must sometimes be made in such planning activities due to unintended consequences to internal constituencies or in response to anticipated –or unanticipated – external forces. As you all know, the degree and severity of the current economic down turn was not predicted – nor can we predict how and when things will improve. This uncertainty makes current and future planning even more important since, in its absence, we could end up a very different institution at the end of this period than we wish or expect to be.

A number of the plans and strategic goals set by faculty, students and staff over the past 8 years have contributed to our institutional as well individual success. They have helped re-define the medical school, and they contribute to how we are viewed in the other schools at Stanford, across the nation and around the world. Among these are:

- ***Education***
 - The New Stanford Medical Education Curriculum
 - Improved support for graduate student tuition and education
 - The Masters in Medicine Program for PhD students
 - The Advanced Residency at Stanford Program for clinical fellows
- ***Research***

- Supporting faculty and opportunities for basic science research – including support for recruitment and related resources
- Success in achieving a CTSA
- Success in becoming an NCI-designated research center
- Provision of seed grants through the Institutes and other institutional programs that foster innovative and collaborative research
- ***Patient care***
 - Coordinated strategic and programmatic planning with both SHC and LPCH
 - Improvement in the financial support for clinical faculty (to date with SHC and pending with LPCH)
 - Significant improvements in quality performance through collaboration with LPCH and SHC
 - Recruitment of clinical faculty and program leaders (including division directors and chairs)
 - In collaboration with SHC and LPCH, dramatic improvements in the financial performance of both institutions
- ***Interdisciplinary and programmatic initiatives***
 - Formation of the Stanford Institutes of Medicine and Strategic Centers
 - Founding and development of the Joint School of Engineering-School of Medicine Department of Bioengineering
 - Programs in IT including the Center for Clinical Informatics
- ***Academic development and the workplace***
 - Significant improvements in promoting a respectful workplace
 - Creation of the Office of Diversity and Leadership
 - Faculty Fellows Program
 - Coordination with SHC and LPCH Leadership/Mentoring Program
 - Development of an electronic faculty appointments and promotions process
 - Reclassification of academic appointments and tracks
- ***Integrated institutional and facilities planning***
 - School of Medicine Master Plan
 - Coordination of programmatic and capital planning throughout the medical center
- ***Improved interactions within the medical school and with the university – the basis for cultural transformation***
 - The divide between basic and clinical science leaders that was so dominant at our first retreat has been successfully repaired.
 - The negative relations with the greater university that existed during and following the merger and de-merger (and prior to that) has been very significantly reversed and improved.
- ***Improvements in communications within and outside Stanford***
 - A decade ago Stanford Medicine was portrayed quite negatively in the press, which tended to focus on its negative and hostile workplace and only in a limited way on the role that Stanford Medicine played in transforming health and science. That pattern of communication has been

reversed, because of the improvements in our work place and the contributions of our faculty and also because of the efforts of our Office of Communications and Public Affairs.

- ***Leadership in public policy and related initiatives***
 - Stanford has played a leadership role in advocacy and support for research at both the state and national levels and in efforts to reverse the anti-science views that have been so dominant during the past 8 years.
 - Stanford has played a leadership role in addressing issues of conflict of interest in education, research and patient care.
- ***Success in fundraising***
 - During the last several years Stanford Medicine's success in fundraising has grown to become among the best among medical schools in the nation.

Within this context, the challenges facing us focus on what we need to do to make our institution as strong and successful as possible. To accomplish this mission we need to make the careers of faculty, students and staff as successful and fulfilling as possible. This will be particularly challenging given the forces now in play.

Present and Future Challenges and Opportunities

Taken together, our history and its evolving culture, our workforce and its evolving composition and the external and internal forces impacting academic medicine in general and Stanford in particular, converge to present us with significant challenges as well as important opportunities. We are fortunate in being an institution whose mission is well-defined and whose faculty both recognize and feel aligned to that mission. But we are also an institution comprised of different constituencies with different goals, expectations and perceived support and recognition. Going forward we must seek to make Stanford Medicine as outstanding as possible – and one whose whole is clearly greater than the sum of its parts.

Achieving this goal will require support and recognition for all members of our community – even though their individual goals and objectives may vary. Such support begins at the individual level and is best expressed at the unit, division and department level. It mandates the focused engagement of our chairs, chiefs and leaders. It will require valuing all members of the community and recognizing that we cannot be a great medical center just because we do world-class research. We also need to deliver world-class clinical care and do so with excellence in quality and service. We must make education a valued priority. And we must recognize and support the different needs of our basic science faculty, our clinical faculty, and our clinician-educator faculty, as well as women and men faculty. Finally, we need to recognize and accommodate the need to balance professional careers with personal and family balance and, more broadly, to shape a work force that is suited to the pressures and demands of the 21st Century.

Based on these findings and issues, we can begin to set some goals and priorities that should become the responsibility of our units, divisions, and departments and their leaders. Some initial suggestions for discussion and action include:

- Given the pressures for research funding resource limitations, how can our divisions and departments better assure that our graduate students, postdocs and research faculty will be successful in their research careers?
 - How can the division or department best guide junior faculty to do world-class research and also balance their lives?
- Given the demands and pressures on our clinical science faculty, what innovative things can the division and department do to improve the quality of their professional life as well as their work-life balance?
 - Examples might include development of part-time appointments or even a “job-share” program.
- Being a great academic medical center requires that each member of our community feel valued and that everyone embraces shared missions and goals. While there is alignment around the importance of research, there appears to be lesser value given to our patient care mission – and this is felt particularly by Clinician Educators.
 - At the unit, division, department level, what can be done to better value and engage clinician educators? How can we transform our culture to such that Clinician-Educators feel and more valued member of our Medical School/Medical Center community?
- Given the economic challenges that stand before us, how can divisions and departments better align the constituencies that support missions in research, education and patient care – recognizing the multiple pulls and expectations coming from the medical school, the teaching hospitals and the university?
- What kind of interdisciplinary community building groups can be put together to foster interaction among otherwise diverse members of our medical school, medical center and university?
- Career development and faculty satisfaction evolve over time and throughout the span of one’s career. What cultural changes are needed at the unit, division and department level to provide mentoring and guidance for faculty during the various stages of their career – junior faculty, mid-career and senior faculty? Even more fundamentally, what cultural transformations are necessary to make this a shared responsibility and accountability between faculty and department leaders?

As you can see, we have an ambitious agenda – which we will begin to address during the rest of this retreat. However, the retreat is only the first phase of what will be an ongoing set of initiatives at the department and division level that will indeed create a culture in our school that fosters faculty success.

How We Can Create a Culture That Fosters Career Development and Success

Following my address (see above) the retreat attendees first identified a long list of issues and topics related to career development. From this list they voted individually for their top choices, which were distilled to a “Top 9” list. The attendees then broke into nine work groups that each addressed one of these important issues and themes and developed suggested action plans. The nine topics were:

- Valuing clinical care
- Mentoring
- Valuing collaboration
- Increasing the value of teaching
- Leadership diversity
- Clinician Educators
- Faculty development in times of financial constraint
- How to change the paradigm of the ideal worker: Designing new ways of working differently
- Metrics of faculty success

During the next weeks we will be asking each division and department to decide on one of these issues/topics to develop further and implement. Later in the year we will plan presentations from the departments and divisions that have worked on common themes and issues to share best practices and to thus advance our efforts to transform our culture to better foster career development and satisfaction for our faculty at all stages of the career pathway.

Upcoming Event

Stanford Health Policy Forum: “AIDS: More Than A Virus”

Wednesday, March 11

11:00 am – 12:30 pm

Clark Center Auditorium

The second event in the inaugural year of the Stanford Health Policy Forum series will feature a conversation with Dr. Peter Piot, one of the world’s leading AIDS policy experts, Dr. Piot, who recently completed 13 years directing all United Nations AIDS programs, will address the necessity of tackling the political and economic factors that contribute to the epidemic’s continuing proliferation. In a candid discussion with Paul Costello, Director of Communications for the Stanford School of Medicine, Dr. Piot will address AIDS as “more than a virus” before dialoguing with the audience.

Space in the Clark Center Auditorium is limited, so if you are interested in attending, please RSVP online at <http://www.stanfordtickets.org/tickets/calendar/view.aspx?id=2443> or call the Stanford Ticket Office at 650-725-2787.

Awards and Honors

- **Dr. Ralph Horwitz**, the Arthur Bloomfield Professor and chair of the Department of Medicine, learned that the ACGME Residency Review Committee approved all of the residency and fellowship programs with high distinction. This is an honor that reflects well on the department, division chiefs, program directors, faculty, staff, residents and fellows. Congratulations to all.
- **Dr. Tom Krummel**, the Emile Holman Professor and chair of the Department of Surgery, has been selected to receive the 2009 Santa Clara County Medical Association “Outstanding Achievement in Medicine” Award. Congratulations to Dr. Krummel
- **Dr. Ron Levy**, the Robert and Helen Summy Professor and chief of the Division of Medical Oncology in the Department of Medicine, will receive the King Faisal Award in Medicine in March 2009. Congratulations to Dr. Levy.
- **Dr. Tirin Moore**, Assistant Professor in the Department of Neurobiology, is among the 18 individuals who have been honored with an award from the National Academy of Sciences (NAS). She has received a Troland Research Award for her fundamental and insightful contributions to our understanding of the neuronal mechanisms that control directed visual attention. This award is given annually to young investigators to recognize unusual achievement and to further their research within the broad spectrum of experimental psychology.

Appointments and Promotions

- **Jennifer M. Abidari** has been reappointed as Clinical Associate Professor of Urology (Pediatric Urology), effective 9/01/08.
- **Rodney Altman** has been reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 12/01/08.
- **Kae Bendixen** has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/01/09.
- **Jonathan E. Benjamin** has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 2/01/09.

- **Cheryl Branson** has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 1/01/09.
- **Michael J. Bresler** has been reappointed as Clinical Professor of Surgery (Emergency Medicine), effective 9/01/08.
- **Robert Castro** has been appointed as Clinical Professor of Pediatrics (Neonatal and Developmental Medicine), effective 2/01/09.
- **Stephanie Chan** has been promoted to Clinical Associate Professor (Affiliated) of Medicine (General Internal Medicine), effective 12/01/08.
- **Jing Wang Chiang** has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 10/10/08.
- **Elizabeth G. Corrin** has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Child Psychiatry), effective 9/01/08.
- **Glenn DeSandre** has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Neonatal and Developmental Medicine), effective 2/01/09.
- **Frederick M. Dirbas**, has been promoted to Associate Professor of Surgery at the Stanford University Medical Center, effective 2/01/09.
- **Marthand Eswara** has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics, effective 9/01/08.
- **Christophe Gimmler** has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08.
- **Dita Gratzinger** has been appointed to Assistant Professor of Pathology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 2/01/09.
- **Rami Keisari** has been reappointed as reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics (Pulmonology), effective 2/01/09.
- **Rohit Khosla** has been appointed to Assistant Professor of Surgery at the Stanford University Medical Center and at the Lucile Salter Packard Children's Hospital, effective 2/01/09.
- **Edward Klofas** has been reappointed as Clinical Associate Professor of Surgery (Emergency Medicine), effective 9/01/08.
- **Sanjay Kurani** has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 12/01/08.

- ***Santhi Lingamneni*** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 2/01/09.
- ***Mendy Boettcher Minjarez*** has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Child Psychiatry), effective 2/01/09.
- ***Miguel Moreno*** has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 2/01/09.
- ***Pravene A. Nath*** has been appointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 1/01/09.
- ***Anna A. Penn*** has been reappointed to Assistant Professor of Pediatrics, effective 4/01/09.
- ***Kathleen L. Poston*** has been appointed to Assistant Professor of Neurology at the Stanford University Medical Center, effective 2/01/09.
- ***Daniel L. Rubin*** has been appointed to Assistant Professor of Radiology, effective 2/01/09.
- ***David Schneider*** has been promoted to Associate Professor of Microbiology and Immunology, effective 2/01/09.
- ***George Sternbach*** has been reappointed as Clinical Professor of Surgery (Emergency Medicine), effective 9/01/08.
- ***Clifford Wang*** has been promoted to Clinical Associate Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08.
- ***Lei Xing*** has been promoted to Professor of Radiation Oncology, effective 2/01/09.

Dean's Newsletter Special Edition February 23, 2009

Important and Evolving Events Related to the NIH and Biomedical Research

I am sending this special newsletter to update you on some of the changes unfolding at the NIH as a result of President Barack Obama's signing the American Recovery and

Reinvestment Act of 2009 (ARRA) into law on February 17, 2009. I know you have heard much about the economic stimulus over the past days and weeks, but there are notable impacts on the NIH that I want to call to your attention. The information we have at this point is still sketchy and over the next weeks I will amplify it as plans become codified in Bethesda.

As you also know the NIH budget has been flat (and below inflation) for the past six years, since the NIH doubling was completed in 2003. During the past several years we and many others have been working diligently to restore the NIH budget – one of our nation’s most important investments. And while the news has been mostly gloomy, that has changed dramatically in the past week. As a result of the ARRA the NIH will receive \$10.4 billion – that must be spent by September 2010. The magnitude of the NIH investment is a result of the incredible advocacy and support of Senator Arlen Specter (R-PA) who has been an extraordinary proponent of biomedical research. Senator Specter teamed with Senator Tom Harkin (D-IO) to achieve this level of funding. We are also grateful to the enduring support of Congresswomen Nancy Pelosi (D-CA) and Anna Eshoo (D-CA). While we all recognize that this is an enormous investment and although we might have wished that it could be spent over several years rather than over the next 19 months, it is clear that the Congress sees biomedical research as an area that could help spark the economic recovery through the preservation and creation of new jobs, as well as the impact of science and technology on improving health and innovation at the local and national level.

Of course the immediate question is how this money will be allocated and spent so as to assure that the investment is wise and successful. This has been a topic of intense discussion during the past days and I want to give you an update on what we have learned to date. My information comes from a meeting this past week with the Administrative Board of the Council of Deans of the Association of American Medical Colleges (AAMC) in DC and a conference call led by Dr. Raynard Kington, Acting Director of the NIH. Here’s what we have learned to date:

General Issues

- The \$10.4 billion for the NIH must be spent by September 2010. This must be viewed as part of the economic stimulus and there should be no expectation that this will reset the base budget of the NIH. Simply put, for FY11 the NIH allocation may be at the same level it is now. That said, it is certainly plausible that if the use of these funds is successful and wisely spent, that continued support for the NIH will be in the offing – but this is not guaranteed.
- This funding cannot be viewed as “business as usual.” Because funding (except for construction) cannot be carried over beyond September 2010, the NIH will only award it to projects that can be completed during this very tight timeline. And they will focus particularly on whether the funding will preserve or create jobs.
- There will be intense reporting requirements – unlike anything we have had to do to date. Specifically, it is likely that recipients of ARRA funding (whether institutions or individuals) will be required to provide on line updates to a

publicly searchable website – Recovery.gov, as well as to the NIH. We were told that this will be at the level of the investigator and that an exquisite level of transparency is expected. Obviously, failure to spend the funds on the proscribed timelines will be a source of embarrassment (at least) for the individual and the institution.

- Accordingly, Dr. Kington was clear that individual and institutions should only apply for funding if they are sure that they will spend it.
- Continued efforts to support new investigators will continue and there may be support for post-doctoral fellows in recognition of the tight job market at this time. However it is not currently expected that training grants will be a priority.

Current allocations and expectations for spending the \$10.4 billion.

Dr. Kington was clear that the information he was sharing was subject to final approval by the Executive Branch – but that this was roughly how things are lining up.

- ***Support for construction and infrastructure***
 - **\$1 billion** is allocated for renovation, alternation and construction in the extramural program. As you know, there have been few to no construction dollars in recent years, so this is a major investment in the aging laboratories and facilities at universities, institutes and academic centers.
 - Of note is that construction funds can be spent over 5 years – which is the only exception to the completion of spending by September 2010
 - **\$500 million** is allocated for NIH facility renovation, repair and construction (in Bethesda or other NIH sites)
 - **\$300 million** is for shared instrumentation and other capital equipment. This will be done through NCRR.
 - One important note is that the NIH and NCRR will likely suspend the usual rules for “institutional matching” for shared instrumentation – which is additional good news in light of the negative economic impact on most every university and research institution.
- ***Support for science and research***
 - **\$8.2 billion** is for science and research of which \$7.4 billion will go to the Institutes, Centers and Common Fund on a percentage formula and \$800 million will go the Office of the Director (in addition to the Common Fund noted above) to further support research activities that can be completed in two years and that create alignment to further foster the goals of ARRA.
 - According to Dr. Kington, Institutes and Centers will set their own priorities on how this money is spent – but each will be responsible for assuring that it is high priority science that can be completed prior to September 2010.

- In addition, \$400 million will be transferred from the Agency for Healthcare Research and Quality (AHRQ) to fund research in health quality, effectiveness and outcomes. This will complement separate allocations to AHRQ and to the Office of the Secretary of HHS for health quality and outcomes research. Clearly the magnitude of this funding is way beyond what has occurred historically and is evidence of the Administration's intent to further impact health care reform through research on quality and effectiveness.
- ***Mechanisms for funding.*** At this point several mechanisms are planned and others will unfold
 - Funding of “recently peer reviewed, highly meritorious R01 and similar mechanisms capable of making significant advances in two years.”
 - NIH will also consider funding new R01 applications that have a reasonable expectation of making progress in two years.
 - Dr. Kington was specific in noting that certain types of research would not likely fulfill these criteria – specifically clinical trials that ordinarily require much longer time-lines for completion.
 - Targeted supplements to current grants will also be pursued (which can include equipment and infrastructure support) as well as “competitive supplements” where a new direction is proposed to an existing grant – as long as the project can be completed in two years and is deemed a high priority.
 - *The NIH Challenge Grant Program.* The details are being worked out and will likely have Institute/Center specificity and are expected to support novel projects that advance science and health and that are deemed a high priority and can be completed in the two-year time frame. Currently it is anticipated that these will be \$1 million (over two years) and that NIH may allocate between \$100-200 million to this new challenge grant program.

What We Are Doing to Prepare for the ARRA and Increased NIH Support

Clearly the first priority is to make sure you are informed about what is going on since it is clear that decisions will be made very rapidly. With that in mind, I am putting together a School-wide planning effort that engages our Institutes and Centers and related programs that map to NIH Institutes and Centers. Each area will have a planning group and we will use our Office of Institutional Planning to help create alignments and communication mechanisms to faculty. I am also exploring ways to delegate support from our Office of Medical Development, Communications and Planning so that we can assist faculty with proposals for science and infrastructure support. I will have more to say about this in coming days and weeks. I did want to share the information we have now and to underscore that this is a unique and special opportunity and we certainly want to do all we can to benefit our school, community and the nation.

It also bears underscoring that we will need to coordinate efforts – especially around submissions for equipment and infrastructure support. And we will need to be creative in

fostering new public-private partnerships to further support our efforts – especially beyond the two years of NIH support. This is a unique time in so many ways – and we are now faced with a remarkable opportunity. We will do all we can to help make this opportunity as successful as can be – but ultimately that success rests on our faculty, whose efforts we want to support as best we can.

Dean's Newsletter

March 2, 2009

Healthcare Reform, Wellness and Society

A potential silver lining to the ongoing economic meltdown affecting our local and global community is the prospect for serious healthcare reform in the United States. We remain the only developed country without a defined and equitable healthcare system despite the fact that we spend twice as much on medical care than any other developed nation – and with no clear metric(s) of success. I have highlighted this problem in previous issues of the Dean's Newsletter and won't recount all the issues here. But I do want to add another issue that should factor into the debate: individual choice and societal benefit(s).

The dipole of individual versus society is relevant when personal choice incurs community costs and risks. These dynamics are also impacted by the plethora of factors influencing the healthcare debate: the broad medical industrial complex, which includes the insurance and pharmaceutical industries; the interests of hospitals, physicians and other health care providers; the views of employers and unions; the perspective of local, state and federal governments (including elected officials and, of course, lobbyists); and the attitudes, views and support of individuals. Part of our heritage – and culture – is the expectation for personal choice. However, sometimes those choices conflict with what is best for both the individual and society – and often they incur real costs.

A well-described personal versus societal choice is tobacco use. Even though the consequences of smoking are well known – for the individual and society – we have not, as a nation, held the individual culpable for poor personal health choices. More recently, healthcare wellness programs have offered benefits to individuals who do not smoke. In fact, some organizations (including at least one healthcare provider) have decided not to employ individuals who choose to use tobacco. But medical treatment is not denied – nor is the cost for care differentially shared for those who develop smoking related illnesses. But to what degree should personal choice be taken into account when serious and potentially preventable disease can be avoided? Without question this is a “slippery slope” issue that raises a number of questions and conundrums for the individual and society.

This debate is the topic of the current issue of *Stanford Medicine* (see: <http://stanmed.stanford.edu/2009spring/article1.html>) – wherein the factors influencing the personal versus societal decisions regarding immunization are presented and discussed. I think the debate needs to be taken a step further. There is no question that the

vaccines discovered and introduced during the second half of the 20th century and beginning of the 21st century have transformed global health. The elimination of smallpox and the near eradication of polio, along with numerous other childhood diseases, have been stunning. As just one example, I well remember caring for a child with *Haemophilus influenza* type B meningitis on my first day as an intern at the Children's Hospital, Boston and watching the devastating neurological consequences unfold in this 8 month-old infant. Importantly, at that very same time a group of investigators were working at that very institution to develop a vaccine against this serious childhood illness. Ultimately their pioneering work led to the HiB vaccine. I also well remember happily noting, when I returned two decades later, that H. flu meningitis had been essentially eliminated at this same hospital because of the effectiveness of the HiB vaccine. That also has been the story with numerous other viral and bacterial infections– thanks to effective immunization(s).

While these research accomplishments and their impact on society are cause for celebration, it is a sad testament that recent years have witnessed an increasing number of parents opting out of immunizing their children. The factors behind this are described in a series of articles and interviews in *Stanford Medicine* (see: <http://stanmed.stanford.edu/2009spring/article1.html>). Left unresolved is the question of how we determine and adjudicate the responsibility of individuals – whether parents, physicians or scientists – and society, when personal choices impact individuals and also have consequences for communities. Of course, no one of us would deny care to a child who develops a serious disease that might have been prevented by a vaccine when the choice was made by a parent or healthcare provider not to immunize him or her. But how should we react to a serious infection in a child that might have been prevented – or to a community that becomes subject to the outbreak of an infection that could have been avoided by immunization? The choice by an individual parent or care-provider not to immunize a child has broader health consequences. Sadly, this is becoming a matter of significance across the US as well as the world. Health care choice has been viewed as a right– but when does personal choice conflict with the health of children and communities? Such conflicts are not new, but they are occurring on a broader scale and with higher risks for individuals and societies.

We seem poised to renew a commitment to healthcare reform, and an important aspect of the dialogue is a focus on wellness and disease prevention. This discussion will need to include a recommitment to using the fruits of the science that has led to a plethora of viral and bacterial immunizations that prevent serious disease. But that will pit personal choice against societal as well as personal health. Once again the editorial board of *Stanford Medicine* and our Office of Communications and Public Affairs have done a terrific job of bringing the issues surrounding immunization to our attention – and hopefully to that of the greater community concerned about the health of individuals and society.

Appointment of Dr. Sherril Green as Chair of Comparative Medicine

I am very pleased to announce the appointment of Dr. Sherril Green as the next chair of the Department of Comparative Medicine. Dr. Green, who is currently Professor of

Comparative Medicine, will succeed Dr Linda Cork on September 1, 2009. Dr. Green holds a DVM from LSU and a PhD (neurobiology) from UC-Davis and has been a distinguished member of the department since 1995. I look forward to working with her and her colleagues to advance the scientific and educational agendas of the Department and provide outstanding veterinary care and services at Stanford.

I also want to thank Dr. Cork for her exemplary service as chair of Comparative Medicine since May 1994. Dr. Cork is a distinguished neuroscientist who has played an crucial role in shaping the department of Comparative Medicine, recruiting and supporting outstanding clinical and research faculty and assuring that Stanford met, with excellence, the ever increasing number of regulatory requirements and guidelines for research veterinary services. We are indebted to Dr. Cork for her longstanding leadership and advocacy for our faculty and for comparative medicine and appreciate her continued service through the end of August.

The Emergence and Evolution of Academic Medical Centers: Old and New Lessons

Next year, 2010, will be the 100th anniversary of the Flexner Report. This report, published by Abraham Flexner as the “Carnegie Foundation Bulletin Number Four,” was instrumental in shaping medical education and the formation and evolution of academic medical centers during the 20th century. Many of the characteristics of what we know in this country as academic medical centers can be traced, at least to some degree, to the Flexner Report. That said, while it is well recognized that there is considerable variance in the organization, governance, function and effectiveness of the nearly 130 academic health centers in the US, it is less appreciated that these confederations of medical schools together with other professional schools (e.g., dental, nursing, public health, pharmacy) and teaching hospitals and clinics are relatively distinct to the US.

Overall, academic medical centers comprise less than 5% of our nation’s hospital systems. They are composed of what will soon be 130 schools of medicine (and related professional schools) and approximately 600 teaching hospitals, approximately a third of which have major affiliation and alignment to these professional schools. Their importance comes from the fact that they provide medical care and services for nearly 20% of the most complex patients in the nation, carrying out procedures and interventions that are not available (or done as well) in community hospital settings. Most importantly, they serve as the wellspring of discovery and innovation, and they educate and train the physicians and health care professionals for the future. Many also provide a “safety net” for individuals who would otherwise lack access to medical care. Thus they have become an important component of the fabric of American medicine, and they bring value to our communities and excellence in health care education and innovation to our nation.

In recent years countries in Europe and Asia have been assessing whether to reorganize their own medical education, research and patient care activities into coordinated and integrated entities analogous to our academic health centers. As they do so, they uncover and highlight a number of the challenges and tensions that we have almost come to be

taken for granted. Importantly, they also have an opportunity to learn what has worked or not worked in the US and, where possible, to do things differently.

I have had the opportunity to share our Stanford experience and organizational model with leaders in the United Kingdom, Canada, South America and Asia. In fact, this past week I met with leaders from throughout Asia in a summit organized by the Association of Academic Health Centers (AAHC) (I serve on the Board of Directors of the AAHC, and I am Chair-Elect). This meeting, which was held in Singapore, brought together academic medical leaders from throughout Asia and Australia for a clear-minded dialogue on the experiences in developing academic health centers in these nations. One common and traditional challenge these nations face is that their medical schools and universities come under their “Ministry of Education” whereas the state, or the Ministry of Health, runs their teaching hospitals. Accordingly, integrating these medical schools and teaching hospitals into “academic medical centers” requires legislative and governmental changes as well as shifts in financial support and organization. Such changes in policy are not easy to achieve – although progress is being made in the UK, Singapore and parts of China.

It is also notable that most Asian and European medical schools educate practicing doctors. Those who seek to become a physician scientist require additional training and invariably pursue a PhD degree. However, working as a physician-scientist is a still nascent career and is confounded by the pushes and pulls between the forces of academic research and expectations for patient care. It was with that in mind that I was asked to deliver a plenary lecture entitled “*Protecting the Academic Mission in the Face of Increasing Clinical Demands.*” In comparing the factors that threaten the academic mission at Stanford – or other programs in the US – to those that exist in Asia, I observed common themes, even when the reason for the stressors are different.

The commonly articulated tension is the need and demand for the physicians who are employed by medical schools and universities to care for increasingly larger numbers of patients with little time or support for protecting or even providing time for academic development and enrichment. This is made worse when the hospitals and medical schools are loosely connected and especially when the hospitals and medical school/universities are separately governed. The situation is somewhat better when the hospitals and schools are more fully integrated, but even then, the same tensions around time, protection of the academic and teaching mission and clinical care demands are still expressed and deeply felt. Moreover, there was general recognition that these tensions will likely worsen with the economic downturn and the increased financial pressures that will be placed on state and national governments and on the private and public sectors. Thus there was considerable interest in trying to learn from the US experience.

In honesty, however, the experiences of American academic medical centers reflect these same tensions and liabilities. Even when the medical school and its related hospitals are more closely integrated, the expectations of success from a hospital perspective are not often or always consonant with an academic role. And while the distinguishing features of teaching hospitals are the contributions of faculty physicians in discovery, innovation,

education and training, providing time for these activities is invariably a challenge – and one that is getting worse. Clinical faculty who have responsibilities (and desires) to participate in all three of the core missions of patient care, teaching and research are essential to the future success of academic medicine – but this is the group most vulnerable to polarizing forces, expectations and demands. Seeing more patients, accruing the requisite RVUs, providing patient care with quality and patient-centricity and educating students, residents, fellows and colleagues are essential to the clinical mission and success of a teaching hospital. Carrying out these activities takes considerable time, and the pressures to provide them not infrequently take precedence over individual academic goals and expectations. A challenge arises when these same clinician-scholars are evaluated on their accomplishments in all three areas – patient care, teaching and research – at the time of appointment, reappointment and promotion.

It is not surprising that many of these faculty feel caught between two masters and very much squeezed in a vice of limited time and multiple responsibilities. Of note, these feelings were expressed by our colleagues throughout Asia, and they are certainly also experienced by faculty in academic centers through out the US. This tension was very much part of the theme and dialogue of the 2009 Leadership Retreat that I reported on in the February 17th issue of the Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/02_17_09.html#1). Moreover, based on recent surveys and informal dialogues, it is an important element of faculty satisfaction – or dissatisfaction. And, as stated already, the stresses now being experienced are likely to become even worse as business and academia react to declining financial resources and, as a result, have less ability to provide support for faculty development *per se*.

These issues make it imperative for leaders in Asia and elsewhere to critically assess their visions, goals and objectives. The mantra of the 20th century and until recently has been that growth, especially on the clinical side of the equation, is essential to secure financial success and provide depth and excellence across a wide array of services. But that comes with a price tag, not the least of which is the widening gulf between expectations, on one hand, and day-to-day demands on physicians and faculty on the other. We often acknowledge that being strong in research does not mean that we should not also be strong in patient care – and that we should value them as equally important and, of course, inextricably interrelated. But how big those respective missions and domains become and how one places pressure on the other to fulfill its mission will ultimately define the success of the overall enterprise.

At last year's Strategic Leadership Retreat we addressed the theme of quality and balance across our missions in education, research and patient care (http://deansnewsletter.stanford.edu/archive/02_11_08.html#b). Because of the limitations on faculty growth at Stanford, we are compelled to assess critically and carefully how we prioritize our activities. We can't be all things to all people. That said, it simply requires more people to provide in-depth and high-quality patient care than it does to conduct a specific research program, and so choices become necessary. And as we make those choices, we need to be attentive to institutional values and the very culture we seek to preserve and enhance. That may mean not growing in some areas and putting

even greater emphasis on preserving our ability to discover and to innovate while, at the same time, being clear that we will provide outstanding patient care but perhaps on different scale that might have been forecast in prior times.

Obviously these are issues requiring frequent reexamination, especially at times when we are called upon to deploy more resources to support them, whether capital or programmatic. And of course we cannot do this in isolation, since many external forces and events are rapidly unfolding (from the consolidation of health care services in the Bay Area, to the changing financial landscape and the emerging prospects of significant health care reform). Hence, it becomes ever more important to shape our own destiny than to be reformulated by the expectations or demands of others who are likely to be less attentive to what Stanford Medicine should be in the years and decades ahead.

Not surprisingly, while the original purpose of my travel to Singapore was to share the experiences we have had in the evolution of academic medical centers in the US, I returned with more questions and thoughts about what we need to do to further define and reshape our own programs and institutions, including Stanford Medicine.

Update on the Stanford Cancer Center

On Friday, February 20th Dr. Bev Mitchell, Director of the Stanford Cancer Center and the George E. Becker Professor in the Department of Medicine gave an update on the progress in achieving NCI designation for our Cancer Center. A summary of her report follows:

"Since its designation by the National Cancer Institute in 2007, the Cancer Center has continued to expand its activities in the integration of basic science, clinical research, and population science with the objective of improving cancer prevention, early detection, and treatment. The membership has grown from 260 at the time of the core grant submission to 320 as we enter our next competitive submission in May 2009. Its objective is to build on the talents of these members to promote and foster collaborative research in the broad effort to reduce cancer mortality.

Stanford has long been regarded as having excellent basic science cancer research. What has not been as evident to those outside the institution is its expertise in clinical and translational research and building in those areas, especially in the solid tumors, has been a major focus of cancer center activity. The untimely death of Steve Leibel in February 2008 left a large void in the clinical leadership. In January 2009, Brandy Sikic took up the mantle of Associate Director for Clinical Research. With his background in cancer clinical trials, laboratory-based research, and running the GCRC, Brandy brings broad expertise to this position. The position of Medical Director of the Clinical Cancer Center has not yet been filled. Over the past 21/2 years, Stanford as an institution has succeeded in recruiting a total of 46 individuals in 13 Departments with cancer-relevant clinical and research interests. Of these, 28 have interests in solid tumors and 9 have combined M.D./PhD. degrees. The Cancer Center partnered with Departments to assist in 18 of these recruitments and 5 individuals have been recruited as a direct result of cancer center/stem cell institute-initiated searches. This is a record that was only made possible

by the concerted efforts of many Departments and, given the relatively small size of the institution, shows a genuine commitment to enhancing our cancer research efforts and the care of our cancer patients.

The Cancer Center has been supported by a relatively small NCI core grant of \$1 million per year, as well as the truly generous gift of John and Jill Freidenrich to support our translational research recruitments and efforts. Stanford Hospital and Clinics has helped to support our clinical trials infrastructures, as has Lucille Packard Children's Hospital. The Ludwig Center for Cancer Stem Cell Research under the leadership of Irv Weissman has enabled the Center to support seed grants and basic science core service infrastructure, while President John Hennessey's gift has enabled a large number of seed grants to be funded that have helped to promote collaboration. Last, but certainly not least, the School of Medicine's commitment has enabled the Cancer Center to become a reality in a remarkably short period of time. The Center is particularly proud of the increasing collaborations with the Northern California Cancer Center, an institution that offers the expertise of many excellent epidemiologists and a well-developed outreach program. NCCC also offers a wealth of data on cancer incidence, prevalence and outcomes in the Bay Area that can be mined by researchers at both institutions. Incorporating population-based studies into ongoing efforts in genomics, imaging, and other initiatives is one of the Center's major objectives and opportunities exist to use these data sources in the Comparative Effectiveness initiative that is part of the Administration's stimulus package.

Another very important function of the Center is to support shared resources that support cancer research through the NCI core grant. The Center will help to fund 11 of these facilities, including the immune monitoring core, an expanded genomics facility to include high throughput sequencing, and the high throughput bioscience center, during its next funding period. Questions about shared resources can be addressed on the cancer center website (<http://cancer.stanford.edu/>).

The contributions of cancer center members to advancing cancer research are numerous and of high impact. Of special note, are the unique and innovative imaging program under the leadership of Sam Gambhir and Chris Contag and the contributions of the Canary Foundation and the Department of Radiology to our efforts in the area of early detection of cancer. The potential for Stanford investigators and their collaborators to make a profound impact on the cancer field in the years ahead is extraordinarily high."

Reducing Risk to Research Samples

On February 5th the School of Medicine joined the University in an exercise meant to test our emergency plans in the event of a major disaster—in this case, an earthquake measuring 6.7 on the Richter scale. It became clear during the exercise that because emergency power would need to be focused on sustaining research animals and other life-support needs, and supplies of diesel fuel to power our emergency generators would be diverted to more critical needs, such as hospitals, refrigeration for research samples stored in the School's more than 600 freezers would be compromised within 24 to 36 hours-- a catastrophic loss for research.

With this in mind, we are continuing to pursue technologies and processes to limit research losses under disaster scenarios. We have already piloted dry storage technology; the Stanford Sustainability office recently purchased room temperature storage technology to allow several laboratories in the Medical School to test room temperature storage. The technology enables room temperature storage of biological samples including purified DNA, RNA, and plasmids housed in E.coli traditionally stored at -80, -20 and -4 degrees Celsius. In the pilot, twelve laboratories transferred over sixty thousand DNA or RNA samples out of the freezer to non-frozen storage technology, and fourteen additional labs provided sample collection data. The study found nearly a million candidate DNA and RNA samples for room temperature storage within the freezers of the 12 pilot labs. Initial estimates from the study project the collective savings for campus could be over 800 tons of CO₂, and nearly \$1.2 million in costs annually—while eliminating the risk to samples associated with loss of power. There will be more information forthcoming in a future newsletter.

Another avenue we are pursuing is a preferred vendor contract with an out-of-state freezer storage facility that can safely store valuable samples. We have a final proposal from a company in the Midwest, and will be sending information on how to use this service to the departments soon.

We will continue to update you on these efforts. It is critically important that all our researchers inventory the samples stored in their freezers and plan alternative storage media or sites to ensure preservation of the samples in the event of a lengthy power outage or earthquake. Many thanks to the people and departments who participated in the pilot and who have already taken steps to understand and mitigate risks to our research samples.

Continued Progress in Reducing Trips

Julia Tussing, Associate Dean for Educational Programs and Services, who leads the School's trip reduction effort, has let me know that the School of Medicine had excellent participation on the annual Parking & Transportation survey this past Fall (58%, up from 52% in Spring of 2007). We also continued to improve in self-reported trip reduction.

Since the survey began the School has effected consistent reductions in our drive-alone ratios, and we are now doing better than the University average, with 32% and 28% rates for the morning and evening commutes, respectively. In the Spring of 2006, SOM had a "drive alone" ratio of 45% for the morning commute, much higher than the University average of 39%. We improved to 35% in the Spring of 2007 and 32% in the Fall of 2007, holding steady at 32% for this past Fall. Meanwhile, the University has also improved, but not at the same rate, and we are now at a point below the University average. The afternoon trips during the same time periods for the School have followed a similar curve, starting at 39% in the Spring 2006 and ending at 28% this past fall; for the evening commute, we are now two points lower than the University as a whole. Congratulations on doing your part to reduce pollution and traffic congestion and keep us in compliance with the county's General Use Permit!

Upcoming Event

Stanford Health Policy Forum: “AIDS: More Than a Virus”

Wednesday, March 11

11:00 am – 12:30 pm

Clark Center Auditorium

The second event in the inaugural year of the Stanford Health Policy Forum series will feature a conversation with Dr. Peter Piot, one of the world’s leading AIDS policy experts, Dr. Piot, who recently completed 13 years directing all United Nations AIDS programs, will address the necessity of tackling the political and economic factors that contribute to the epidemic’s continuing proliferation. In a candid discussion with Paul Costello, Director of Communications for the Stanford School of Medicine, Dr. Piot will address AIDS as “more than a virus” before dialoguing with the audience.

Space in the Clark Center Auditorium is limited, so if you are interested in attending, please RSVP online at <http://www.stanfordtickets.org/tickets/calendar/view.aspx?id=2443> or call the Stanford Ticket Office at 650-725-2787.

Awards and Honors

- **Dr. Steven Artandi**, Associate Professor of Medicine (Hematology) and **Dr. Howard Chang**, Associate Professor of Dermatology, have been elected 2009 Members of the American Society for Clinical Investigation (ASCI). Founded in 1908, the ASCI is an honor society that recognizes physician-scientists – including those involved in translating discoveries from the laboratory to the patient. Drs. Artandi and Chang will be officially inducted at the ASCI annual meeting in late April. Please join me in congratulating them for this significant recognition of their respective academic accomplishments.
- **Dr. Maxence Nachury**, Assistant Professor of Molecular and Cellular Physiology, is among 118 early-career scientists, mathematicians and economists selected for a Sloan Research Fellowship awarded by the Alfred P. Sloan Foundation. The Sloan Research Fellowships have been given out since 1955 and are designed to help promising scholars pursue their research interests. Contratulations, Dr. Nachury.
- **Dr. Marius Wernig**, Assistant Professor of Pathology, and his colleagues have received the Cozzarelli Prize from the Proceedings of the National Academy of Sciences (PNAS) Editorial Board. This award recognizes the most outstanding contributions in each of the scientific disciplines represented by the National Academy of Sciences. Congratulations, Dr. Wernig.

- **Dr. Marin Grainger-Monsen**, Director, Filmmaker-in-Residence in the Program in Bioethics and Film, along with Co-Producer Megan Mylan, won the 2009 Academy Award for Best Short Documentary for their film *Smile Pinki*, about a free cleft lip surgery program in India.

Appointments and Promotions

- **Gregory Botz** has been promoted to Adjunct Clinical Associate Professor of Anesthesia, effective 3/01/09.
- **Isabella Graef** has been reappointed to Assistant Professor of Pathology, effective 2/01/09.
- **Lynn Gretkowski** has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 3/01/09.
- **Michael Henehan** has been promoted to Adjunct Clinical Professor of Medicine, Center for Education in Family and Community Medicine effective 11/01/08.
- **Scott D. Oesterling** has been promoted to Adjunct Clinical Associate Professor of Obstetrics and Gynecology effective 1/01/09.

Dean's Newsletter March 16, 2009

A Major Vote of Confidence for Science

The March 9th Executive Order signed by President Obama that overturned the moratorium on embryonic stem cell research has been heralded and echoed around the world. It is exciting that this Order will permit scientists and physicians across the US to engage in embryonic stem cell research in a manner similar to what has transpired in California thanks to the California Institute for Regenerative Medicine (CIRM). But the President's historic action has even broader implications. Together with the inclusion of the NIH and NSF in the American Recovery and Reinvestment Act (ARRA) of 2009, these decisions signal a dramatically more positive level of support for science and technology than has been the case for nearly six years. This bodes well for fostering a spirit of optimism, respect and hope across the entire scientific community – well beyond the impact on stem cell biology and regenerative medicine *per se*.

I hope that each faculty member throughout the School is paying attention to the announcements on ARRA funding and that each of you is included in the informal networks of communication that we have established through our Institutes, Centers and

related organizing bodies. If you do not feel you are included please contact David O'Brien, Director of Institutional Planning (dob@stanford.edu) and he will be happy to assist you.

In addition to the outstanding updates you are receiving from Jeanne Heschele about ARRA and other funding opportunities and those that come to you from our informal advisory network, the HHS is also posting weekly updates on ARRA that you might wish to bookmark: <http://www.hhs.gov/recovery/2009/03/10/weekly/index.html>. These include updates on NIH and other opportunities. In addition, the NIH has also posted a helpful FAQ on the Challenge Grants that were recently shared with you at: http://grants.nih.gov/recovery/faqs_challenge.html. Finally, if you learn anything about funding opportunities that you would like to share more broadly, please send this information to me (ppizzo@stanford.edu), Daria Mochly-Rosen (mochly@stanford.edu) or David O'Brien (dob@stanford.edu).

Some Facts on Biomedical Research and Development

When the American Recovery and Reinvestment Act (ARRA) of 2009 was announced a few weeks ago, many questions arose about how investments in science and technology would help stimulate the economy. The California Healthcare Institute released some helpful facts that may be of interest to you.

Currently California is the home to more than 2000 companies and over 100 universities and non-profit research institutions that are involved in biomedical research. California also leads the nation in grants received from NIH and is the sole recipient of awards through the California Institute for Regenerative Medicine (CIRM). Given that California already receives 15% of NIH funding, it is likely that it will benefit in a relatively proportional fashion to awards made through the ARRA. This will have an impact on universities and by extension on the biotechnology industry. In fact, the biotechnology sector is second only to computer and electronic products in employing people in California.

Investment in biomedical science engages companies, the venture community and the broad public and private sectors. It is estimated that there are approximately 900 medical products in the pipeline in California with 51% in clinical trials. Further investment in science should continue to prime this pump and create new research discoveries, products – and jobs. All of these are good for the economy and further justify the investments in science and technology that are part of the American Recovery and Reinvestment Act of 2009.

The Continuing Financial and Economic Challenge: Impact for 2010

In the coming weeks we will be announcing the principles and factors guiding our budget planning for FY10. It will not come as a surprise that the economic downturn well known to all of us will have a significant impact on our plans and expectations over the next year(s). In planning for our future in this economic environment we want to preserve

what makes Stanford Medicine so outstanding – our excellence in education, research, patient care and our service to our community locally and globally. Naturally this will require some hard choices, and there is no question that we will need to achieve program reductions – almost certainly at around the 10% level – although this will be differentially applied to our various missions. Work on this is already underway in the broader administrative units within the Dean's Office as well as in our Institutes and Centers. We are also planning budget principles for our basic and clinical departments – some of which we will review at the School's Executive Committee on Friday, March 20th.

I do want to let you know that we have decided that the School of Medicine will join with the rest of the University in not having salary increases for FY10 for faculty and staff. I do want to add that salary adjustments for promotions or where market adjustments are clearly justified will be entertained. We are a complex community that includes, among other constituencies, basic and clinical scientists and physicians whose compensation schedules are quite different and clearly we need to take that into account.

Obviously further details will be forthcoming in the near future.

Biosciences Programs Interview Prospective Students for 2009 Incoming Class

Stanford can boast having among the most outstanding graduate education programs in the biosciences in the nation – a testament to our outstanding faculty, resources and most importantly, the quality of our PhD students. This year we received 1422 applicants to our 13 Bioscience programs (some shared with H&S). On March 5-7th departments and interdisciplinary programs hosted 264 of these applicants for on-campus interviews and the opportunity to meet with faculty and students (eight who couldn't attend interviewed at other times). Based on these applicants' records, interviews and other relevant factors, offers have now been extended to approximately 164 of these applicants – with final decisions expected from the accepted students by April 15th. Without question, among our most important investments are our students, and I know that the entire basic science community is deeply committed to attracting the best and brightest students to Stanford – including attracting as diverse a student body as possible. I heard from many faculty leaders how pleased and impressed they were by the outstanding quality of this year's applicants, and we all look forward to welcoming our incoming class of PhD students in this September. I also want to thank the Biosciences staff, the administrators of the individual graduate programs, and our current students for their enormous efforts in making this year's prospective students campus interview program such a success.

Annual Appreciation Celebration for Medical Education Donors

One of the most joyous and meaningful events I have the privilege to attend each year is the Annual Medical Education Donor Appreciation Dinner, which honors donors and friends who have contributed scholarships and support for medical education over the past year. This year's event was held on Wednesday, March 4th in the Arrillaga Alumni Center. Because of the generosity of these individuals and that of countless others over the years who have made donations to support medical education, Stanford Medical

School has the lowest level of medical student indebtedness in the nation. This important issue was discussed in the December 18, 2008 issue of the *New England Journal of Medicine* (<http://content.nejm.org/cgi/reprint/359/25/2629.pdf>), in which it was reported that “the median amounts, including premedical debts, were \$145,000 for students at public medical schools and \$180,000 for those at private medical schools.” Of note, this report, written by Robert Steinbrook, observed that the lowest medical student debt at public medical schools (for 2006) was \$79, 562 at the University of California, San Diego – and that it was \$70,235 at Stanford, the lowest in the nation. While this is still a significant amount of student debt, the donors we honored enable our students to pursue careers in science and medicine that are less burdened and influenced by overwhelming debt. Like many others I understand this on a very personal level. While I did not attend Stanford Medical School, I was the beneficiary of scholarships for my own education. Without that support there would have been no likelihood of my attending college, much less medical school. I feel indebted to those who made that possible – and in that spirit I feel deeply appreciative to the wonderful individuals who make similar opportunities available to our Stanford medical students.

One of the most meaningful aspects of the Medical Education Donor Appreciation Dinner is that it brings together medical students receiving scholarship and financial aid with the donors who provided those contributions. This permits both students and donors to get to know each other on a more personal level, to share their experiences and dreams and to mutually appreciate their interconnectedness. As I had the opportunity to visit with each of the guests attending this event, it was abundantly clear how deeply moving this experience was for both donors and students. Another highlight of the evening was a panel discussion led by Dr. Charles Prober, Senior Associate Dean of Medical Student Education, with six students who shared personal stories about how their life experiences shape their current dreams and aspirations and how those are facilitated by the support they receive at Stanford. The panelists were: Kierann Smith (SMS1), Morgan Theis (SMS1), Joslyn Woodard (SMS1), Joaquin Camara-Quintana (SMS2), Tiffany Castillo (SMS3), and Matt Goldstein (SMS4). It is worth noting that every one of our outstanding students could provide equally compelling perspectives. I want to thank each of our student panelists – and once again, the families and friends who help support their education and careers.

Medical School Reviews Programs and Facilities with University Senate

On Thursday, March 5th we had the opportunity to provide an update to the University Faculty Senate on the status of Phase I planning of our medical school facilities development. This includes the construction of the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell Research Building/Stanford Institutes of Medicine I. This presentation provided a follow-up to the visit that the School of Medicine hosted for the Academic Council in 2007, which forecast these and other future developments. I underscored in this presentation that new facilities are, of course, essential to renew and help facilitate our missions in education and research – but that what makes Stanford a truly distinguished university is quality of the work carried out by our faculty, students and staff. To help illustrate the work of the Institute, Professor Irv

Weissman, Director of the Stanford Institute for Stem Cell Biology and Regenerative Medicine, provided an update on our broad programs in stem cell biology and how these will be further enhanced when the Lorry Lokey Stem Cell Research Building is completed in the summer of 2010. Dr. Renee Reijo Pera, Professor of Obstetrics and Gynecology and Director of the Center for Human Embryonic Stem Cell Research and Education, gave an outstanding update on the work she and her colleagues are doing to develop and characterize human embryonic stem cells and to elucidate what makes them unique.

In case you haven't seen updates of the Li Ka Shing Center or the Lorry Lokey Stem Cell Research Building, here are recent photos shown side-by-side with the architectural renderings of these buildings:

Three Neuroscience Professorships Are Celebrated

On March 6th we had the special opportunity to host an Investiture Celebration for three neuroscience professorships. These professorships make it possible to recruit and acknowledge faculty of remarkable talent who bring distinction to our broader neuroscience community. The professorship holders are:

Graham H Creasey, MD, FRCSEd, the second incumbent of the Paralyzed Veterans of America Professor of Spinal Cord Injury Medicine. Dr. Creasy recently joined the Department of Neurosurgery and the Palo Alto VA Health Care System to lead a program on spinal cord injury – a major initiative of the department, the VA and the Stanford Institute of Neuro-Innovation and Translational Neurosciences.

Lawrence Steinman, MD, the first incumbent of the George A. Zimmermann Professorship. Dr. Steinman has been a distinguished member of the Department of Neurology since 1980 and is a world recognized authority in neuroscience. He has a particular focus on multiple sclerosis.

Thomas C Sudhof, MD, the first incumbent of the Avrum Goldstein Professorship, which was established to honor Dr. Goldstein, one of Stanford's most valued and renowned faculty members. Dr. Sudhof recently joined Stanford from the University of Texas-Southwestern Medical School and is a highly distinguished member of the neuroscience community and the Department of Molecular and Cellular Physiology. He is also a Member of the Howard Hughes Medical Institute.

Please join me in congratulating Drs. Creasey, Steinman and Sudhof.

Awards and Honors

- **Evalene Jones**, Clinical Associate Professor of Medicine, has been named one of the “2009 Women of Influence in Silicon Valley” by the San Jose Business Journal. She will be honored in San Jose on March 18th.
- **Jerome A. Yesavage**, Professor of Psychiatry and Behavioral Sciences, has been awarded the AAGP Distinguished Scientist Award from the American Association of Geriatric Psychiatry. Each year, the Association chooses a member for his or her original scientific contributions to the field of geriatric psychiatry and mentorship of the careers of successful contributing junior researchers in the field, and invites the Distinguished Scientist to present a session as part of the AAGP Annual Meeting. Congratulations, Dr. Yesavage.

Appointments and Promotions

- **Seth Ammerman** has been promoted to Clinical Professor of Pediatrics (Adolescent Medicine), effective 3/01/09.
- **Sangeeta Chona** has been reappointed as Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/08.
- **Patrick Clyne** has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics, effective 1/01/09.

- ***Neena Berry Duggal*** has been promoted to Clinical Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/08.
- ***Brendan O. Duterte*** has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics, effective 1/01/09.
- ***Francis B. Garrett*** has been appointed as Clinical Associate Professor (Affiliated) of Surgery (Emergency Medicine), effective 3/01/09.
- ***Thomas Hafkenschiel*** has been appointed as Clinical Associate Professor (Affiliated) of Surgery (Emergency Medicine), effective 3/01/09.
- ***Magdy Ismail*** has been reappointed as Clinical Associate Professor of Pediatrics (Neonatal and Developmental Medicine), effective 1/01/09.
- ***Dennis Israelski*** has been reappointed as Clinical Professor (Affiliated) of Medicine (Infectious Diseases), effective 9/01/08.
- ***Rashmi Kirpekar*** has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics (Nephrology), effective 1/01/09.
- ***Amy Kostishack*** has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 2/01/09.
- ***Leslie H. Lee*** has been appointed as Clinical Assistant Professor of Neurology, effective 7/01/09.
- ***Michael S. Leong*** has been appointed as Clinical Assistant Professor of Anesthesia (Pain Management), effective 3/01/09.
- ***Andrew Nevins*** has been reappointed as Clinical Assistant Professor of Medicine (Infectious Diseases), effective 3/01/09.
- ***Joseph P. O'Hara*** has been reappointed as Clinical Assistant Professor (Affiliated) of Pathology, effective 2/01/09.
- ***Inger Olson*** has been promoted to Clinical Associate Professor of Pediatrics (Pediatric Cardiology), effective 3/01/09.
- ***Thomas Rando*** has been promoted to Professor of Neurology and Neurological Sciences, effective 3/01/08.
- ***Daniel I. Rosenstein*** has been promoted to Clinical Assistant Professor (Affiliated) of Urology, effective 3/01/09.

- ***Katherine S. Sanborn*** has been reappointed as Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 10/01/08.
- ***Mark Sanders*** has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08.
- ***Rajesh Shinghal*** has been promoted to Clinical Assistant Professor (Affiliated) of Urology, effective 9/01/09.
- ***Eric L. Weiss*** has been promoted to Clinical Associate Professor of Surgery (Emergency Medicine), effective 7/01/08.
- ***Hong Yu*** has been appointed as Clinical Assistant Professor of Neurosurgery, effective 8/01/09.

Dean's Newsletter

March 30, 2009

Dr. Mike Snyder Will Join Stanford as Chair of Genetics

I am extremely pleased to announce that Dr. Mike Snyder, Professor of Biology and Director of the Yale Center for Genomics and Proteomics, has accepted our offer to join Stanford as Chair of the Department of Genetics. Dr. Snyder was selected through a national search led by Dr. Lucy Shapiro, Ludwig Professor of Developmental Biology and Director of the Beckman Center.

Dr. Snyder received his PhD from the California Institute of Technology and did a postdoctoral fellowship at Stanford with Dr. Ron Davis in the Department of Biochemistry. He joined the Yale faculty in 1986 where he also served as Chair of the Department of Molecular, Cellular and Developmental Biology (1998-2004). He has had a highly distinguished career and is the recipient of numerous awards and honors. He is the author of over 240 publications and is highly recognized for his leadership in genomics and genetics. In addition to serving as Chair of the Department of Genetics, Dr. Snyder will lead a new Center of Genomics and Personalized Medicine, which will provide a broad umbrella for school and university efforts in genomics and their application to diagnosing and managing human disease. Stanford is fortunate in having outstanding faculty in genomics and proteomics and we hope that this new Center will create opportunities for interdisciplinary research and education.

I have received enormous support and enthusiasm for Mike Snyder's recruitment to Stanford from faculty across the university as well as throughout the country. I feel confident that he will bring enormous energy, important skills and a strong commitment to foster the careers of students, post docs and junior faculty. Mike plans to join Stanford in early July and will "hit the ground running." Please join me in welcoming Mike and

also in thanking Dr. John Pringle, who has served as the Interim Chair of Genetics since the departure of Rick Myers (in addition to carrying out his responsibilities as Senior Associate Dean for Graduate Education and Postdoctoral Affairs).

2009 National Advisory Council Annual Review

The National Advisory Council (NAC), which advises the President and Provost on the strategic and related initiatives of the School of Medicine, met on Monday, March 16th for its 2008-2009 review. The chair of the NAC is Dr. Ed Benz, President of the Dana Farber Cancer Institute, Harvard Medical School, and its members include: Elizabeth Blackburn (UCSF), Tom Boat (Cincinnati Children's Hospital), Mariann Byerwalter (Stanford Trustee), Ying-Ying Goh (Stanford Trustee), Jennifer Rubin Grandis (University of Pittsburgh), Daniel Lowenstein (UCSF), Mary Cranston (Stanford Trustee), Trudy Mackay (North Carolina State University), James Madera (University of Chicago), David Nichols (Johns Hopkins), Arthur Rubenstein (University of Pennsylvania), William Stead (Vanderbilt) and Michael Zinner (Brigham & Women's Hospital, Harvard Medical School).

I provided the NAC with a comprehensive overview of the School of Medicine's current efforts in education, research and patient care and how these are being affected by known and anticipated internal and external forces. I focused on the impact of the global economic downturn on medical school and university resources and how these will continue to be impacted by changes occurring at the national, state and community level. More specifically, I addressed the likely effect of the American Recovery and Reinvestment Act (ARRA) on Stanford's research funding and our efforts to communicate with and assist faculty applying for research, equipment and facilities support. I also proffered my views about how changes in healthcare might impact funding for patient care and education, especially through the entitlement programs of Medicare and Medicaid. In addition, I reviewed the impact of state funding for healthcare (MediCal) and particularly for stem cell research, in light of the \$42 million California deficit and its impact on bond sales to support the California Institute of Regenerative Medicine (CIRM).

I also commented on how our local communities are affecting important decisions about the future of Stanford Medicine, especially the renewal projects of Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. The future of these projects has important implications for the clinical care, education and research programs of the School of Medicine, and they appear to be highly valued by Palo Alto residents, based on various opinion polls. However, a number of the City of Palo Alto Council members appear to be out of touch with the community and express views that are antithetical to the incredible value that the medical center brings to this community. Sadly, if their views prevail they might jeopardize clinical care programs of enormous importance to current and future generations of Palo Alto and our surrounding communities.

In addition to outlining the various challenges we face, I shared with the NAC the numerous steps we have taken and will continue to take in response to the economic,

programmatic and political forces that are unfolding. Some of these are detailed below; they are consonant with the dramatic shifts occurring at universities and medical centers across the United States. The NAC was interested in how further – and continuing – changes in the economy would impact the medical school and medical center and how we would accommodate to those changes – which would truly threaten significant programmatic investments.

In addition to a focus on the state of the school and medical center, the NAC heard an update on the school's efforts in career planning as well as our efforts in fostering leadership and diversity. Presentations were given by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership; Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs; and Dr. Gary Schoolnik, Associate Dean for Senior Faculty Transitions. Dr. Valantine shared the progress that has been made in the last four years in retention and career development as follows:

Increases in women faculty Stanford compared to national data: comparing 2003-04 to 2008-09 data, the increase in women faculty (50%; 118) exceeded the relative increase in men faculty (20%; 122). For the three faculty ranks combined the proportion of women faculty at Stanford increased 4.6%: Assistant 5.6% (37.9% to 43.5%); Associate 2.6% (31.5% to 34.1%); Professor 4.6% (16% to 20.6%). These increases in women faculty at Stanford were considerably higher than nationally reported data from the 126 US accredited medical schools during the same time period: Assistant 2.1% (38.3% to 40.4%); Associate 1.5% (27.5% to 29.0%); Professor 1.9% (15.5% to 17.4%). These data indicate that at Stanford, the percentage of women faculty at each rank is currently higher than nationally, particularly at the rank of full professor, suggesting that our interventions have been effective in expanding gender diversity in the Stanford faculty.

Increases in underrepresented minority and Asian faculty: Comparing 2003-04 and 2008-09 data, underrepresented minority faculty (Black, Hispanic, and Native American) increased by 56% (19; 34 to 53); Asian faculty by 111% (110; 99 to 209); and White faculty by 36% (204; 567 to 771). Overall, the Stanford School of Medicine faculty increased 54%, however the relative increase was greater for women compared to men: 103% versus 38% respectively. The percent increases for underrepresented minority groups (Black 55%; and Hispanic 57%) slightly exceeded the % increase in the faculty as a whole, and was greater than the increases reported nationally for each minority group.

To further support faculty retention, Dr. Valantine has taken two distinct yet complementary approaches: skills building workshops that provide faculty with the necessary skills for academic career advancement; and mentoring and building a sense of community through leadership programs. Dr. Valantine discussed the progress that has been made in the Faculty Fellows Program (46 faculty have now completed this program), and Dr. David Stevenson described the new Connections Program – also designed to help support and guide the careers of

faculty new to Stanford (see:
http://deansnewsletter.stanford.edu/archive/11_03_08.html#3).

The NAC also seemed to be pleased and impressed with the efforts on senior faculty transitions led by Dr. Gary Schoolnik. I have previously highlighted the work and recommendations of the Transitions Task Force (see:
http://deansnewsletter.stanford.edu/archive/08_25_08.html#4). Affirmation of the impact of this effort was shared with the NAC during a working lunch discussion with several Task Force members including Drs. Harry Greenberg, John Boothroyd, Michael Levitt, James Mark, Linda Cork and Stan Shrier. The website delineating programs and resources to assist senior faculty will be available within the next month or so.

The National Advisory Council also heard updates on three school-wide initiatives: the Stanford Institute for Stem Cell Biology and Regenerative Medicine, the NCI-Designated Stanford Cancer Center and the Stanford Institute for Immunity, Transplantation and Infection. These presentations included updates on the recruitment, programmatic initiatives and capital programs for each of the Institutes.

- **Dr. Michael Longaker**, Professor of Surgery and Director of the Program in Regenerative Medicine, led the presentation about the broad initiatives of stem cell institute and was joined by Dr. Michael Clarke, Karel H. and Avic N. Beekhuis Professor in Cancer Biology; Associate Director, Institute for Stem Cell Biology and Regenerative Medicine, who reviewed Stanford program in cancer-stem cell biology, Dr. Renee Reijo Pera, Professor, Institute for Stem Cell Biology & Regenerative Medicine and Department of Obstetrics & Gynecology Director, Center for Human Embryonic Stem Cell Research and Education, on the development and characterization of embryonic stem cells and Dr. Marius Wernig, Assistant Professor of Assistant Professor, Institute for Stem Cell Biology & Regenerative Medicine and Department of Pathology, on induced pluripotent stem cells (iPS). In addition to the many scientific contributions being made by faculty in the Stem Cell Institute, they have had impressive success in competing for funding from CIRM – Stanford ranks #1, having received 33 research grants and 2 major facility grants (totaling \$101,245, 022) during the past two years (which is 21% more than any other institution). With the change in national policy for stem cell research recently announced by President Obama (<http://deansnewsletter.stanford.edu/#1>) Stanford is poised for major future success – including and importantly in translating fundamental knowledge into clinical and translational research programs.
- **Dr. Bev Mitchell**, Professor of Medicine and Director of the Stanford Cancer, gave an update on recent progress in cancer research, education and patient care. I summarized some of the accomplishments she reviewed in a recent Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/03_02_09.html). Dr. Mitchell and her colleagues are preparing for the submission of their grant to the NCI this May and we are hopeful (and optimistic) that we will receive a full renewal. As one illustration of the innovative work being conducted by members

of the Sanford Cancer Center, Dr. Sam Ghambir, Professor of Radiology and, by courtesy, of Bioengineering and Director of the Molecular Imaging Program at Stanford (MIPS), gave an exciting overview of the work he and his colleagues are conducting on early diagnosis and detection of cancer using an array of molecular, bioengineering and imaging technologies.

- **Dr. Mark Davis**, Avery Professor of Immunology and Director of the Institute for Immunity, Transplantation, Infection, along with Associate Directors Carlos Esquivel, Professor of Surgery, and Gary Schoolnik, Professor of Medicine, gave an update on the significant progress the institute has made in fostering interactive interdisciplinary research communities, in developing an outstanding volunteer leadership council and as a result generating impressive philanthropic support, and in developing the Immune Monitoring Center, which is generating an ever increasing number of collaborations with faculty across the medical school.

While it certainly appeared that the NAC enjoyed the program, presentations and interactions, their official report will be delivered to the President and Provost. It is incredibly important to receive outside critiques about what we are doing well and where improvements are in order. So, I look forward to receiving the report of the NAC after it has been reviewed by the President and Provost – and will be happy to share whatever news I can with you.

AAMC Faculty Forward Program Begins

As you know, faculty success and vitality has long been a priority at Stanford. The cumulative effects of faculty dissatisfaction are costly and can have significant impacts on institutional performance and culture in reduced morale.

To support more in-depth study about medical school faculty job satisfaction, the AAMC is launching a new initiative called *Faculty Forward* that will examine and attempt to improve upon faculty satisfaction, retention, and vitality. A centerpiece of this initiative will be a faculty satisfaction survey developed by the AAMC and the Collaborative on Academic Careers in Higher Education (COACHE) at the Harvard Graduate School of Education. The survey will provide an objective and standardized method to measure satisfaction levels among our faculty and will allow for comparisons and benchmarking with faculty satisfaction at other medical schools. The 3-year Faculty Forward initiative has an initial cohort of 24 U.S. medical schools. I am pleased to report that we are one of those first 24 schools.

Participation in the initiative will allow us to assess what drives faculty satisfaction at our institution, benchmark that information with peer institutions, and provide training and learning opportunities that will enhance our institution's ability to implement changes and improvements to make our school an even more vibrant place for faculty to do their work. Since Stanford participated in the pilot survey administered in 2007, we will also be able to assess changes over time.

In early April, the survey will open at our institution to all **assistant, associate and full**

professors in all lines (UTL; MCL; NTL; CE). Faculty will receive a notification via electronic mail with a link to complete the survey, which will take 15 minutes to complete. Although we have asked faculty members to complete several other surveys in recent months, I encourage you to view this one as a special opportunity to share your opinions and insights about how we can make Stanford the best place for you to accomplish your best work. Responses are confidential and only de-identified aggregate data are included in data reports. Through the survey process, we hope to refine our understanding of what drives job satisfaction among our faculty so that we can target our improvement efforts most effectively. Thank you for taking the time to complete the survey.

Further Updates on School of Medicine Financial Planning

On Friday, March 20th, Marcia Cohen, Senior Associate Dean for Finance and Administration, provided the latest in our series of updates on how the economic downturn is affecting the School of Medicine. I know this is a topic that is on everyone's mind, particularly with my announcement in the last issue of the Dean's Newsletter ([url](#)) that compensation will be frozen for faculty and staff in FY10 (which begins September 1, 2009). I want to underscore that we are doing all that we can to preserve programs and positions, and I am very aware that there is considerable anxiety about whether there will be layoffs in the medical school. Of course our primary goal is to minimize layoffs as much as possible, and to reduce expenses first that do not impact employment, but some layoffs will be necessary to bring our expenditures into balance with our resources.

The reality is that we are experiencing the worst economic downturn in more than 50 years. Not only is the endowment now down more than 30%, but also the impact of its rapid decrease will be experienced for a decade. That is, unless the conditions change (i.e., further voluntary reductions in the endowment payout are made now to preserve its principal or a dramatic economic recovery takes place, which seems implausible), the annual endowment payout to the School will be less than in 2008 until approximately 2018. Looked at this way it is clear that the current economic downturn is having not only an immediate impact but one that will endure for nearly a decade. And even that scenario is contingent on some economic recovery by 2010. Should that fail to happen - or if conditions worsen - then even these serious projections will worsen still.

And while these scenarios are very distressing, I want to point out again that compared to other schools at Stanford, the medical school is less dependent on income from endowment - since a much greater proportion of our revenues comes from sponsored research and clinical income. Accordingly, the programmatic reductions or changes we will be making are less immediate than what is happening across the rest of the Stanford campus. That said, it is imperative that we plan carefully and responsibly - and that we anticipate that the situation we are in can worsen (even while we hope that it improves).

Let me give you some sense of the immediate impact on our current and projected financial status based on the presentation that Marcia Cohen gave to our Executive Committee. For FY09 (the current budget year) the consolidated income for the School of Medicine, from all sources, was \$1.12 billion. For budgeting and planning purposes we

generally compartmentalize the school into three groupings: the central activities sponsored by the Dean's Office (e.g., student services, research management, information technology, facilities management, development, etc.), the basic science departments and the clinical science departments. For perspective, the Dean's Office's revenues in FY09 are \$272 million - or about 25% of the school's income. Based on changes already in play, we now project that we will experience a \$22.2 million reduction in Dean's Office revenue for this current fiscal year (which we are now half way through), and there will be an additional revenue shortfall of \$14 million for FY10 - and an even larger impact on the Dean's Office programs because of the combination of lost revenue and increased expenses. In fact, for FY10 we now are forecasting a \$28 million negative impact on the Dean's Office operations.

As you know from prior reports, we have already instituted a number of budget savings measures, but they will not be enough given the continued negative impact we are experiencing. Accordingly, we will be putting into place a number of other cost reductions and programmatic changes - a number of which will be spread through the school. These will include some simple things, such as the frequency of mail delivery, housekeeping, landscaping, etc as well as reduction of services (e.g., library hours) or events (even though we have already been careful with events and fully recognize that it is important to hold some for morale, community building, fundraising, etc.). One important thing we can all contribute to is energy savings. For example, simply being more conscious of switching off lights and computers, swapping out old for newer freezers, etc, could have a significant impact - and is good for the environment in any event.

We are working hard to sustain commitments that we have made to faculty, chairs, departments and programs - but we will need to lengthen the time during which they are paid out. We will also need to delay a number of capital projects and be particularly mindful of reducing or minimizing debt funding. We are currently planning reductions in the operating dollars we distribute to departments, institutes, centers and programs - likely by around 7%. We also discussed with the Executive Committee the fact that the Dean's Office will not be able to cover some of the faculty housing benefits it has historically borne and that these will be shifted to the responsible departments. We project that the impact of these changes on our academic departments will be a negative \$3.7 million in FY09 and \$10 million in FY10.

As a result, we have asked our administrative units, Institutes and Centers to accelerate the budget preparation process for FY10 and to propose further budget reductions, including potential reductions in workforce. We will not have the final decisions and budget approvals from the University until late May. However, I want to inform you of the seriousness of the possibilities related to these budget reductions and the significant impact of the economic downturn on the School of Medicine. We are mindful that any decisions to reduce staff through layoffs will have a profound impact, and we want to be thoughtful and fair in considering such decisions. The School is most fortunate to have a very hard-working, talented and dedicated staff. We will not make decisions to reduce the workforce lightly, and I recognize that we are asking much from faculty and staff who

are already working diligently to contribute to our missions. As we eliminate some positions, we are equally aware of the effect of layoffs on the morale and engagement of the staff who remain and the need to support remaining staff. That said, administrative layoffs due to budgetary constraints will be informally communicated to all affected individuals at the very end of May with formal notification on June 1st. For those individuals receiving layoff notice, the last workday of paid notice will be August 31st. The University has enhanced the layoff benefits for all Stanford employees laid off during this notice period and that will provide some additional support to these employees.

What is not yet clear is how increased funding from the NIH stimulus will affect our budget forecasts. Knowing the total amount of NIH dollars that will be allocated to research (\$8.2 billion) and the historical share of NIH dollars that Stanford has received, we have done some projections of the levels of funding that might be anticipated. There is no doubt that this funding will be of enormous support to faculty and to the school in the short run - through 2010. But it would be unwise and imprudent to forecast a significant increase in sponsored research beyond 2010. More importantly, we need to anticipate – at least for planning purposes - that our funding will decline after that time. Should that change, we can reforecast – but it is much wiser to be fiscally conservative in our forecasts at this point, given all that has transpired in the past six months and that could remain the same or even continue to decline over the next year or more.

The bottom line is that we continue to experience unprecedented fiscal challenges. To date I think we have dealt with them thoughtfully and responsibly - and we have done our best to support our faculty, students and staff first and foremost. At the same time, we need to be vigilant and prepared to make additional and even unwelcome choices. Further, we need to stay focused on preserving and sustaining our missions so that we can preserve the great things about Stanford for future generations.

Responding to the Stimulus

I recognize that you have been receiving lots of communications about the funding opportunities being announced virtually daily by the NIH as part of the American Recovery and Reinvestment Act (ARRA) of 2009. While the sheer volume of these announcements is certainly daunting, we are doing the best we can to make you aware of opportunities, their timelines and ways that we might assist you. This past week Mario Garcia and Jeanne Heschle from the Research Management Group put together what I think is an incredibly helpful resource. They summarized all of the offerings by NIH Institute that are part of ARRA and provided links to the NIH website to help facilitate, organize and simplify your access to critical information. This spreadsheet was distributed broadly in the past several days, and it is available at <http://med.stanford.edu/rmg/funding/>. Importantly, Jeanne informs me that it will be updated regularly as new information becomes available.

Given all that is going on, I hope and anticipate that a large number of our faculty will be successful in one or more of these opportunities. But with success will come an unprecedented level of accountability – in this case to the public, the NIH and the White

House as part of the reporting required through <http://www.recovery.gov>. The website notes that federal agencies will be reporting their competitive grants and contracts on May 20, 2009 and that recipients of federal funding will begin reporting on their use of funds starting July 15, 2009.

While the actual information required will be established by each agency (in this case the NIH or NSF), there will be certain basic requirements. Based on information from the Office of Management and Budget (see: http://www.whitehouse.gov/omb/assets/memoranda_fy2009/m09-10.pdf), we understand that quarterly reports containing the following data elements, as prescribed by the Recovery Act, will be required:

- The project and Principal Investigator
- Evaluation of the completion status of the project (NB – this has not been further defined as of yet)
- Estimate of the number of jobs created and the number of jobs retained by the project
- Reports of any subcontracts

We are told that the quarterly reports will be quite detailed, but the complete content has not yet been made public. That said, one of the most important features will be the number of jobs created or retained, as noted above. Because our success as a national scientific community in utilizing the ARRA support – and how this impacts on the economy in new or retained jobs – will almost surely affect future funding from NIH, it is imperative that we do the best job possible with the reports as well as with the scientific achievements.

Public Transparency on Industry Relations

I have had numerous communications with you regarding academic-industry relationships and the steps we have taken to create transparency and integrity, for individuals as well as institutions. Stanford has been in the forefront in developing policies that address academia-industry relations in education, research and patient care (see: <http://med.stanford.edu/coi/>). In addition to doing all we can to assure the integrity of our programs in these areas, we have tried to foster and renew public trust in Stanford Medicine. Transparency is a key feature of ensuring the trust of our community – including our students, fellow colleagues and all whom we serve. The importance of transparency was evidenced by the recent events at Harvard Medical School (see <http://www.nytimes.com/2009/03/03/business/03medschool.html?scp=1&sq=harvard%20medical%20school&st=cse>), where students became concerned about whether the content of faculty presentations were free of bias due to undisclosed industry relationships.

Our faculty are required to disclose all financial relations with industry on an annual and transactional basis. Recently a number of pharmaceutical and device companies have announced that they will voluntarily post all payments to doctors for speaking, consulting and related activities on publicly accessible websites. This has been legislated in some

states (e.g., Minnesota and Vermont), and Senator Charles Grassley (R-IA) is sponsoring legislation (the Physician Sunshine Act) that would require the pharmaceutical and device industries to disclose all payments to doctors. This has been driven, in part, by allegations and evidence that some physicians have either failed to disclose or have incompletely disclosed their financial ties with industry – an issue that has been widely reported in the media.

In December 2008 the Cleveland Clinics took the additional step of indicating that it would disclose the financial ties of its 1800 doctors and scientists on its web site (www.clevelandclinic.org). This was widely covered in the press, including the December 2nd New York Times (see: http://www.nytimes.com/2008/12/03/business/03clinic.html?_r=1&scp=2&sq=cleveland%20clinic%20and%20conflict%20of%20interest&st=cse). This was a bold step, and it prompted Dr. Harry Greenberg, Senior Associate Dean for Research and me to assess the value and utility of this approach. This involved discussions with Dr. Guy Chisolm, Chair of the Conflict of Interest Committee at Cleveland Clinics, and others about the feasibility of adopting a similar level of transparency at Stanford.

At Stanford, thanks to the Community Academic Profile (CAP) web-based system developed by Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and his colleagues (see: <http://med.stanford.edu/irt/web/cap.html>), the academic and clinical profiles of our faculty (and now post-doctoral fellows) are publicly searchable through the School of Medicine as well as Google search. For example, my profile is: http://med.stanford.edu/profiles/Philip_Pizzo/. If you are in the School of Medicine your profile can also easily be found. The CAP system has been a great resource for the university community and the public to find areas of research and clinical interest and expertise. It also serves faculty by automatically searching the literature for new publications and updating their bibliographies.

Since our annual faculty reporting of conflict of interest disclosures is also a web-based system, we determined that it would be possible to import disclosed industry relations from this system to each individual's CAP profile. This would permit the School of Medicine to make publicly transparent all of the disclosed industry relations of its faculty. As noted, this can be done automatically from the annual disclosure each faculty member is already required to make. The proposal to publicly disclose all faculty financial ties with industry or other entities related to their professional activities that are greater than \$5000 using the CAP profile was presented to the Executive Committee on March 20th and received strong endorsement. We will now proceed to implement this public disclosure process, and I wanted to make you aware that this will happen in the next several months. Faculty will shortly be asked to file their required annual disclosure – which will include all relations with industry, including membership on an advisory board or service on a board of directors, consulting (including medical legal/expert witness, investment companies), executive or employee positions and payments by industry to a spouse or domestic partner. This information will serve as the source for information included in the faculty CAP.

We are finalizing the format for how this information will appear in CAP. Currently we anticipate that there will be a boilerplate statement (see below) followed by the specific disclosure information. While not yet final, the likely language for the boilerplate will be something like:

Stanford physicians and scientists may interact with the pharmaceutical, biotech, or medical device industries to help develop new medical drugs, devices or diagnostics or to provide medical education about health care related topics of mutual interest. These interactions are reviewed annually as part of Stanford University School of Medicine policy. It is our policy to disclose payments to physicians and scientists employed by Stanford University for speaking, consulting, and other interactions of \$5,000 or more, and any equity, royalty or Board of Director relationships with companies or other commercial entities with which they interact as part of their professional activities. In providing this information, Stanford wants to be as informative and transparent as possible concerning its faculty's interactions with industry. The following relationships have been reported with the companies listed below during the calendar year 2008. To learn more about Stanford's policies on collaborations with industry go to <http://med.stanford.edu/coi/>

This will be followed by faculty specific disclosures in the following categories

Consulting: *Dr. ____ receives fees of \$5,000 or more per year as a paid consultant or speaker for the following companies:*

Royalty Payments: *Dr. ____ has the right to receive royalty payments for inventions or discoveries related to the companies shown below:*

Equity: *Dr. ____ owns stock or stock options in the following companies for activities as a founder, inventor, or consultant:*

Board of Director Role: *Dr. ____ serves in a fiduciary capacity, such as an officer or director, for the following companies or other entities:*

It is our hope that in addition to engaging the public trust, this proactive public disclosure practice will permit faculty to avoid false perceptions or allegations – as recently discussed by the editors of JAMA (see:http://jama.ama-assn.org/misc/jed90012pap_E1_E3.pdf) or that led students at Harvard Medical School to speculate about the integrity of their teachers and educators. Since the information we will be posting is comparable to what faculty would disclose for an educational program or for a journal publication, it is appropriate to make it publicly available and accessible. In my opinion, this is the right thing to do – a position that is shared by our School leadership.

The 2009 Match

On Thursday, March 19th some 29,890 applicants to the National Resident Matching Program (including 83 from Stanford) learned where they will begin their internship and residency this summer. This was the largest “match” in history, and the applicants included 15, 638 from US medical schools. The remaining applicants were from international medical schools (10,874), osteopathic schools (2,015) and physicians who previously graduated from medical school (1,222). Collectively these applicants applied for 22,427 first year residency positions available through the Match.

Of our 83 Stanford graduating students who took part in the Match, 30 will graduate in four years and 53 (64%) in five or more years. The residency choices of our students vary from year to year and reflect, in part, national trends. This year 16 students will begin their residency in internal medicine (including one in a combined medicine/emergency medicine program and one in a combined medicine/preventive medicine residency). Ten students selected diagnostic radiology, six chose pediatrics, six, emergency medicine (including the one in combined medicine/emergency medicine program); five chose ophthalmology, orthopaedic surgery or dermatology, and four chose otolaryngology or neurological surgery. Three each matched in radiation oncology, psychiatry or anesthesia and two each in obstetrics/gynecology, family medicine or pathology and one each in general surgery, physical medicine & rehabilitation or plastic surgery.

The choices of our students mirrored, in part, those of US graduates – of whom a fifth chose internal medicine through the Match. The “most competitive” specialties on a national basis were dermatology, neurological surgery, orthopaedic surgery and otolaryngology. How students make these choices is the topic of a new report from the Robert Graham Center, with support from the Josiah Macy Jr. Foundation, entitled *“Specialty and Geographic Distribution of the Physician Workforce: What Influences Medical Student and Resident Choices?”* (see: <http://tinyurl.com/cq28nv>). It seems hard to leave California and the Bay Area, as evidenced by the fact that 39 (47%) of our graduates will stay in the Golden State, including 21 in various Stanford programs. Eighteen students will move to New York (8), Massachusetts (7) or Maryland (3). Following is the list of students and the residencies they will be pursuing. I have listed in bold the final destination; for those who need to first do a preliminary or transitional year, which I’ve noted in italics.

I want to congratulate our 2009 graduating students. They have done superbly in the residency programs they have selected for the next phase of their training. In addition I also want to congratulate all of the Program Directors and Chairs of our Clinical Departments for the outstanding success they have achieved in their Match at Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital.

Upcoming Event: East-West Alliance Conference on Longevity

The East-West Alliance is a global network of ten institutions, including the Stanford University School of Medicine, that have been supported by the Li Ka Shing Foundation. The Alliance convenes annually at one of its member institutions to address significant scientific issues at a public conference. The School of Medicine is this year's host.

The focus for the 2009 conference is longevity across the life span. The Alliance, the Stanford Center on Longevity and the School of Medicine have brought together leading experts across a broad range of disciplines to address longevity-related topics in their fields. Session themes will include genetic considerations of longevity, stem cell connections to longevity, social correlates of longevity, longevity implications for the medical workforce, and economic correlates of longevity. Dr. Laura Carstensen, Professor of Psychology and Fairleigh S. Dickinson Jr. Professor in Public Policy; Director, Stanford Center on Longevity, will give a plenary address on "Longevity in the 21st Century." Session moderators will include Stanford faculty members Dr. Stuart Kim, Professor of Developmental Biology and of Genetics and, by courtesy, of Chemical and Systems Biology; Dr. Tom Rando, Professor of Neurology and Neurological Sciences, and Deputy Director, Stanford Center for Longevity; Dr. Paul Wise, Richard E. Behrman Professor in Child Health and Professor, by courtesy, of Health Research and Policy; Dr. Ralph Horwitz, The Arthur L. Bloomfield Professor of Medicine and Chair of the Department of Medicine; and Dr. John Shoven, the Charles Schwab Professor of Economics and Senior Fellow, by courtesy, at the Hoover Institution.

East-West Alliance 2009 Conference on Longevity**Wednesday, April 15**

1:30 pm – 4:30 pm

Clark Center Auditorium

Thursday, April 16

8:30 am – 11:30 am

1:00 pm – 5:00 pm

Clark Center Auditorium

Admission: Free. Open to the public**For more information** contact Mira Engel, mengel@stanford.edu**Stanford Postdoctoral Mentoring Award**

The Stanford University Postdoctoral Association is pleased to announce that nominations for the 2009 Stanford Postdoctoral Mentoring Award will be accepted until April 24, 2009. The award aims to raise awareness of the importance of quality mentoring and will recognize faculty or scientific staff who are excellent mentors. Please nominate any Stanford University faculty member or scientific staff who has provided

beneficial mentoring to you during your postdoctoral fellowship, they need not be your primary advisor.

More information: www.stanford.edu/group/supd/award

Nomination deadline: Friday, April 24, 2009

Award prize: Two prizes of \$2,500

Applications for the ARTS Program are Invited

Current Stanford residents and clinical fellows interested in combining clinical training with advanced research training are invited to apply to the Advanced Residency Training at Stanford (ARTS) Program (see: <http://med.stanford.edu/arts/> for more details).

The ARTS program offers the opportunity to obtain a PhD degree during or upon completion of residency or clinical fellowship. The program begins with approximately 12-48 months clinical training toward board certification in any area of interest, followed by research training in a graduate program in the Schools of Medicine, Engineering or Humanities and Sciences at Stanford University. The ARTS program will provide tuition, stipend and health benefits to successful applicants. Dr. Sam Gambhir, Professor of Radiology and Bioengineering, is the Program Director. The application deadline is October 5, 2009 for applicants who seek to begin their PhD coursework in the Fall of 2010.

If you are interested please contact Dr. Gambhir (sgambhir@stanford.edu) directly or the ARTS Program Office for more information. You can also call (650) 724-9139 or email: sofias@stanford.edu

Awards and Honors

- **Howard Hughes Medical Institute** has named three Stanford faculty as Early Career Scientists. This is a new award from HHMI for which 50 outstanding individuals were selected from more than 2000 applicants. The competition was enormously stiff and sought individuals who could develop their best ideas early in their careers with six years of funding from the HHMI. The three Stanford faculty selected for this highly prestigious award are:
 - **Howard Chang, MD, PhD**, Associate Professor, Department of Dermatology
 - **Karl Deisseroth, MD, PhD**, Associate Professor, Department of Bioengineering
 - **Tirin Moore, PhD**, Assistant Professor, Department of Neurobiology

That three of the 50 recipients of the HHMI Early Career Scientist Award are at Stanford is remarkable and reflects on the incredible talents of these individuals – and also on the wonderful environment that Stanford offers for innovative science. Details about each of their areas of research can be viewed at:

http://med.stanford.edu/news_releases/2009/march/hhmi.html. Please join me in congratulating Drs. Chang, Deisseroth and Moore.

- **Dr. Howard Chang, MD, PhD**, Associate Professor, Department of Dermatology, has also been awarded one of the first two Creative Promise Prizes by the Vilsek Foundation. This Prize recognizes talented foreign-born artists and scientists who have demonstrated significant creativity and originality in the early stages of their careers. Congratulations to Dr. Chang (again!).
- **The Stanford Digestive Disease Center**, a long standing NIH-funded (P30) research Center program based at Stanford University and the Palo Alto VA involves investigators from ten departments in the School of Medicine and one in Engineering. Under its PI/Director, Dr. Harry Greenberg, the Center has chosen its five new Pilot/Feasibility and Named Investigator Awardees for 2009-10, after a highly competitive selection process.

The Pilot awardees are:

1. **Chang-Zheng Chen, PhD** -- Assistant Professor, Microbiology & Immunology (*Project: The Role of miR-181 Family Genes in Inflammatory Bowel Disease*)
2. **Shirit Einav, MD** -- Postdoctoral Fellow, Medicine/Infectious Disease (*Project: Novel Antiviral Targets in Hepatitis C Virus NS4B Protein*)
3. **Eric Humke, PhD** -- Postdoctoral Fellow, Oncology & Developmental Biology (*Project: A Novel Paracrine Hedgehog Signaling Loop in Pancreatic Adenocarcinoma*)
4. **Maxence Nachury, PhD** - Assistant Professor, Molecular & Cellular Physiology (*Project: The Primary Cilium: A Tumor Suppressor Organelle for Pancreatic Ductal Adenocarcinoma*)
5. **Juergen Willmann, MD, PhD** -- Assistant Professor, Radiology (*Project: Non-invasive Molecular Ultrasound Imaging for Diagnosing and Monitoring Inflammatory Bowel Disease Using Molecularly Targeted Microbubbles*).

The New Named Investigator is:

Hanlee Ji, MD -- Assistant Professor, Medicine/Oncology

- **Chandler Robinson**, a 2nd year medical student, is one of 37 Americans to be named a Gates Scholar by the Gates Cambridge Scholarship Program, which provides funding for one to four years of graduate study.

Appointments and Promotions

- **Megan A. Albertelli** has been appointed to Assistant Professor of Comparative Medicine at the Veterinary Service Center, effective 3/01/09.
- **Valerie Berry** has been reappointed as Clinical Assistant Professor of Medicine, effective 7/01/08.
- **Ramin E. Beygui** has been appointed to Associate Professor of Cardiothoracic Surgery at the Stanford University Medical Center and at El Camino Hospital, effective 3/01/09.
- **Yair Blumfeld** has been appointed as Clinical Assistant Professor of Obstetrics and Gynecology, effective 7/01/09.
- **Walter Cannon** has been reappointed as Clinical Professor of Cardiothoracic Surgery, effective 10/08/08.
- **Chang-Zheng Chen** has been reappointed to Assistant Professor of Microbiology and Immunology, effective 6/01/09.
- **Eric I. Hsiao** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 1/01/09.
- **Sermsak Lolak** has been appointed as Clinical Assistant Professor of Psychiatry and Behavioral Sciences, effective 5/01/09.
- **Christopher A. Longhurst** has been reappointed as Clinical Assistant Professor of Pediatrics, effective 4/01/09.
- **Padma Mallipeddi** has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 4/01/09.
- **Nhat M. Pham** has been promoted to Clinical Assistant Professor (Affiliated) of Medicine, effective 11/01/08.
- **Jodie Trafton** has been reappointed as Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 4/01/09.
- **Brendan Visser** has been appointed to Assistant Professor of Surgery at the Veterans Affairs Palo Alto Health Care System, effective 3/01/09.
- **Paul Wang** has been reappointed to Professor of Medicine at the Stanford University Medical Center, effective 3/01/09.
- **Dhyanne Warner** has been appointed as Clinical Professor of Psychiatry and Behavioral Sciences, effective 4/01/09.

Prospects for Healthcare Reform in the US: Some Personal Observations and Reflections

In the midst of all the dire news about the current economic meltdown, commentaries and forecasts by the Obama administration and others have earmarked healthcare reform as critical to our ultimate economic recovery. There are many reasons to reform healthcare in the US, but the major one driving the Obama administration is that the rising costs are unsustainable. For example, in February the Centers for Medicare and Medicaid (CMS) released a 10-year projection that showed that healthcare expenditures would rise from 16.2% of the gross domestic product (GDP) in 2007 to 17.3% in 2009 and then to 20.3% by 2018. Some projections indicate that, if this pattern continues unchecked, healthcare would consume the entire GDP by 2050. Clearly controls and reductions in healthcare expenditures are critical.

Debates about healthcare reform have gone on for decades, and several attempts to create a functional healthcare system in the US have failed, largely because of the lobbying and political maneuvering of various special interest groups – including doctors, hospitals, the insurance industry, pharmaceutical and device manufactures, and the business community, among others. Two factors seem to be converging that forecast some reform in the next year or two: first, the continuing rise in health care costs as noted above, and second, in a related way, the impact that these escalating costs are having on large and small businesses throughout the nation – a matter made far worse by the global economic crisis.

In addition to following with great interest the information and commentaries about pending healthcare reform in print and visual media, I have witnessed some of the debate first hand over the past couple of weeks through the lens of several events I have participated in quite directly. These include a meeting on health care reform at the White House to which I was invited along with other leaders of medical institutions and professional organizations; a discussion at the Board of Directors meeting of the Association of Academic Health Centers and the 2009 international forum that it sponsored; a special retreat of the Council of Deans that focused on the changes that will likely ensue with significant healthcare reform as well as the current economic crisis; and a dialogue at the Council of the Institute of Medicine. Distilling and synthesizing some of the viewpoints, observations and facts discussed and presented at these events and at others during the past weeks lead to several general deductions – which I readily admit I will convey through my own personal lens. While each point can be discussed and debated in detail, I thought it reasonable to share just some high level assessments – since I think they best set the stage for some of the changes that may occur over the next months to years.

- It is important to begin with a qualifier. While many experts and pundits believe this is the moment in history for significant healthcare reform, it must be underscored that we have come up to the edge of reform in the past and backed away. Of course the current economic forecasts and chaos as well as what seems to be a greater willingness of the major and often opposing constituencies to at least come to the table seem to be harbingers for reform. But whether this will be marginal, incremental or transformative remains to be seen.
- At least as expressed at the White House meeting I participated in, the three driving areas of focus are cost containment, enhancing quality and improving access. Of course these are interrelated and intersecting. However, I would say that cost containment is the overarching and driving mandate.
- Controlling costs and reducing healthcare expenditures cannot be accomplished without major shifts in the provider-payer community, and these will affect every sector of the healthcare environment. The degree of impact will be influenced of course by the rate of change and the areas of primary focus. But it seems unassailable that every service, profession, and industry will be affected in some way – some more significantly than others.
- That said, it must be quite clear to everyone that significant change will not occur easily. Each sector and industry will have its own debates. Take the medical profession as an example. In principle everyone wants reform. But if cost containment means changes in physician compensation (which seems inevitable), there will be fierce debates about whose compensation goes up or down, since the total amount of healthcare dollars available for physician payment will almost surely decline. This was evidenced at the White House meeting I referred to above, at which specialty groups acknowledged that payments for primary care doctors were low and should increase – but not at the expense of payments for specialists. Clearly this math won't work.
- Several professional organizations have forecast a significant shortage in the physician workforce in the next decades, made worse by the aging of the population. This has led the AAMC to promote a 30% increase in the size of medical school classes in order to produce more doctors for the 21st Century. While there will surely be shortages in selected areas and disciplines, it is not clear to me that increasing medical school class size will change this projected shortages. Most notable is the relative shortage of primary care physicians, of which the US has a lower proportion than any other developed nation. In fact, as I have written about frequently, this trend is increasing over time for a complex variety of intersecting events.

Among these are the choices of medical school graduates, who more than ever are seeking careers that balance work and family. This has led many graduates, including the very best students, at least academically, to choose career paths like dermatology, radiology, anesthesia, and surgical subspecialties rather than

primary care. This trend is made worse by the cultural perception around primary care as the “lost leader” that does not command the respect or remuneration of other specialties. In fact, the lower compensation for primary care and cognitive specialties is a significant factor influencing medical school graduates – as well as the career satisfaction of physicians in practice. These choices are also influenced by the rising costs of medical school indebtedness (now over \$180,000 for private medical schools, although Stanford continues to have the lowest amount of indebtedness of either public or private medical schools), which affects the decision of whether to pursue a lower paying primary care career or a higher paying specialty pathway.

- Given that the choice of primary versus specialty care is influenced by multiple factors and that there are approximately twice the number of ACGME approved residency positions as there are graduates of the 130 allopathic medical schools, it is likely that simply increasing the number of medical school graduates will not necessarily change the career choice or the ultimate geographic workplace of medical school graduates. Simply put, just increasing medical school class size will not solve the primary care workforce. While some are talking about doing this by altering the distribution of CMS funded residency slots between primary and specialty care, it is unlikely that this will be successful unless compensation for primary care physicians is addressed.
- Further, it is not clear that doctors are the only or even the correct solution to the primary care challenge we face today. From my perspective, the primary care needs of the nation can only be solved if doctors join forces with other health professionals – especially with nurses who have advanced degrees (including nurse practitioners and the newly created Doctor of Nursing Practice). This will mean more cooperation among physician and nursing professionals (and their schools and organizations) as well as more team based education and practice.
- Health care providers will be increasingly judged and paid on quality metrics, a process already underway. This will include payments to doctors as well as hospitals. Increasingly, evaluations of physician performance will be made more publicly available, including on the web.
- Solving the access problem (especially for the 40 million American uninsured or underinsured) will require a number of changes. These include changes in public and private providers and almost certainly a requirement/mandate that everyone must have healthcare coverage. For those who can’t afford private insurance, a public system (analogous to Medicare) has been proposed. This is one of the more controversial and politically challenging areas for discussion. Because a large public payer will have the power to negotiate for lower prices and to offer coverage at a lower cost, it would seem inevitable that many individuals will migrate from private to public insurance. This has many concerned that the insurance industry as we know it today will become marginalized and the public system will grow – as is the case in most other nations.

Presently, Medicare (or public funding) accounts for about 50% of health care coverage. If a public system allowed this to increase to 75% or more over time, it would radically reshape the health care environment – moving it from an employer based model to a single payer system. I have previously registered my own support for a single payer system, even though I know it would pose a number of challenges to academic medical systems. In a small way, this was part of the debate around SCHIP during the Bush administration – and SCHIP has now been passed by the Obama administration. It is clear that, however it is accomplished, dealing with access is a key component of reform – but achieving this in a way that both sustains quality and achieves cost containment is also critical.

- Cost containment will focus attention on the perverse incentives that drive US medicine and healthcare. The fact that doctors and hospitals are paid more for procedures and technologies does just what you'd expect. It increases the use of technology, not a small amount of which is unproven, as well as high-end procedures and surgeries. There is ample data demonstrating that more medical care, including spending more on healthcare, is not associated with improved outcomes. In fact, in certain sectors there is an inverse relationship. But because market forces have driven medicine and healthcare, doctors, hospitals and health care systems have focused both on those services that provide higher reimbursements and on the payer mix of patients – which not infrequently means increasing the proportion of selected private insurance payers. The actual mix varies among and within states, but the guiding strategies are the same. They account for why community hospitals become competitive with larger tertiary facilities and may even include patient selection as part of the strategy. In many ways the current payment schedules have created the incentives that now drive healthcare costs. They need to be changed, but doing so will be accompanied by significant opposition and challenge.
- Part of the perverse incentives includes the cost of drugs, devices and technologies. There is no doubt that major advances in healthcare outcome are the result of new drugs, innovative medical devices and sophisticated technology, especially in imaging. But many of these new innovations are unproven and costly and are applied with as much of an eye toward profit as toward outcome. While we would like to think that clinical trials and the peer reviewed medical literature set a standard of excellence, it is quite clear that in many cases they do not. Even worse, in some egregious instances doctors and industry have promoted advances in care or diagnosis for personal or institutional profit. Even when bias has been unintended, the need for profit by industry as well as hospitals and doctors has resulted in some unfortunate examples of personal and institutional conflict of interest.
- A likely key part of the solution to controlling medical costs for new technologies and drugs will be a health oversight board – something also being discussed by

the Obama administration. In the absence of regulation, market forces and persuasion rather than data influence the introduction of new procedures, drugs, and devices. Significant improvements in the assessment of health outcomes and the benefits from a whole variety of interventions are viewed as another way of controlling costs. But it must be also acknowledged that gathering reliable health outcome and cost data is not as easy as it may sound. But such data are very much part of the potential remedy for health care.

- Another major remedy being discussed is the electronic healthcare record. It is amazing to note the low number of physicians and hospitals now using an EMR, and there is no doubt that a functional EMR will improve data access, quality monitoring and outcome, reduce errors, and improve portability of healthcare information. It also carries a number of risks regarding patient confidentiality and security and, we all recognize, it is expensive. There is a debate about whether an EMR will actually reduce healthcare costs as some in the Obama administration have forecast. But there can be no question that it is an essential part of a more functional healthcare system. I have been told by some of my colleagues that the EMR being used in the United Kingdom is highly effective – but it is important to note that this has been built on a reasonably functional (certainly as compared to the US) healthcare delivery system – which is what we do not have. In any event, significant dollars are being expended in the American Recovery and Reinvestment Act (ARRA) to foster development of an EMR, so it is likely that progress will be made in this domain.
- Unlike other nations, there are few if any constraints on healthcare tests and procedures for those with insurance. The debate about whether we can afford to spend so much of the health care dollar during the last 6-12 months of life will be an important one – with individual and societal ethical issues to be resolved. Indeed, discussion about the levels and extent of care provided at both ends of the life cycle seem inevitable, although I suspect that these will not be part of the initial dialogue about healthcare reform in the next couple of years. That said, this is an area where new technology may have a beneficial effect in moving the locus of care from institutions to home – and this could be an important area of focus for Stanford, given the close partnership that the Medical School has with the School of Engineering.
- Appropriately, the Obama administration has placed increased focus on health, wellness and prevention as remedies for controlling costs as well as for improving the quality of life. This is an important issue and it deserves attention. There are clear data showing that exercise can reduce morbidity and mortality from cardiovascular disease. And there is clear evidence that obesity in children, adolescents and adults, which is increasingly prevalent, increases the risk for a number of chronic medical conditions and so needs to be addressed. These and a plethora of other wellness strategies deserve attention, as we have been a nation and system more focused on disease management than health maintenance. That said, the data demonstrating that preventive health will have a major impact on

healthcare costs are unclear at this point. But wellness is worth our focus independent of costs.

- Each of the meetings I referred to and virtually every other discussion on healthcare I have participated in has also identified the need to better address the management of individuals with chronic disorders. The market-based health care system we have today does not align to the care of this important patient population. Because they take more time and resources, they are frequently triaged or avoided by many health care providers, which ultimately results in poorer care and greater costs.
- Except for research on health outcomes and cost, almost all of the discussions about healthcare reform are silent on the subject of biomedical research. Not surprisingly, the discussion at the Council of Deans last week made this connection quite clear and underscored the importance of basic and clinical research in improving future healthcare outcomes and in effecting cost containment. This is two-edged, since new discoveries can also increase costs if they are implemented and paid for before there is evidence that they are real advances in the healthcare armamentarium. But there can be no doubt that research in the basic biosciences and in clinical and translational science is a fundamental underpinning of a future healthcare system.

These are some of the observations, recommendations and issues that seem to be unfolding in the current healthcare reform debate. While it is difficult to determine which of these will emerge as leaders of the change process, it seems clear that the focus will be around cost containment. The obvious implication for all of healthcare, including academic medical centers like Stanford, is that the clinical revenue to physicians and hospitals will decline in the years ahead – at least proportional to the patterns that have been witnessed in the past decade. While these changes have been increasingly inevitable, they have been dramatically increased by the economic meltdown of the last year. This has made the call for change, and the likelihood that it will take place in the next couple of years, more likely than ever before.

Obviously our challenge is to do what we can to participate in the debate and discussion on healthcare reform as well as to prepare for its consequences. Sustaining flexibility, avoiding fixed overhead expenses, seeking the right balance of our missions, including the size and focus of our faculty and staff, will be critically important. That we have been engaged in proactive planning over the past years is a benefit –but we need to recognize that our prior planning will almost certainly require adjustment and accommodation as things unfold in the immediate future.

At the same time, we also need to do all we can to communicate what we bring to the nation's healthcare mission. Academic medical centers constitute only 2% of the healthcare providers, but they participate in the care of a significant percentage of the nation's sickest patients. They also train tomorrow's doctors and leaders as well as create the knowledge that can transform health outcomes. But in recent years we have lost some

of the public trust as academic medical centers have been caught up in allegations of financial avarice and in assertions that we have been inattentive to the real needs of the communities we serve. Clearly these issues also need to be addressed if we are to be players and future participants in healthcare reform and the future of medicine and science in the US.

Our Important Connections to the Santa Clara Valley Medical Center

The affiliation of Stanford and the Santa Clara Valley Medical Center (SCVMC) has a long and rich history grounded in a shared commitment to education (at both the undergraduate and graduate levels), patient care and research. SCVMC is presently a 574 bed facility with new and extensive ambulatory facilities whose history dates back to the latter part of the 19th century and whose affiliation with the Stanford School of Medicine began in 1959 – the year the medical school relocated to the Stanford campus. Since then it has developed important relationships with multiple residency programs at Stanford and has been an important and highly regarded site for medical student education

Over the years I have been at Stanford, Dr. Norm Rizk, the Berthold and Belle N. Guggenheimer Professor of Medicine and Senior Associate Dean for Clinical Affairs, and I have met at regular intervals with Dr. Alfonso Banuelos, Chief Medical Officer at SCVMC, and Dr. Dolly Goel, Medical Director there, to review shared programmatic initiatives in education, clinical programs and community initiatives. On Thursday April 2nd, thanks to an invitation from Dr. Clifford Wang, President of the SCVMC Medical Staff, Dr. Rizk and I had the opportunity to attend their medical staff meeting.. In addition to their reports, Ms. Kim Roberts, CEO, gave an update on the federal, state and community issues impacting SCVMC. While there are differences between the issues that Stanford is facing and those at SCVMC, there are some commonalities as well. Accordingly, I gave an overview of the impact of the current economic downturn on our missions in education, research and patient care, and I also discussed how we are addressing these issues in our efforts to stay focused on our overarching goals and strategic initiatives.

I am always impressed by the dedication of the physicians and faculty who work at SCVMC to the patients and community they serve. While the term “county hospital” can evoke many visual connotations, SCVMC is distinctive in having outstanding patient care facilities, including a new state-of-the-art ambulatory care center that opened in February and that we had the pleasure of touring. In addition, the SCVMC will soon break ground on a new in-patient bed tower that constitutes the next phase of their master facilities program. The impressive physical facilities convey to patients and their families that their community values them – which is precisely the right message, especially during these economically challenging times. Importantly, the excellence of these facilities is well matched by the commitment of the medical staff to patient care and to the very important and valued role they play in the education of our students and trainees. For this we must all be grateful and appreciative.

Introducing the Stanford Society of Physician Scholars

Virtually everyone who has gone through medical school and postgraduate education recognizes the lack of continuity and, in some cases, almost disconnectedness between clinical medicine and basic science – and between undergraduate and postgraduate medical education. We have made considerable efforts to address the connections between science and medicine in our New Stanford Curriculum, which commenced in the Fall of 2003 (see: <http://med.stanford.edu/md/>). Students begin learning the basic science and science of medicine from the start of medical school, and they continue that integrated learning throughout their undergraduate medical education. In the most simplistic manner, this fosters an understanding of the scientific underpinnings of clinical medicine – a goal espoused by Abraham Flexner when he issued his report on medical education nearly a century ago. We have also gone a step further with Stanford medical students by requiring that they each pursue a “scholarly concentration” that focuses them on scholarship and research and helps prepare them for lifetime learning.

But our efforts at integrating science and medicine are often lost with the start of residency and postgraduate education. The demands of patient care often leave little time to draw connections back to basic science. And most clinical faculty focus their teaching and interactions on patient management rather than discussions about the basis for disease at a fundamental level. Indeed, the pressures and demands on clinical faculty limit even their own ability to keep abreast of the scientific developments in their fields. While this might be a focus of “continuing medical education,” it too has been largely relegated to disease management and diagnostics and not to scientific integration.

As knowledge expands in science, and the demands of medical practice increase, the prospect that clinicians and scientists will draw even further apart in their shared learning is a real concern. At its extreme this could relegate clinical medicine to a “trade” rather than a science-based profession. Indeed the curtailed focus on basic science to shorten the time of training that has been proposed for some new medical schools could inadvertently widen this information divide.

For some years I have commented on the importance of drawing our programs and opportunities in undergraduate and medical education more closely together. And while we have made some progress, we have only barely achieved the kind of integration that would create new linkages for residents and fellows with medical and graduate students and the School of Medicine. On Friday, April 3rd, Dr. Charles Prober, Professor of Pediatrics and Senior Associate Dean for Medical Education, gave an update on a new program that can help foster better connections. It is modeled very loosely on a program at UCSF that Dr. Steve Galli, the Mary Hewitt Loveless Professor and Chair of the Department of Pathology, called to our attention. Building on that, Dr. Prober and his colleagues propose establishing the Stanford Society of Physician Scholars (SSPS), which would connect residents to medical school faculty, students and programs.

In this program, residents selected by their home department would participate in a seminar series that would provide guidance on career development, leadership and mentoring, research and funding strategies. The SSPS would provide mentors for the

resident as well as an expectation that residents would in turn provide mentorship for medical students. Drawing residents and students more closely together around scholarship, learning and teaching could foster important new synergies and opportunities. These could be connected to any of our Scholarly Concentrations (see http://med.stanford.edu/md/curriculum/scholarly_concentrations/) and thus create new alignments of undergraduate students and postgraduate trainees around areas of shared interest and opportunity. Importantly, it would also bring residents from different disciplines into a common forum and thus permit more interdisciplinary education and knowledge sharing.

The Stanford Society of Physician Scholars is still a concept but there is every intent to launch it this year and to further the process of better integrating our education programs across the continuum and hopefully, of improving the opportunities of postgraduate trainees to continue to link medicine and science.

Update from the Department of Radiology

On Friday, March 20th, Dr. Gary Glazer, the Emma Pfeiffer Merner Professor and Chair of the Department of Radiology gave an update on the department of Radiology to the Executive Committee. Over the past two decades Dr. Glazer and his colleagues have built what is unquestionably one of the most notable academic departments of radiology in the world. He provided the following summary of his presentation.

The Department of Radiology has created new clinical and research initiatives in medical imaging by investing heavily in people and resources to help solve major problems in health care and science. Deeply committed to patient care, Radiology faculty and staff provide service to Stanford University Hospital (SUH); Lucile Packard Children's Hospital (LPCH); the Palo Alto VA Hospital; and two new outpatient imaging centers: Stanford Medicine Imaging Center (SMIC or "Sherman"), Palo Alto, and Stanford Medicine Outpatient Center (SMOC), Redwood City.

As subspecialty experts, Stanford radiologists are very clinically active, performing nearly 1,000 examinations each day. Consequently, Radiology was the third largest producer of wRVUs in the School of Medicine (SOM) for fiscal year 2008. Dedicated to the growth of the SOM and the University, Radiology's combined revenues have grown by more than 580% since 1990 and over 50% since 2005. Radiology also provides very substantial revenues to our Hospitals through the technical fees for imaging.

In addition to its subspecialty clinical divisions, Stanford Radiology is divided into three major research sections: the Radiological Sciences Laboratory (RSL) headed by Gary Glover; the Molecular Imaging Program at Stanford (MIPS) headed by Sam Gambhir; and a new section called ISIS (Information Sciences in Imaging @ Stanford) co-directed by Sandy Napel and Sylvia Plevritis. Each of these sections is devoted to both basic and applied research. Norbert Pelc serves as the Associate Chair for Research and was a founding member of the RSL.

The Department has built bridges between the clinicians and scientists of Radiology as well as with other departments at Stanford. Today we collaborate with over 30

departments within the University. These collaborations have resulted in major advances, which have been rapidly translated into clinical medicine. Stanford is recognized internationally as a major epicenter for innovation in magnetic resonance imaging, fMRI, CT scanning, 3D image visualization, and in vivo cellular and molecular imaging. We are very pleased to house 3 major NIH funded Centers of Excellence: the National Center for Advanced Magnetic Resonance Technology; the In Vivo Cellular and Molecular Imaging Center at Stanford; and the Center for Cancer Nanotechnology and Excellence Focused on Therapy Response.

Radiology's research success is reflected in exceptionally strong NIH funding and its unique imaging infrastructure, which attracts trainees worldwide who come to study the latest imaging techniques at the Department's Richard M. Lucas Center for Imaging. As a result, the Department's educational programs have continued to expand, and the number of graduate students, postdoctoral scholars, residents, and clinical fellows has increased to over 150 in 2009.

Similarly, the Continuing Medical Education (CME) Program has grown to include more than 3,600 learners a year from 25 countries. Over the past few decades the Department has built strong partnerships with industry resulting in an imaging infrastructure that is world-class. For example, the multimodality small animal imaging lab, our high field MR equipment, the cyclotron and radiochemistry facility, and our leading edge CT scanners provide outstanding imaging resources to the Stanford community. We look forward in the years ahead to bringing breakthroughs in imaging and molecular medicine together to advance science and help in the earlier detection of disease and its personalized therapy.

Update from the Department of Pediatrics

Dr. Hugh O'Brodovich, the Arline and Pete Harman Professor of Pediatrics, became Chair of the department of Pediatrics on January 3rd, 2008. He presented an update of the department's demographics, vital statistics and strategic directions to the Executive Committee on Friday April 3rd. At the opening of his presentation he credited the significant growth in the department over the past decade to its past leadership and to the \$500 Million Children's Health Initiative (CHI). The CHI resulted from philanthropic donations from the David and Lucile Packard Foundation, Lucile Packard Foundation for Children's Health and the community. He provided the following brief summary of his comments.

The Department currently has 222 members. The changing demographics of the Department can be illustrated by several examples. First, the majority of the members are Clinician Educators (112), who are concentrated in the Divisions of General Pediatrics and Neonatology. The other members of the Department are 24 University Tenure Line, 57 Medical Center Line, 7 Non-tenure Line (Research), 2 Non-tenure Line (Teaching) and 20 Instructors.

Second, the faculty, overall, has 27% minority and 37% female members. However, the majority of Assistant Professors (60%) are female. The increase in the female:male gender ratio is beginning to be reflected in the leadership of the department: two of the

three recently appointed division chiefs and the majority of both the Pediatric Executive and Departmental Advisory Committees are women.

The CHI enabled the recruitment of a significant number of new faculty. This, in part, is responsible for the improvement in sponsored research projects, in which combined direct and indirect expenditures have risen from ~\$8 million in fiscal 1998 to \$27 million in fiscal 2008.

The department actively participates in undergraduate education; for example, 7 of our faculty members are directors/co-directors of scholarly concentration programs. The pediatric residency program has been recently expanded to 26 residents in each of the three years, and they carry out their training at the LPCH, Santa Clara Valley Medical Center, Kaiser and the community. Efforts are underway to expand the number of fellows from the current inadequate number (55) of fellows in the 14 pediatric subspecialties.

During the fall of 2007, prior to Dr. O'Brodovich's arrival, he completed a Strategic Planning process over 4 months in which the advice of department members was obtained through a consultative process carried out by department member teams assigned to each of the research, education, clinical care and administrative areas. The approach used a SWOT analysis and resulted in 6 Strategic Goals that the department is currently actively pursuing.

Stanford Students Promote Community and Public Service Initiatives

I was very pleased to participate, if only at the margin, in an undergraduate initiative entitled Vision Stanford 2020, which brought students, faculty and staff from across the university to share knowledge and experience about the community initiatives now taking place at Stanford and, more importantly, to probe the question of how to make community and public service a more seamless part of academic life. What was particularly gratifying, and even inspirational, was to witness the deep commitment of students from various disciplines and schools (including the medical school) to reaching out to serve our communities locally and globally in meaningful ways. This was not altruism *per se* (although some of that is not bad) but a serious effort to assure that public service is valued along with research and scholarship in the Stanford community. Given the inordinate focus in recent years on material gain and a mindset too often “me and not we” it was reassuring and impressive to witness the clear-minded and non-maudlin value placed on public service. Despite all the downturns we face today, this was a distinctly uplifting message, even with all of its challenges. Thankfully, it is notable how many community-based activities are already underway across campus. In addition to those at the Haas Center for Public Service, virtually every Stanford school sponsors student organizations and community offices and activities. Making these activities better known and more appropriately valued will be a big step forward – and one that the students and Vision Stanford 2020 are intent on doing. I certainly wish them every success in achieving their vision and goals.

Upcoming Events:

East-West Alliance Conference on Longevity

The East-West Alliance is a global network of ten institutions, including the Stanford University School of Medicine, that have been supported by the Li Ka Shing Foundation. The Alliance convenes annually at one of its member institutions to address significant scientific issues at a public conference. The School of Medicine is this year's host.

The focus for the 2009 conference is longevity across the life span. The Alliance, the Stanford Center on Longevity and the School of Medicine have brought together leading experts across a broad range of disciplines to address longevity-related topics in their fields. Session themes will include genetic considerations of longevity, stem cell connections to longevity, social correlates of longevity, longevity implications for the medical workforce, and economic correlates of longevity. Dr. Laura Carstensen, Professor of Psychology and Fairleigh S. Dickinson Jr. Professor in Public Policy, will give a plenary address on "Longevity in the 21st Century." Session moderators will include Stanford faculty members Dr. Stuart Kim, Professor of Developmental Biology and of Genetics and, by courtesy, of Chemical and Systems Biology; Dr. Tom Rando, Professor of Neurology and Neurological Sciences and Deputy Director, Stanford Center on Longevity; Dr. Paul Wise, Richard E. Behrman Professor in Child Health and Professor, by courtesy, of Health Research and Policy; Dr. Ralph Horwitz, The Arthur L. Bloomfield Professor of Medicine and Chair of the Department of Medicine; and Dr. John Shoven, The Wallace R. Hawley Director, SIEPR, Charles Schwab Professor of Economics and Senior Fellow, by courtesy, at the Hoover Institution

Date and Time:

Wednesday, April 15, 2009, 1:30 p.m. – 4:30 p.m.

Thursday, April 16, 2009, 8:30 a.m. – 12:00 p.m.; 1:15 p.m. – 5:00 p.m.

Location:

Clark Center Auditorium

Admission: Free. Open to the public

For more information: contact Mira Engel at mengel@stanford.edu

Medicine and the Muse

Dr. Audrey Shafer asked me to remind you about a terrific upcoming event, "Medicine and the Muse: An Arts, Humanities and Medicine Symposium," which will be held on Tuesday, April 28, 2009 at 5 pm in the Clark Center Auditorium. This year's event will feature Rob Kapilow (<http://www.robkapilow.com>) and the St. Lawrence String Quartet (<http://slsq.com/home/index.html>) – both of whom are truly wonderful. In addition, there will be music, presentations and art contributions by Stanford Medical Students. A reception and exhibit will follow in the Nexus Café in the Clark Center at 7 pm.

The Biomedical Ethics and Medical Humanities Scholarly Concentration; Arts, Humanities and Medicine Program; and the Stanford Center for Biomedical Ethics sponsor this terrific event. (<http://bioethics.stanford.edu/arts/>).

Medical Student Research Symposium

On Thursday, May 7th, the **26th Annual Medical Student Research Symposium** will be held in Hospital Atrium from 3:00-6:00pm. Close to 30 MD and MD/PhD students will present their original research presentations.

Students will be available at their posters for informal discussion from 3:00-5:30pm. At 5:45 pm following closing remarks the event will culminate with the announcement of student awards by the Stanford Medical Alumni Association.

Two student presentations from the Symposium on May 7th will be invited to give an oral presentation at Medicine Grand Rounds on Wednesday, June 3rd at 8:00am in Braun Auditorium in the Mudd Chemistry Building.

This promises to be a terrific event and we hope you will join our students for this year's Student Research and Population Health Symposium.

Awards and Honors

- **Dr. Paul Auerbach**, Professor of Surgery (Emergency Medicine) has been awarded the 2009 DAN/Rolex Diver of the Year Award. This award is given each year to an individual who has contributed significantly to dive safety or the DAN mission. Dr. Auerbach has written extensively on topics promoting dive safety, and has assisted with the development of the DN First Aid for Hazardous Marine Life training program. Congratulations, Dr. Auerbach!
- **Dr. Stanley Rockson**, the Allan and Tina Professor of Lymphatic Research, has been selected to be the inaugural recipient of the Pioneer Award from the Lymphatic Research Foundation (LRF). This award is presented to an individual who has been, and is, dedicated to the mission of the LRF. Congratulations, Dr. Rockson!
- **Dr. Irv Weissman**, Virginia & D.K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Developmental Biology &, by courtesy, of Biology, has been selected to receive the 2009 Passano Award. This award recognizes the originality and importance of Dr. Weissman's work, and his groundbreaking contributions in the field of modern stem cell biology. Congratulations, Dr. Weissman!

Appointments and Promotions

- **Todd Alamin** has been promoted to Associate Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 4/01/09.
- **Jaime Lopez** has been reappointed to Associate Professor of Neurology & Neurological Sciences and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 4/01/09.

- **Anna H. Messner** has been promoted to Professor of Otolaryngology – Head and Neck Surgery and of Pediatrics at the Stanford University Medical Center, effective 4/01/09.
- **Terry E. Robinson** has been promoted to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/01/09.
- **Theresa A. Tacy** has been appointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/01/09.

Dean's Newsletter

April 27, 2009

Swine Flu Alert

As you undoubtedly know by now, the White House issued a public health emergency notification on Saturday (April 25th) to activate federal resources to deal with the H1N1 flu outbreak that has arisen in Mexico and that has created significant concerns about the possibility of potential pandemic. The strain of the isolate from Mexico is H1N1 (which is the same as that which caused the 1918 pandemic), but it is not yet clear what level of similarity the new strain has to others in terms of virulence (although a number of deaths have been recorded in Mexico, albeit not elsewhere to date). The Centers for Disease Control and Prevention is posting the latest information on the outbreak, and it will be updated as new information becomes available. You can access that website at: <http://www.cdc.gov/h1n1flu/>.

The general guidelines for control of influenza include a number of simple steps. Here are the ones advised by the CDC:

I recognize that our physicians and students are well aware of these guidelines but I mention them for all readers of this communication.

CDC Influenza Precautions

Influenza is thought to spread mainly person-to-person through coughing or sneezing of infected people. There are many things you can do preventing getting and spreading influenza:

There are everyday actions people can take to stay healthy.

Cover your nose and mouth with a tissue when you cough or sneeze. Throw the tissue in the trash after you use it.

Wash your hands often with soap and water, especially after you cough or sneeze. Alcohol-based hands cleaners are also effective.

Avoid touching your eyes, nose or mouth. Germs spread that way.

Try to avoid close contact with sick people.

Influenza is thought to spread mainly person-to-person through coughing or sneezing of infected people.

If you get sick, CDC recommends that you stay home from work or school and limit contact with others to keep from infecting them.

I should also add that the Emergency Preparedness Operations from the Medical School, Stanford Hospital & Clinics and the Lucile Packard Children's Hospital are already in communication, along with the University, and further advice and guidance will be issued as new information becomes available.

Honoring Student Clinicians and Resident Educators

On Thursday, April 16th we hosted the third annual Student Clinician's Ceremony to celebrate the students who will be entering their clinical rotations this summer. This ceremony recognizes the important transition that takes place when medical students complete their preclinical years and prepare for the journey into clinical medicine. In the past this transition has been thought of as the second phase of medical school. I prefer to consider it as part of a continuum, since the goal is to continue to link and unite the insights from the basic sciences to clinical medicine. That said, for our students this transition constitutes a departure from the world of books, PowerPoint presentations, journal articles and discussion groups to the life and death struggles of individuals facing the challenges of acute and chronic diseases. They are moving from discourse and discussions that are often team based to the personal connections that ultimately constitute the doctor-patient relationship. They will also now experience a different form of learning – anchored in individual patients but expanded from the evidenced-based data they have been focused on to the “art of medicine” taught by residents and more senior physicians as well as nurses and other professionals.

Becoming a student clinician brings with it new responsibilities and accountabilities – and the need to acquire and perfect the knowledge of clinical medicine as well as the humanism and professionalism of the compassionate physician. This transition is a major inflection point in becoming a doctor, and I am very pleased that we are able to acknowledge and celebrate this with our students who begin their clinical rotations this summer. I want to commend them for the completion of their preclinical years, wish them well in the USMLE Part 1 and share in the moment of their personal development in clinical medicine.

I also recognize that as our students enter the clinical world they will have special contact with both the patients in whose care they participate and the residents and fellows who

also play an important role in shaping their knowledge and professional lives. I well recall the transition from medical student to resident even though (amazingly) it was some decades ago. I also recall the incredibly important role that residents play as teachers – to students, to each other, to their patients and to the faculty, nurses and broad medical care team – as shown in a longitudinal study I did during my own internship (*Pediatrics* 1975; 56:239-45). It was most appropriate, therefore, that an important feature of the Student Clinician's Ceremony was the presentation of this year's Arnold P Gold Foundation Humanism and Excellence in Teaching Awards to six outstanding Stanford Residents. This year's awardees include:

- ***Dr. Megan Daly***, Resident in Radiation Oncology
- ***Dr. Stephanie Fisher***, Resident in Obstetrics and Gynecology
- ***Dr. Amy Gallo***, Resident in General Surgery
- ***Dr. Zach Koontz***, Resident in Internal Medicine
- ***Dr. Eleni Unos***, Resident in Dermatology
- ***Dr. Amy McCammond***, Resident in Pediatrics

I add my enthusiastic congratulations to each of these outstanding residents and commend the students who selected them as this year's awardees. The important role of Residents as Teachers has been fostered by many professional societies and has had strong leadership at Stanford, thanks particularly to the pioneering efforts of Dr. Kelly Skeff, the George DeForest Barnett Professor in the Department of Medicine. Dr. Skeff is also the co-director of the Stanford Faculty Development Center for Medical Teachers.

Best wishes to our students who will begin their clinical education – and the residents and faculty who will participate in their training and development as they grow in knowledge acquisition, professionalism and humanism.

Evaluating Student Clinicians

Traditions, especially when long-standing, can be an integral part of an institution's culture and can strongly influence individual expectations. When traditions come to seem like permanent fixtures they can sometimes get out of alignment to changing life and world events. The form and substance of traditions include values, events and cultural norms that are both stated and unstated and that may be adhered to strongly and sometimes unquestioningly. A long-standing and deeply held institutional tradition at Stanford Medical School has been avoiding formal evaluations that might create unwanted competition or negatively impact on the value of shared support among Stanford medical students. I value those assumptions and continue to support the avoidance of formal grades for preclinical studies. However, I have long felt that a more formal evaluation process for clinical students is needed at Stanford, and I have expressed this view in numerous settings over the years I have been here.

There are obvious differences between preclinical and clinical studies and their immediate impact and outcome (also see above). The freedom to explore topics of interest, to study and learn at one's own pace and time line, to work in groups or alone in

structured or unstructured ways: these work well for preclinical studies. And our students have a long history of mastering the preclinical sciences well and of demonstrating their acquired knowledge by outstanding performance on the USMLE Part 1. While I do not wish to suggest that the USMLE is the best metric of knowledge, it does provide a means for our students to be assessed in comparison to others taking this exam. While I recognize that there is a range of views about this, I do not see a need to recommending a change in the way preclinical students are evaluated.

However, the evaluation of clinical performance is another matter and, in my opinion, is closely linked to becoming the best physician possible. This is true for those studying to become doctors as well as for those who continue to study to remain excellent physicians. Today physicians are being evaluated for their performance, the outcome of which impacts their compensation as well as their reputation among their peers and the public. An outstanding doctor possesses knowledge that is constantly deepening and becoming more refined and informed by clinical experience as well as by awareness of the changing evidence-based disease literature and its relationship to the scientific underpinnings that define it. It also changes over time as a function of new data, research and clinical experience.

Knowledge in clinical medicine commences at the start of medical school but takes a new form when clinical rotations begin. The teachers of that knowledge include the patients the student encounters and the trainees and established (attending) physicians who participate in the care of the patient. It is informed by the medical and scientific literature as well as informal and formal interactions with residents, fellows, attending physicians, nurses and other health professionals. Assessing that knowledge can be objective (such as performance on knowledge based examinations) or impressionistic (based on interactions with one or more of the teachers noted above). Of course these are not mutually exclusive, and the best assessment of clinical knowledge (just like its acquisition) comes from objective measures as well as assessments by peers and supervisors.

A serious problem today is that the contact of a student with a team of residents and senior physicians is increasingly limited to short intervals because of work hour limitations and the more rapidly changing rotation schedules of attending physicians. In years past it was common for a team of medical students, residents and senior doctors to spend several weeks together in the care of patients and shared educational interactions. Today, such contacts are often for less than a week and are sometimes even shorter – making observed learning more limited and subjective. Moreover, this type of evaluation is potentially biased by favoring students whose personalities can lead to a style of presentation or interaction that implies more knowledge than might be actually be the case. Conversely, such interactions can undervalue students who are more reserved, but whose actual knowledge is in fact quite deep. I do not want to suggest that the interactions and assessments by residents and attending physicians are not valuable – they are – but that they need to be part of a composite and coordinated evaluation.

Accordingly, it is important to define more clearly the expectations of knowledge-based performance and how it is evaluated by each clinical rotation and to make certain that

students are informed of how they will be evaluated at the outset of each clinical experience. When this is not done, “shadow” evaluation systems emerge (as they have in fact done) that lack transparency and comparability

A part of the evaluation process includes defining the objective metrics of knowledge in specific clinical areas (e.g., the “shelf exam” prepared by the National Board of Medical Examiners – or other defined objective knowledge-based tools). I know there is some debate about the shelf exam and its merits. While no exam is perfect, the shelf exam is broadly used, and it is a tool our clerkship directors should evaluate further. If there is a more valid assessment of clinical knowledge it can be substituted for the shelf exam. But there should be an objective measure of clinical knowledge that is taken seriously by all. At the same time, it is important to couple this objective measure of knowledge with the interactive assessment of clinical knowledge and performance that is gleaned from observations by residents and attending physicians as noted above. However, those assessments need to be better defined and understood by the students and the evaluators.

Excellent knowledge in a clinical subject matter should be an expectation for all of our students, but it is not the complete portrait of what constitutes an exceptional physician. Skills in communication, assessment of physical findings and diagnostic tests, the ability to formulate a diagnostic and treatment plan, and interactions with members of the care team, including evidence of compassion and humanism, are all features of being an excellent physician. These skills can also be learned and should also be evaluated. Excellent knowledge without professionalism and compassion is not sufficient to be an outstanding clinician. Similarly, compassion without excellent clinical knowledge is also insufficient.

Assessments of physicians’ skills are increasingly becoming part of the fabric of medicine. As noted above, these include assessments of quality of care metrics and outcomes that are being increasingly linked to payment and that are becoming more publicly available and accessible. So too are objective measures of knowledge and, increasingly, service to patients. I recognize that physicians and medical institutions are paying attention to such metrics for a variety of reasons; in my view, one of the most important should be the desire to be the best possible doctor in every domain of medicine.

At Stanford, the evaluation of students doing clinical rotations has been loosely constructed. In some clinical rotations, faculty and students have taken assessments of clinical performance seriously and have sought ways to define excellence. Indeed, in some rotations a shadow evaluation system has emerged, although in a not very transparent way. However, in most rotations the process is more informal. There is an assumption by some that every student performs in an outstanding manner and thus no formal assessment is necessary. There is also a concern that a more formal assessment would create competition among students doing a clinical rotation, and thus negatively affect their collegiality or community or even change the culture at Stanford. There is a view that a lack of formal assessments is not a problem for students graduating from Stanford since they do well in the Residency Match. In this view, coming from Stanford

is a sufficient indicator of excellence and is one that is widely appreciated by residency training programs around the country. After all, Stanford is unique among its peers.

While I agree that Stanford is unique, I do not agree with the view that clinical performance is always excellent or that the way we have been evaluating our students is widely respected and valued by our community – either within Stanford or around the country. Nor do I believe that our current system of “pass”, “marginal pass” (and/or the so called “N” grade) or “fail” is appropriate, sufficient, transparent or meaningful. Further I do not believe that this system fosters the best education and training for students doing their clinical rotations at Stanford – or in communicating performance to those who will be entrusted with continuing their future education.

Based on these observations and conclusions, I have had a series of recent meetings and discussions that confirm the changes in the assessment of clinical performance by Stanford students during their clinical rotations that I will highlight below. This includes concurrence by the clinical clerkship directors, the deans for medical education, the faculty advisors and the chairs of our clinical departments. In defining the changes that will occur I want to add that this will be a work in progress. I shared these policy changes at a Town Hall Meeting of medical students on April 20th and received many thoughtful and important questions. As I indicated to the students who were able to attend that Town Hall Meeting, we are receptive to their thoughts, recommendations and suggestions about how to make our evaluation system better but with one important caveat. The evaluation system for clinical performance is going to be changed. With that, here are some of the outlines of that change:

- The clinical clerkship directors have been instructed to develop a new system of evaluating clinical performance to be implemented in the summer of 2010. This new evaluation system will apply to all students entering clinical rotations at that time --thus, it applies to our current first year students as well as to students who will be emerging from their research experiences to begin clinical rotations in the summer of 2010. I fully recognize that first year students and those in multi-year programs entered Stanford with a different expectation, but I view the changes as something that will help them become better physicians and that will enable them to receive feedback that is more meaningful to their career development.
- Because we want to take the next year to refine the new evaluation system, it will not apply to students who will be entering clinical rotations in the summer of 2009, with some important caveats that I will comment on below.
- The new evaluation system should assess knowledge and clinical performance based on objective measures (e.g., the shelf exam or its alternative) as well as evaluations by residents and attending physicians. Such assessments must include all domains of clinical performance -- from knowledge to professionalism and humanism. Further, those criteria need to be defined and shared with those doing the evaluations and ratings as well as with the students.
- The new evaluation system will apply to required rotations in 2010. In future years they will be extended to elective rotations (including sub-internships), although I would hope that the criteria would be applied to electives, etc by 2011.

- While the exact terms are yet to be defined, I instructed the clerkship directors to develop specific criteria for the following categories. I should quickly add that the actual terms can be changed -- these names are placeholders that are meant to capture the intent.
 - Exceptional performance
 - Satisfactory performance
 - Marginal performance
 - Unsatisfactory performance
- As noted, initially these criteria will apply to only the required courses. The factors and metrics that define each category should have both common features across all clinical disciplines and also specific ones that are relevant to individual clinical rotations. The criteria for evaluating students will be made explicit to all students and faculty and should be readily accessible. They should also be made available at the beginning of each clinical rotation so that students understand the expectations and criteria by which they will be assessed.
- There will be no preset curve or limit on the number or percentage of students who can receive an Exceptional Performance during a rotation or during a specific year. For example, if all the students on a specific rotation fulfill the criteria for Exceptional Performance, they will all receive that rating. If none fulfill the requirements then none will receive it. We will not predetermine how many students during any given year will receive an Exceptional Performance rating in any rotation. And we will work with faculty to guard against any tendency or bias to limit or "curve" student performance. In the end, the evaluations should follow the criteria that have been established.
- Exceptional Performance should reflect accomplishments in all domains -- knowledge, professionalism, quality and service. Excelling in knowledge alone or in professionalism alone will not merit an Exceptional Performance -- it must reflect achievements in all areas.
- As part of the new evaluation system, faculty and students will be counseled on expectations. This includes not only the criteria for performance but also the need for an evaluation discussion and feedback at the beginning, at mid-rotation and at the conclusion of each rotation. We will certainly pay attention to inter-rater reliability issues that apply to all evaluation systems. This is one of the reasons for using objective and defined criteria as well as knowledge metrics as part of the evaluation process
- The clinical performance will be a part of the overall student assessment. Other components include the preclinical experiences (including the USMLE Part 1), research and scholarship, participation in joint degree programs (where appropriate), assessment by faculty advisors and mentors, and narrative summaries of performance. All of this information will be shared with residency directors as part of the student performance evaluation (including in the "dean's letter"). In doing so, we will also make residency directors aware of the changes we are making in the evaluation system at Stanford, to whom those changes apply and the time lines that are being employed. More specifically, we will share the specific criteria used to determine exceptional and satisfactory performance. Once

we have this information, not sharing it would be dishonest and, in my opinion, inappropriate.

- As noted above, the new evaluation system will commence in the summer of 2010 for required clinical rotations and over the next year(s) will be rolled out to include electives and sub-internships. Students who are mid-way in their clinical rotations (that is, they began in 2009 or are returning to clinical rotations after an out-year) will have the same evaluation system in required rotations taken after summer 2010 as students beginning rotations for the first time in 2010. However, we will not share the rating of Exceptional Performance to residency programs for students who have already completed a year of clinical rotations. That information will be for internal use but could help shape the comments used in the students "dean's letter".

As I noted above, the clinical clerkship directors, led by Dr. Elizabeth Stuart, will be responsible for developing and recommending the criteria by which to assess each of the aforementioned performance domains over the next year. My plan is to make the criteria transparent and broadly shared by the early spring of 2010. That will also enable us to inform faculty and others who participate in the evaluation system about the expectations and criteria that will become effective in the summer of 2010. During that time there will be many opportunities for students to offer comments and suggestions for improving the system. What is clearly decided at this point is that we will be moving forward with these changes and with the time lines for implementation delineated above. That said, there are many details to be worked out, and we will be receptive to all constructive comments and suggestions. In closing, I want end where I began. My goal is to have systems in place that will help all of our students achieve their potential of becoming exceptional physicians.

The Stimulus Stimulates NIH Applications

No one in academic medicine is unaware of the looming impact of the ARRA (American Recovery and Reinvestment Act) on science and technology – and the NIH specifically. After six years of funding levels below inflation, ARRA has added \$10.4 billion to the NIH for research, equipment and construction (<http://deansnewsletter.stanford.edu/>), with the important caveat that it be spent before September 2010. Information about funding opportunities has been flowing fast and furious, and there is a lot of helpful information and updates about ARRA opportunities on the Research Management Group (RMG) website (see:

http://med.stanford.edu/rmg/funding/nih_recovery%20act_funding_opps.html). These are complemented by Jeanne Heschele's frequent updates about ARRA and other funding opportunities. Indeed, over the past weeks faculty have been busily writing grants and proposals for the first wave of submissions; these include Challenge Grants and Administrative Supplements, which are due Monday, April 27th. This is the first wave of submissions, with more to come in the months ahead. To prepare for the April 27th submission deadline RMG staff have been working late into the night during the past two weeks processing grants for submission. We are extremely appreciative of their

efforts and those of the other support teams who are working hard to help faculty compete for ARRA funding.

The actual number of grants that will be submitted continues to change day by day. As of Saturday, April 25th there were 207 Challenge Grants moving to the final process for submission – with more expected in the next days. In addition, RMG has already submitted 89 Administrative Supplements and 28 Shared Instrument Grants. And there will be more supplements, GO (grand opportunity) grants, major facility, faculty search and other grants forthcoming – in addition to the regular run of RO1 and related grants. This is truly an unprecedented time in every way – and certainly one that will achieve one of the major ARRA goals of preserving and creating jobs, as well as supporting science and technology – and hopefully ultimately advancing medical care and treatment.

I want to begin by thanking **Kathleen Thompson**, Director of RMG, and **Sonia Barragan**, Associate Director, for leading this effort and for helping to assemble and train a great group. **Jeanne Heshel** has done a great job in communicating all of the announcements from NIH and in helping to set up a very helpful website. I also want to thank all the RMG Staff and support staff who have been working so tirelessly to get grants ready for submission to NIH:

- **RMG Team Managers** - Amy Barelli, Luke Delong and Gabriela Valencia
- **Research Process Managers (RPM)** - Nadia Burke, Gayle Campbell, Josephine Dao, Linh Dinh, Karen Fisher, Candy Housholder, Javier Illueca, Gladys Morales, Karen Mulkey, Linda Murtagh, Natalie Muzzio, Dymphna Nagar, Elaine Nguyen, Mary Palmer, Tracy Reynolds, Randy Rodriguez, Andy Roybal, Bach-Hong Tran, and Anna Eredia (Temp).
- **RPM Associates**- Michael Canizares, Cecilia Fajardo, Martha Galvez, Teresa Hinkle, Valentin Salazar, Rolanda Smith.
- **CT Group** - Debbie Leong-Childs, Ruth Bondy, Diana Cook, Amanda Graves, Marta Krupa-Pionowska, Julie O'Neill, Elizabeth Sotelo, Karen Wong, Anne Anastasi.
- **Administrative Staff** - Laura Butler, Mila Dacorro, Mario Garcia, Colleen James, Karen Kellner, Tiffany Binderup

Staff in academic departments have also worked diligently to meet the NIH deadlines. These include Ophelia Zalamea, Susan Kopiwoda, Sue Elliott, Kathy Fisher, Tara Trim, Diane Bush, Hoa Nguyen and Manolia Margolis.

We also want to thank the many people who have worked hard and whose names we haven't mentioned. Again, special thanks to all – and best wishes to our faculty in winning new NIH awards.

Stanford Graduate Students Featured in Open Lab Visits

On Saturday, April 18th the Bioscience Programs held an “open lab event” showcasing the work done by Stanford graduate students. This event was originally championed by Dr. Andy Fire, Professor of Pathology and of Genetics, as a way of better educating the community about basic science research and the excellence of Stanford’s graduate student programs. With the assistance of Denise Ellestad, Senior Director of Development Programs, and members of the Office of Medical Development, an excellent program was configured that proved highly successful.

Approximately 35 guests from the community first heard a broad introduction to the Stanford Bioscience Program from Drs. Andy Fire, Ron Kopito (from the school of Humanities & Sciences), Steve Quake (Bioengineering) and Carla Shatz (BioX) and were then divided into nine groups. Each group toured a specific lab with a faculty guide, met with graduate students and postdocs in that lab and observed demonstrations of their work. These were hands-on visits, and from the reports I have already heard from some of our visitors, they were exciting and very well received. The lab visits were followed by an interactive lunch with the students and visitors – again very well received.

In addition to thanking our faculty and the Office of Medical Development, I want to particularly thank our graduate students for their spirited and inspirational presentations and discussions. They included the following:

- | | |
|----------------------------------|--|
| • Sherlock Lab (Genetics): | Dan Kvitek, Jared Wenger, Yuba Kobayashi |
| • Kay Lab (Pediatrics): | Neil Phillips |
| • Herschlag Lab (Biochemistry): | Sergey Solomatin, Max Greenfeld |
| • Straight Lab (Biochemistry): | Kirstin Milks, Ben Moree |
| • Kornberg Lab (Structural Bio): | Dave Bushnell, Dong Wang, Brian Gibbons |
| • Boothroyd Lab (Micro/Immuno): | Matt Anderson, Yi-Ching Ong |
| • Kopito Lab (Biology): | E Greenblatt, S Trevino, R Tyler, J Olzmann |
| • Utz Lab (Medicine): | Alvina Chu, Jordan Prize |
| • Spudich Lab (Biochemistry): | J Min Sung, P Chuan, S Sivaramakrishnan |
| • Steinman Lab (Neurology): | S. Bronwell, B deJong, M Han, B Axtell, P Ho |
| • Frydman Lab (Biology): | Steffanie Duttler, Bryan Chen |
| • Quake Lab (Bioengineering): | Aaron Streets, Paul Blainey, Angela Wu |
| • Luo Lab (Biology): | M Spletter, L Sweeney, J Wu, L Liang |
| • Nusse Lab (Developmental Bio): | Xinhong Lim |
| • Fire Lab (Pathology): | Eleanor Marshall, Poornima Parameswaran |

Thanks to all for a great event. The next similar event will be held on June 3rd.

Dr. Michele Barry Joins Stanford as Senior Associate Dean for Global Health

I am very pleased to announce that on May 1st Dr. Michele Barry will join Stanford as the Senior Associate Dean for Global Health and also the Director of Global Health Programs in the Department of Medicine. The Senior Associate Dean position is a newly

created post that reflects the School and Medical Center's commitment to the importance of education, research and patient care issues related to global health. While a number of our faculty are involved in research in global health and others conduct education and patient care activities in a wide variety of international settings, we have lacked a central or coordinating office or an individual identified to lead the School's efforts in this increasingly important area. Dr. Barry is an ideal choice for this role and we are fortunate and thrilled to have her joining Stanford.

Dr. Barry joins Stanford from Yale where she has been a Professor of Medicine and Global Health and Director of Yale's Office of International Health. At Yale she has also directed the Yale/Johnson and Johnson Physician Scholar Award program that has sent over a thousand physicians to work overseas to strengthen health infrastructure. Dr. Barry has enormous personal experience working, conducting research and teaching in international areas. In addition, she is an expert in tropical medicine and emerging infections as well as in the health problems of developing nations consequent to globalization. Importantly, she is highly regarded for her scholarship, research and leadership. She is a member of the Institute of Medicine of the National Academy of Sciences, where she has been chair of the IOM's Interest Group on Global Health, Infectious Diseases and Microbiology. She has served as the President of the American Society of Tropical Medicine and as the Executive Board Chairperson of the Professional Education and Training Committee at the International Society of Travel Medicine.

As she gets ready to begin her new role at Stanford, Dr. Barry has laid out some short and longer term objectives based on the many meetings and discussions she has had with faculty, students and staff throughout the Stanford community. A primary goal is to create the Office of Global Health, which will anchor the school's efforts and create synergies with the greater university and especially the Freeman-Spogli Institute for International Studies at Stanford. Part of this effort will be developing a global health web portal codifying faculty activities to make them accessible and engender collaborations and interactions. Dr. Barry also hopes to bring scholar award programs to Stanford that will permit resident trainees as well as faculty members to work in a number of international sites. She is also anticipating programs for medical students and this summer will be helping to facilitate the "Global Health Services Corps" at Stanford, which helps place college students in various sites around the world. Applications for this summer's program are now closed, but Dr. Barry will outline opportunities for future programs after she arrives.

Dr. Barry has informed me that she plans to initiate a seminar series in September that will focus on the broad aspects of global health – from medicine to engineering and environmental sciences as well as ethics, economics, policy and other important topics. This will be open to students, residents and faculty. Details will follow.

In addition to these immediate goals, Dr. Barry has begun to layout her longer-term objectives, which I know she will be eager to share in the months ahead. In the meantime I hope you will join me in welcoming Dr. Michele Barry to Stanford.

Rising in the Ranks in US News & World Reports

I admit to having a challenging relationship with the USNWR annual ranking of medical and graduate schools over the years. As I have discussed in prior Dean's Newsletters, a major concern has been the weight given to total NIH funding, which favors schools with large faculty numbers. Obviously this has a negative impact on smaller research-intensive medical schools like Stanford, whose faculty numbers are half to 10% of those at peer institutions. I was relieved a couple of years ago when the editors of USNWR changed the methodology to include NIH research grants per faculty member, where Stanford does extremely well. However, the relative blending of total NIH funding and funding per faculty member still favors size as a surrogate for quality.

Despite my concerns, it is (at least on a relative scale) good news that the Stanford School of Medicine rank rose to #6 in the 2009 USNWR listing that was published on April 23rd (in truth, we are "tied" for sixth with Duke, U. Washington and Yale). The major methodological factors used in the ranking include quality assessment (which is really a reputational score), research activity (which is really a 2:1 blending of total funding and funding per faculty member), student selectivity (which includes admitted students GPA, MCAT scores and acceptance rate) and faculty resources. Clearly some of the important measures are missing – like what happens to students who graduate and the degree of indebtedness incurred by students, among others.

Regardless of whether one likes the methodology used in these rankings, it is clear that the core factors reflect the success and accomplishments of our students and faculty and that is something very much worth valuing – above and beyond any score. I do very strongly believe that we have the best students and faculty and, in my opinion, on that score we are #1!

While the MD part of medical schools are ranked annually by USNWR, the PhD graduate programs are ranked less frequently. These rankings, when they are done, are based mostly on a reputational score. The last time the biosciences were ranked was in 2007. At that time Stanford was #1 overall with specialty rankings of #1 in biochemistry/biophysics/structural biology, genetics/genomics/bioinformatics; #2 in immunology/infectious disease and microbiology and in neuroscience/neurobiology; and #3 in cell biology and molecular biology.

So, despite all my misgivings, Stanford is doing quite well – thanks to our faculty and students.

Some Notable Events

- ***The 2009 Beckman Symposium*** led by Dr. Lucy Shapiro, Ludwig Professor of Developmental Biology and Director of the Beckman Center, was held on April 13th and addressed Global Health and Emerging Infectious Diseases. The symposium featured experts from academia, foundations and industry and addressed a wide range of topics, from the use of genomic approaches to

emerging infectious disease surveillance and discovery to major themes in global health challenges including tuberculosis, HIV, cholera, salmonella and vaccines. It was an outstanding symposium thanks to the leadership of Dr. Shapiro and the co-sponsorship of the Stanford Institute for Immunity, Transplantation and Infection.

- ***The East-West Alliance*** held its third annual meeting at Stanford from April 15-16 and focused on longevity and aging from the molecular and cellular determinants of aging to the social issues and disparities that impact longevity, the workforce challenges in addressing an aging population and the economic and societal factors the result from increasing longevity. This two day symposium was coordinated by the East West Alliance, a federation of institutions around the world that have received gifts or support from the Li Ka Shing Foundation – which, for Stanford, includes gifts for the Learning and Knowledge Center and a professorship currently held by Dr. Alan Yeung and past support for hepatitis research.
- ***Stanford Alumni Experience The Cutting Edge***. On Saturday, April 25th, nearly 200 alumni and family members participated in a unique hands-on experience hosted by the Alumni Association. Called The Cutting Edge, it enabled small groups of visiting alumni to participate in up to three interactive sessions that ran that gamut of Stanford Medicine. Sessions were led by Stanford faculty and included such wide ranging topics as “Biotechnology: Filling the Education Gap” to the use of a “Simulation-based Endovascular Curriculum on Trainee Performance and Clinical Outcomes in Vascular Surgery” to the use of “Small Interfering RNA as a Therapeutic Modality” or “Imaging Using Molecular Spies”, “The Biomechanics of Human Motion”, “Visual Anatomy: Past, Present and Future” or “Personalized Medicine”. It was a great program and I want to thank Dr. Ross Bright, the Alumni Association and the Office of Medical Development – which did an incredible job with all the complicated logistics. This was a great way to reacquaint alumni with each other and with the present and future of Stanford Medicine.

Honoring Stanford Alumni: The Sterling Awardees

The Stanford University Medical Center Alumni Association honored two prominent graduates of the School of Medicine with the JE Wallace Sterling “Muleshoe” Lifetime Alumni Achievement Award. This year’s awardees are:

- ***Paul M Ellwood, Jr, MD’53***, advisor to seven presidential administrations on health care, planner for the National Center for Health Services Research and Development (now known as AHRQ), founder of the Jackson Hole Group on health policy research, founding member of the National Association of Rehabilitation Centers and Clinical Professor of Pediatrics, Neurology and Physician Medicine and Rehabilitation at the University of Minnesota. Dr. Ellwood currently lives in Wyoming and is still actively engaged in health care

policy through his Health Leaders InterStudy (<http://home.healthleaders-interstudy.com/index.php>).

- **Robert Schimke, MD '58**, renowned scientist and Stanford faculty member who served as Chair of the Department of Pharmacology and, subsequently, of the Department of Biological Sciences. His research contributions have been recognized by numerous awards and honors, including the Sloan Prize, election to the Institute of Medicine and the National Academy of Sciences, and presidency of the American Society of Biochemistry and Molecular Biology.

Awards and Honors

Dr. Shreyas Vasanawala, Assistant Professor of Pediatric Radiology at the Stanford University School of Medicine and Co-Director of Pediatric MRI at Lucile Packard Children's Hospital, was awarded the Lauterbur Award by the Society of Computed Body Tomography & Magnetic Resonance for his scientific paper "Faster Pediatric MRI with Compressed Sensing". His collaborators included Marcus Alley, PhD; Gary E. Gold, MD; Robert J. Herfkens, MD; John Pauly, PhD; and Michael Lustig, PhD. The Lauterbur award is presented annually for the best original research in MRI, and this is the first time the Lauterbur award has recognized fundamental research performed by a faculty member at a children's hospital. Congratulations, Dr. Vasanawala.

2009 Paul & Daisy Soros Fellows

We have just learned that Stanford is again the recipient of four new Soros Fellowship "awards "designed to assist immigrants and their children prepare for opportunities for leadership in their various fields in the United States." This year's recipients include:

- **Ronald Wakim Alfa** - born in Santa Ana, CA (his parents from to the US from Lebanon), is currently an MD/PhD student at Stanford
- **Michael Chiu** - born in La Jolla, CA, (his parents came to the USA from Taiwan and Hong Kong) is studying medicine at Stanford
- **Edward Pham** - born in Ho Chi Minh City, Vietnam, is currently studying medicine at Stanford
- **Roberto Valladares** - born in Santa Monica, CA (his parents came from Guatamala) is currently studying medicine at Stanford

Please join me in congratulating these 2009 Soros Fellows. This year's Fellows were selected from 750 applicants. Of all the Soros Fellows from 1998 to the present who have studied medicine, 24% had or are attending Stanford Medical School.

Appointments and Promotions

- **Ravindra Majeti** has been appointed to Assistant Professor of Medicine, effective 5/01/09.

- **Rajat Rohatgi** has been appointed to Assistant Professor of Medicine, effective 5/01/09.
- **Anne M. Villeneuve** has been promoted to Professor of Developmental Biology and of Genetics, effective 5/01/09.

Dean's Newsletter

May 11, 2009

Twenty Days Following the First Report by the CDC of H1N1

On April 21st the Centers for Disease Control and Prevention (CDC), in a Morbidity and Mortality Weekly Report (MMWR) dispatch, reported two cases of swine flu infection in southern California, thus calling attention to a new influenza virus that was quickly linked to a large outbreak taking place in Mexico. Within days, public health systems in the USA and around the world became increasingly focused on the possibility of a pandemic influenza outbreak. Although many important questions remain to be resolved, an incredible amount of information and policy implementation occurred globally to contain the potential for a very serious global infection. Thankfully, the infection seems to be reasonably contained at this point – due in large part to the local, community, state, national and global responses that took place and that were generally well coordinated. The fact that the infection proved less virulent outside of Mexico also played a role in containing panic and spread of infection and its consequences.

As of Saturday, May 9th, the CDC reports 2254 laboratory-confirmed H1N1 (swine flu) cases in 44 states (see: <http://www.cdc.gov/h1n1flu/>). To date, two of these infections have led to death – both in Texas, one a child from Mexico and the second in a young woman reported to have other co-morbidities. The World Health Organization reports 2330 laboratory confirmed cases of H1N1 infection in 29 countries around the world (<http://www.who.int/en/>). While the pandemic is not over, the pace of new infections is ebbing, and some of the local and community isolation and control mechanisms and policies are being curtailed. But nearly every health department and center is analyzing what went well during the past 20 days – and what did not - for good reason. Even if the current infection declines (especially as we move out of the traditional flu season) there is every reason to be concerned that this H1N1 virus will re-emerge in the fall during the traditional flu season. After all, that is what happened in 1918 when an H1N1 infection emerged in the spring and caused relatively mild flu symptoms, only to return in the fall and winter with the devastating global infection that caused over 50 million deaths around the world. Needless to say, every effort must and will be made to prevent a similar occurrence this next fall or in the years ahead.

While the ultimate control of a pandemic depends on a united and coordinated global response, these efforts begin and are most critically affected by local events. In the last several days, leaders from throughout the Stanford Medical Center (including Stanford

Hospital and Clinics, the Lucile Packard Children's Hospital and the School of Medicine) have already begun serious "post-mortem" analyses that are being further coordinated with the University, the County and ultimately with broader constituencies. Thanks to the extensive planning that had been put in place in recent years to prepare for emergencies like pandemics, natural disasters and man-made events, the systems to respond to the H1N1 infection were well defined and were activated very early in the process at Stanford— by April 24th, well ahead of most other agencies. Importantly, the coordination within the medical center was excellent, especially by medical, nursing and administrative leaders, who met multiple times each day, coordinated policies and messages, created novel approaches (including a new geographically defined isolation/screening site to remove patient pressure from the Emergency Department and, importantly, to better contain potential infection).

Challenges about available personnel and other resources were delineated and are now being compiled into reviews that will become the action plans for next fall. At this point it is impossible to make any assumptions about whether the current H1N1 virus will re-emerge in its current form (which has been proven to be mild and sensitive to two antiviral agents) or whether it will more or less virulent. Thus plans for all contingencies will be needed.

Of course in addition to public health planning, considerations about preparing a vaccine that includes the current H1N1 virus are also underway. The observation that fewer individuals above 35 encountered infection suggests that prior immunity to other strains that bear some antigenic similarity to H1N1 afforded protection to older adults. This is an encouraging sign that a vaccine might prove helpful. Efforts are already commencing to prepare a vaccine that could be available in 4-5 months – hopefully in time for the traditional time frame for the 2009 flu season.

There are many resources that can be consulted as guides for the months and years ahead. The Institutes of Medicine of the National Academy of Sciences has released a number of policy recommendations that address:

- Communicating with and engaging the public
- Use of masks and personal protective equipment
- Use of antiviral drugs and vaccines
- Outbreak mitigation (e.g., social distancing, school closures)
- Surveillance, research, and evaluation during a pandemic

These and related reports can be accessed at <http://www.iom.edu/CMS/66154.aspx> - the IOM "Guide to Recent Institute of Medicine Studies and Workshops regarding Pandemic Influenza." For those interested in some of the historical connections regarding swine flu, Dr. Harvey Fineberg, President of the IOM, has made his book on the 1976 swine flu outbreak available on-line as a free PDF (see: <http://www.iom.edu/CMS/65954.aspx>). Entitled "*The Swine Flu Affair: Decision-Making on a Slippery Disease*," this book reviews the numerous controversies, administrative challenges, legal complications,

unforeseen side effects and more regarding the 1976 swine flu epidemic. It makes for interesting reading.

Knowing the past can help us forecast the future. I hope that we will learn from prior pandemics and events, including those of the past 20 days, so that we can be more prepared for the inevitable infections that will occur later this year.

The Institute of Medicine and Conflict of Interest: Catching Up to Stanford University

On April 28th the Institute of Medicine of the National Academy of Sciences released its report entitled “Conflict of Interest in Medical Research, Education and Practice” (see <http://www.iom.edu/CMS/3740/47464/65721.aspx>). As noted in the précis:

The committee’s report stresses the importance of preventing bias and mistrust rather than trying to remedy damage after it is discovered. It focuses specifically on financial conflicts of interest involving pharmaceutical, medical device, and biotechnology companies.

The committee recommends the implementation of policies and procedures that will reduce the risk of conflicts that can jeopardize the integrity of scientific investigations, the objectivity of medical education, the quality of patient care, and the public’s trust in medicine.

I had the opportunity to provide testimony to the IOM Committee preparing this report, and I also served as a reviewer prior to its publication. It codifies well the guidelines and recommendations that should be embraced by academic institutions in the broad continuum of industry- academic relationships.

While the IOM report establishes a national context, Stanford Medical School and Medical Center has been at the forefront of COI issues and reforms. As many of you know, we implemented the Stanford Industry Interactions Policy (SIIP) in October 2006. This policy governs interactions, largely in the clinical and educational arenas, with the pharmaceutical, biotech, medical device, and hospital and research equipment and supplies industries. It includes provisions regarding, among other issues, gifts from industry, access of sales and marketing representatives to our campus, and industry support of education.

In recent months the policy has been updated to include, among other changes, our CME Commercial Support Policy (http://cme.stanford.edu/commercial_support.html), which was introduced in 2008. Greater clarity concerning participation in meetings or conferences supported by industry has also been provided, including an explicit provision that participation by Stanford faculty in so-called speakers bureaus is contrary to the policy. The updated policy can be found at <http://med.stanford.edu/coi/siip/>.

SIIP continues to be the defining document for our interactions with industry in the clinical care and educational areas. Given the prominence of these issues in the

public domain and the changing landscape of conflict of interest, it is important that we maintain the currency of the policy and that all of us assure that our own interactions with industry comply with its provisions.

NIH Guidelines on Stem Cell Research

Following President Obama's March 9, 2009 Executive Order (#13505) on stem cell research, the National Institutes of Health has released guidelines on "Human Stem Cell Research" that are available for public comment (see:

<http://stemcells.nih.gov/policy/2009draft>). To date about 7000 responses have been submitted to the NIH – most from individuals and organizations opposed to stem cell research. While there are some limitations regarding the proposed NIH policy, especially around the unfortunate limitations regarding somatic cell nuclear transfer, the overall policy is a major step in the right direction. I would encourage you to review the policy and, if you agree, offer your support for what the NIH is proposing (with any caveats or recommendations you deem appropriate). It is important that the scientific community unite to support the important changes in the direction of science and research that the Obama Administration is bringing forth. In the case of the NIH stem cell guidelines, individual comments of support will be important – and can provide a counter to the voices of those who would prefer to once again bring down the curtain on this important area of research. So please add your voice before May 26th. Comments can be entered at: http://nihoerextra.nih.gov/stem_cells/add.htm.

Medical Student Admit Weekend

By May 15th students admitted to medical schools across the USA will need to finalize their selection. To help with that process, the Stanford School of Medicine hosted its Admit Weekend 2009 on May 8-9th. Each year 86 students form the medical school's incoming class. They are selected from an applicant pool of over 6000. The students who have received formal acceptances to Stanford were invited to campus for a weekend of information exchange, meetings and social interactions. Over 55 students elected to participate in this year's Admit Weekend (this is similar to past years). I had the privilege of meeting most of the students at different events, and I continue to be in awe of the talent that each individual brings. We are so fortunate to have such outstanding students at Stanford – and the class arriving in August will surely continue that great tradition.

The 26th Annual Medical Student Research Symposium

On Thursday, May 7th, thanks to support from the Stanford University Medical Center Alumni Association, the 26th Annual Medical Student Research Symposium was held. Students presented poster sessions of the work they have carried out through the Medical Scholars or the Scholarly Concentrations Programs in an amazingly wide variety of areas and topics. Just over 60 posters were presented, the abstracts for which can be viewed at http://med.stanford.edu/student_research/events.html#symposium. Special thanks go to the Symposium Committee, including Dr. Loren Baker, Director of the Scholarly Concentration Program, along with Dr. Patricia C. Cross, Associate Dean for Medical

Student Research & Scholarship Advising; Mara Violanti, Scholarly Concentrations Program Administrator; Chris Cueva, Medical Scholars Program Coordinator; and medical students Alana Frost, Matthew Goldstein, Gene Ma, Sarah Nelson, Wendy Pang, Sarah Pickard, and Judy Yeh.

One of the most important features of Stanford Medical School is the opportunity our students have to participate in research and scholarship. While it is always a challenge to reduce months to years of work to a single poster or publication, for each student this tangible outcome represents the results of the opportunity he or she took to create knowledge and contribute directly to improving our understanding of science, medicine, policy and the world we live in. While we all benefit from new insights, the student who has done the research – formulated the hypothesis or goals, done the experiments or gathered the data, analyzed the results and prepared them for presentation – benefits uniquely from the experience. In that vein, everyone also has the opportunity to benefit, through sharing and discussing the work. An additional tradition of the Research Symposium is to select the five most outstanding poster/abstracts – which can of course be a daunting task in and of itself. This year the faculty and student judges included: Marissa Aillaud, James Berbee, Tiffany Castillo, Patricia Foo, Dr. Neil Gesundheit, Joshua Goldner, Mariko Howe, Dr. Susan Knox, Andrew Lee, Aabed Meer, Laura Prolo, Jeremiah Ray, Dr. Oscar Salvatierra, Jessica Tsai, Anelea Venegas, and Jane Whitney. Additional thanks to each of this year's judges, who selected the following poster presentations as this year's top five (not listed in any priority order):

Student	Poster Title	Faculty Mentor
Steven Lin <i>SMS 3</i>	Stopping a Silent Killer in the Underserved Asian Community: A Novel Liver Cancer Prevention Clinic	Frank Trihn
Geoff Krampitz <i>SMS 5</i>	Adventitial VEGF Signaling is Critical for Restenosis After Vascular Injury	Ching-Pin Chang
Gavitt Woodward <i>SMS 3</i>	Altered Alcohol Metabolism Following Roux-En-Y Gastric Bypass	John Morton
Joshua Troke <i>SMS 2</i>	The Use of Metformin as a Cardioprotective Agent in Heart Transplantation Decreases Ischemia –Reperfusion Injury and Increases Graft Function and Survival	Michael Fischbein
Carlene Chun <i>SMS 2</i>	Longitudinal Investigation of Cancer Biomarker Expression Levels Pre- and Post-Chemotherapy Treatment Using Multiplexed Proximity Ligation Assays	Albert Koong

Congratulations to all of our students, their mentors and to those who made the Research Symposium a success.

The Department of Dermatology's Update to the Executive Committee

On Friday, May 1st, Dr. Al Lane, Professor of Dermatology and of Pediatrics and Chair of the Department of Dermatology, provided an update on the department – a brief summary of which follows:

The Department of Dermatology was created in 1959 when the Medical School moved from San Francisco to Palo Alto. Currently the Department of Dermatology consists of 20 full-time faculty who are active at SHC, LPCH, Santa Clara Valley Medical Center and the Palo Alto Veterans Hospital. We also have 4 part-time faculty, 62 VCF, 16 residents, 16 postdoctoral fellows and 13 graduate students. The Mission of the Department of Dermatology is: *Sustained leadership in scientific investigation, patient care, and in training future leaders of our specialty in an environment that fosters creativity and synergy.* The faculty and staff in dermatology have continued to accomplish that mission.

Scientific leadership can be documented by international leadership in the number of high impact scientific publications over the past seven years. In addition, we have consistently been ranked one of the top five programs in the USA for NIH funding. Our research has focused on translating discoveries in the area of skin cancer pathogenesis, skin aging and regeneration, skin inflammation and genetic skin disease correction. We have developed teams of researchers and clinicians in each of these areas.

Patient care excellence can be documented by the specialty clinics, which focus on Cosmetic Dermatology, Genital Dermatology, Immunobullous Diseases, Pigmented Lesions, Dermatology Surgery, Cutaneous Autoimmunity, Cutaneous Lymphoma, Melanoma, Epidermolysis Bullosa, Genetic Skin Diseases, and Vascular Anomalies. In addition, our adult dermatology clinical care opportunities have greatly expanded with the move to Redwood City in the Stanford Medicine Outpatient Center. Many of the specialty clinics are multidisciplinary in that they also include physicians from many medical disciplines so that the patient may receive a comprehensive evaluation at the same visit.

The Department of Dermatology focus on training future leaders has been successful over the past 15 years. During that time 32% of the graduated residents maintain faculty appointments at major medical schools. The graduate student and postdoctoral trainees are also in academic and industry leadership positions. The residency program is one of the most competitive and most successful in the country.

The Department of Dermatology currently is expanding clinical, research and educational opportunity by developing improved synergy and redundancy in areas of current success and expanding into new opportunities.

Notable Events:

- ***Honoring Major Contributors to the Li Ka Shing Center for Learning and Knowledge:*** On Thursday, April 30th, we held an event for donors who made exceptional contributions for the Li Ka Shing Center for Learning and Knowledge. They toured the facility and heard presentations about how this

wonderful facility will be such a transformative feature for the future education of our students and community. The LKSC will open for education functions in the late summer of 2010. Special thanks to Bruce Bingham and members of the Office of Medical Development for organizing this event.

- ***Fifty Years of Support from the Baxter Foundation to Stanford University:*** On Wednesday, May 6th we had the opportunity to honor the Baxter Foundation for its 50 years of support for Stanford Medicine. It has been an extraordinary relationship during which the Foundation has provided more than 10 million dollars that has supported over 140 Med Scholar students, more than 65 junior faculty, over a dozen graduate students, two full scholarships for medical students, an endowed professorship and laboratory and resources and equipment to support the school's missions. In addition to their monetary contributions, the active Foundation Board Members: Donald Haake, Martha and Richard Haake and Jane Haake Russell and James Russell, have been deeply involved in meeting with students and faculty over the years and have very much become part of the Stanford family. We are deeply appreciative to the Baxter Foundation, and I too have appreciated my relationship with Don, Martha, Dick, Jane and Jim and for all they have done for our students and faculty and for Stanford Medicine.
- ***Remembering Ralph Joshua Spiegl, MD.*** On Thursday, May 7th we remembered the life and contributions of Dr. Ralph Spiegl, MD'48 in a service at the Stanford Memorial Church. Dr. Spiegl was an extraordinary physician who embodied the attributes and values we can only hope to instill in our students today. He was also exceptional member of the Stanford University and Medical School community – honored by the Golden Spike Award and the Dean's Medal for his incredible dedication and contributions. He will be deeply missed.

Awards and Honors

- ***The Stanford Human Research Protection Program (HRPP)*** has been awarded continuing full "Accreditation" by the Association for the Accreditation of Human Research Protection Programs (<http://www.aahrpp.org>). This is a triennial process which, thanks to the leadership of Kathy McClelland, Ann Arvin and the faculty and staff involved in human subject research, Stanford passed with "flying colors." In fact the AAHRP reported that Stanford met five accreditation elements with distinction – an additional honor for the University and our institutional leaders.
- ***Dr Ann Arvin***, Vice Provost and Dean of Research, Lucile Salter Packard Professor of Pediatrics and Professor of Microbiology and Immunology, received the Pediatric Infectious Disease Society Distinguished Physician Award for 2009. This is a wonderful honor and is richly deserved by Dr. Arvin.
- ***Dr. Jonathan Berek***, Professor and Chair of the Department of Obstetrics and Gynecology, has been elected the President-Elect of the University Chairs of Obstetrics and Gynecology. A wonderful leadership accomplishment!

- **Dr. Shreyas Vasanawla**, Assistant Professor of Radiology, has won the Caffey Award for the Outstanding Basic Science Research Paper at the Society of Pediatric Radiology. This is a coveted award and we congratulate Dr. Vasanwala.
- **Dr. Sam So**, the Lui Hac Minh Professor in the Department of Surgery, will be honored on May 14th by the California Asian Pacific Islander Joint Legislative Caucus for his accomplishments, which include leading the Asian Liver Center and program at Stanford.
- **Yi-Rren Chen**, SMS 2, is the recipient of the Alpha Omega Alpha (AOA, a Medical Honor Society) Student Research Award – a wonderful honor.
- **Marlene Martin**, SMS 2, is the winner of the AMA Foundations Minority Scholars Award; this award is given to only ten students a year across the country to recognize their commitment to minority health.

Congratulations to all!

Appointments and Promotions

- **Michelle Barry** has been appointed to Professor of Medicine, effective 5/01/09.
- **Julie C. Baker** has been promoted to Associate Professor of Genetics, effective 5/01/09.
- **Todd Brinton** has been appointed as Clinical Assistant Professor of Medicine, effective 4/01/09.
- **Michael W. Brook** has been promoted to Clinical Assistant Professor of Anesthesia, effective 4/16/09.
- **Fidelia Yuan-Shin Butt** has been reappointed as Clinical Assistant Professor of Otolaryngology – Head and Neck Surgery, effective 7/01/09.
- **Cheryl Cho-Phan** has been reappointed as Clinical Assistant Professor of Medicine, effective 5/01/09.
- **LaVera Crawley** has been reappointed to Assistant Professor (Research) of Pediatrics, effective 6/01/09.
- **Mark Cullen** has been appointed to Professor of Medicine, effective 5/01/09.
- **Rhiju Das** has been appointed to Assistant Professor of Biochemistry, effective 5/01/09.
- **Manisha Desai** has been appointed as Clinical Associate Professor of Medicine, effective 7/01/09.

- **Brian Hargreaves** has been reappointed to Assistant Professor of Radiology, effective 5/01/09.
- **Michael Hsieh** has been appointed to Assistant Professor of Urology, effective 8/15/09.
- **Kai Ihnken** has been promoted to Clinical Associate Professor of Cardiothoracic Surgery, effective 5/01/09.
- **Robert Jack** has been reappointed as Clinical Associate Professor of Ophthalmology, effective 9/01/08.
- **Malcolm MacDonald** has been promoted to Clinical Associate Professor of Cardiothoracic Surgery, effective 10/01/08.
- **Samuel A. Mireles** has been appointed as Clinical Assistant Professor of Anesthesia, effective 8/01/09.
- **Rajorshi Mitra** has been promoted to Clinical Associate Professor of Orthopaedic Surgery, effective 5/01/09.
- **Garry P. Nolan** has been promoted to Professor of Microbiology and Immunology, effective 5/01/09.
- **Echo Rowe** has been appointed as Clinical Assistant Professor of Anesthesia, effective 8/01/09.
- **Debora L. Sawyer** has been reappointed as Clinical Assistant Professor of Obstetrics and Gynecology, effective 5/01/09.
- **Davud Sirjani** has been appointed as Clinical Assistant Professor of Otolaryngology – Head and Neck Surgery, effective 8/17/09.
- **Roy M. Soetikno** has been appointed as Clinical Professor of Medicine, effective 1/12/09.

Dean's Newsletter

May 26, 2009

Continuing Economic Challenges and Their Impact on the Medical School Community.

In my newsletter of March 30, 2009 (see: http://deansnewsletter.stanford.edu/archive/03_30_09.html#4), I outlined many of the significant financial actions we have taken to preserve the School's key programs and positions, while at the same time acknowledging the need to reduce our overall expenses. At that time, I indicated some layoffs within our administrative areas would be necessary to bring our expenditures into balance with our resources.

With that in mind, our administrative units, Institutes and Centers were asked to accelerate the budget preparation process for FY10 and to propose further budget reductions, including potential reductions in workforce. Those decisions have now been made - as difficult as they were - and budget decisions for those units have been finalized. As a result, we have had to make some very hard decisions to reduce our administrative workforce. A total of 40 staff will be affected either through layoff or reductions in time. This is approximately 7% of our administrative staff workforce in the Dean's Office units. These administrative layoffs, due to budgetary constraints, are being formally communicated to all affected individuals early this week and will become effective June 1st. Individuals whose positions have been eliminated will receive the University's enhanced layoff benefits, which will provide some additional support and resources during this challenging time.

I am saddened that we are in the midst of an economic situation that leads us to eliminating staff positions. Reducing staff through layoffs has a profound impact on all of us and these decisions were not made lightly. As I have underscored before, the School is most fortunate to have a very hard-working, talented and dedicated staff who have given many years of their career to supporting our missions. The elimination of these positions not only affects the individual employee and his/her family, but also deeply affects the morale and engagement of the staff who remain in their positions. Accordingly, I ask that all managers and supervisors work closely with those entrusted to your leadership, acknowledge the contributions made by all of your employees, make them feel heard and valued and encourage their continued efforts in support of our important missions.

As we continue to experience unprecedented fiscal challenges, we cannot guarantee that this marks the end of staff reductions, the need to place critical programs on hold or delays in some of our capital expansion plans. While we are doing our best to support our faculty, students and staff, financial challenges may cause us to make further unwelcome but necessary choices. In the meantime, every effort is being made to keep the school financially stable, identify new revenue streams and shore up our financial resources.

I appreciate your support and dedication, and I know that together we will weather this storm and continue as a world-class institution for years to come.

Updated Website on Stanford Industry Interactions Policy (SIIP)

I have communicated frequently about industry relations and conflict of interest. Over the last several years a number of organizations have proposed conflict of interest policies, the most recent and comprehensive being the Institute of Medicine of the National Academy of Sciences. While the IOM document that was released on April 28, 2009 is quite detailed (see: <http://www.iom.edu/CMS/3740/47464/65721.aspx>) a helpful synopsis is available in the May 21st *New England Journal of Medicine* (2009;360: 2160 – see: <http://content.nejm.org/cgi/content/full/360/21/2160>). While the IOM report and those from other organizations (including the Association of American Medical Colleges [AAMC]) chart a path toward regaining the public trust, Stanford has provided a number of directional signals over the past several years and has helped to stimulate a number of these important changes. To that regard, I want to bring to your attention the updated Stanford Industry Interactions Policy (SIIP), which has been posted on the School's web site at <http://med.stanford.edu/coi/siip/policy.html>.

As many of you know, we implemented this policy in October 2006. It governs interactions, largely in the clinical and educational arenas, with the pharmaceutical, biotech, medical device, and hospital and research equipment and supplies industries. The policy includes provisions regarding, among other issues, gifts from industry, access of sales and marketing representatives to our campus, and industry support of education.

In recent months, the policy has been updated to include, among other changes, our CME Commercial Support Policy (http://cme.stanford.edu/commercial_support.html), which was introduced in 2008. Greater clarity concerning participation in meetings or conferences supported by industry has also been provided, including an explicit provision that participation by Stanford faculty in so-called speakers bureaus is contrary to the policy.

SIIP continues to be the defining document for our interactions with industry in the clinical care and educational areas. Policies covering interactions with industry in the research area can be found at the School's Conflict of Interest web site (<http://med.stanford.edu/coi/overview.html>). Given the prominence of these issues in the public domain and the changing landscape of conflict of interest, it is important that we maintain the currency of these policies and that all of us assure that our own interactions with industry comply with their provisions. Thank you for your continuing attention to this important area.

Senior Transitions Website Goes Live

In previous Newsletters I have reported on the work of the Senior Faculty Transitions Task Force (http://deansnewsletter.stanford.edu/archive/07_09_07.html#7, http://deansnewsletter.stanford.edu/archive/08_25_08.html#4), which was chaired by Dr.

Gary Schoolnik, Professor of Medicine and now Associate Dean for Senior Faculty Transitions. This group developed recommendations about policies, procedures and resources through which advice and guidance could be provided to senior faculty about career and life planning. A key recommendation of the Task Force was the development of a web site to be a readily accessible, centralized information source related to senior faculty transitions. I am very pleased to report that the initial phase of this web site is launching today, at: <http://med.stanford.edu/academicaffairs/senior-faculty>

In addition to providing information about the work of the Task Force, including the results of a survey of all School of Medicine active and emeriti faculty age 50 and above, the site provides information about retirement as well as financial planning resources available at Stanford. Additional information will be added over the coming months. In the meantime, I hope you will find the information assembled on this web site to be helpful and informative. Special thanks to Kristin Goldthorpe, Project Manager in the Dean's Office, for her efforts in bringing the site to fruition.

Update on NIH Funding

On Tuesday, May 19th, Dr. Raynard Kington, Acting Director of the NIH, gave an update to the Board of Directors Meeting of the Foundation for the NIH (of which I am a member). He commented on the 1.4% (\$443M) increase in the NIH budget proposed by the Administration for FY10 as well as the status of the \$10.4 billion allocated to the NIH through the American Recovery and Reinvestment Act (ARRA) of 2009.

As proposed, the FY10 NIH budget would fund 9,849 new Research Project Grants (RPG) and would bring the total number of RPG's to 38,042. A success rate of 20 percent is currently projected. This is independent of the ARRA funding – of which \$8.2 billion is allocated for research. I previously commented on Stanford submissions for the NIH Challenge grants, which totaled over 200 in number (http://deansnewsletter.stanford.edu/archive/04_27_09.html#4). While that is impressive, Dr. Kington noted that NIH received over 22,000 applications for these Challenge Grants (of which 200 are to be awarded – although he noted that the number of these grants may be increased). Clearly this is an amazing response and while it makes the probability of achieving a successful application quite low, it underscores the vast wellspring of ideas that have been waiting to come forward and that have been “stimulated” by the renewed interest in science and technology from the Obama Administration.

Interdisciplinary Research Planning Activities

Over the past two weeks a number of faculty-initiated interdisciplinary planning activities have taken place to promote research interactions and opportunities. Three events have occurred (there are likely others I am not familiar with) that brought faculty from across the university together to share ideas and forge new collaborations. These kinds of activities are what make Stanford such a unique environment. They included:

- *A Panoramic Collaborative: Broad Look at Multidisciplinary Vision Science at Stanford* sponsored by the Stanford Center for Vision and the Prevention of

Blindness, the Department of Ophthalmology, and the Stanford Institute for Neuro-Innovation and Translational Neurosciences.

- ***The Stanford Clinical Genomics Retreat*** organized by Euan Ashley, Assistant Professor of Medicine (Cardiology) in conjunction with the Center for Genomics and Personalized Medicine, which will be led by Dr. Mike Snyder after he arrives this summer to lead the Department of Genetics. More than 50 faculty attended this Retreat and focused on issues ranging from technology development and deployment to informatics and opportunities for translational research at Stanford.
- ***The Global Health Symposium*** organized by Dr. Julie Parsonnet, George DeForest Barnett Professor in Medicine and Professor of Health Research and Policy (Epidemiology), which featured interactive sessions on ethics in global health research and on overcoming obstacles to healthcare implementation. The Symposium also introduced Dr. Michele Barry, who joined Stanford on May 1st as Senior Associate Dean for Global Health.

My thanks to the faculty who initiated these activities and to all who participated in them. I am confident that new insights, interactions and discoveries will ensue!

AAMC Faculty Forward Program Survey

Back in March, we announced Stanford's participation in the AAMC initiative, *Faculty Forward*. The centerpiece of this initiative is a faculty satisfaction survey developed by the AAMC and the Collaborative on Academic Careers in Higher Education (COACHE) at the Harvard Graduate School of Education. By now all faculty should have received one or more emails from AAMC/COACHE with a link to participate in the survey. Some of you may remember completing a similar survey in 2007 and might wonder what the advantage is of completing yet another survey on faculty satisfaction. We take the results from each survey very seriously and use them to make specific improvements that will positively impact all faculty.

For example, the 2007 survey alerted us to the need for a better process of providing faculty with career feedback. In response to this need, we are currently piloting a new feedback process through the Faculty Fellows program. After refining this process, we will implement it more widely around Stanford. In addition, results on the 2007 survey told us that many faculty feel that their teaching and clinical activities are not adequately recognized and rewarded. This led to a detailed discussion at the past Dean's leadership retreat on how to put in place reward systems that fully recognize the value of teaching and clinical activities. We developed a focused plan that will be implemented over the next year; in addition, we have worked with Faculty Affairs to revise the current criteria for advancement and promotions in order to place additional value on teaching and clinical activities. We plan to revise the criteria further in order to place greater value on interdisciplinary work.

As you can see, we use your feedback on our faculty satisfaction surveys to develop concrete strategies for creating a supportive culture for all faculty. However, your continued participation is essential in helping us achieve this goal. This is why I encourage your participation in the 2009 survey. As added thanks, we will give away ten \$50.00 gift certificates at random to faculty who complete the survey. The last day to complete the survey is June 30, 2009.

To complete the survey, look for an email in your inbox that originates from "Faculty Forward" <coache@gse.harvard.edu>. The subject line for this email is "AAMC-COACHE Medical School Faculty Job Satisfaction Survey."

Awards and Honors

- Dr. John Cooke, Professor of Cardiovascular Medicine, was awarded the designation of Master of the Society for Vascular Medicine in recognition of extraordinary service, selfless dedication and enlightened leadership to the SVM and the field of vascular medicine" on May 14, 2009. Congratulations, Dr. Cooke.
- Bikul Das, a postdoctoral scholar in the Department of Medicine, recently received a grant from the Bill and Melinda Gates Foundation to explore the role of stem cells in the management of tuberculosis. Congratulations, Dr. Das.
- Dr. Renee Reijo Pera, Professor of Obstetrics and Gynecology and Director of the Center for Human Embryonic Stem Cell Research and Education, received an honorary degree at the University of Wisconsin-Superior, her alma mater. She was recognized for her accomplishments involving the study of human development and reproduction, and her pursuit of knowledge that could make fertility treatments safer for women and prevent birth defects.

Appointments and Promotions

Rebecca Bernard has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Child Psychiatry), effective 6/01/09.

Darrell Brooks has been promoted to Clinical Assistant Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 6/01/09.

Michelle Brown has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Child Psychiatry), effective 3/01/09.

Michael Joshua Cisco has been appointed as Clinical Assistant Professor of Pediatrics (Pediatric Cardiology), effective 7/01/09.

Stephen D. Coleman has been appointed as Clinical Assistant Professor of Anesthesia (Pain Management), effective 7/01/09.

John Dani has been appointed as Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 5/01/09.

Gail Gullickson has been reappointed as Clinical Associate Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08.

Dora Ho has been reappointed as Clinical Assistant Professor of Medicine (Infectious Diseases), effective 8/01/09.

Meghan Imrie has been appointed as Clinical Assistant Professor of Orthopaedic Surgery, effective 9/01/09.

Peter Henry Johannet has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 6/01/09.

Kenneth K. Kim has been reappointed as Clinical Assistant Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 6/01/09.

Abha Barry Kumar has been reappointed Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 4/01/09.

Robert M. Menard has been reappointed Clinical Assistant Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 6/01/09.

Kelly Murphy has been promoted to Clinical Associate Professor of Surgery (Emergency Medicine), effective 12/01/08.

Chad D. Pritts has been appointed as Clinical Assistant Professor of Anesthesia (Critical Care Medicine), effective 7/01/09.

Daryn Reicherter has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Child Psychiatry, Psychopharmacology and Mood Disorders), effective 6/01/09.

Monica Stemmler has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Ambulatory Pediatrics), effective 7/01/09.

Joyce Tenover has been appointed as Clinical Professor of Medicine (Gerontology and Geriatric Medicine), effective 1/20/09.

Arthur Traum has been reappointed as Clinical Associate Professor (Affiliated) of Medicine (General Internal Medicine), effective 9/01/08.

George Triadafilopoulos has been reappointed as Clinical Professor of Medicine (Gastroenterology and Hepatology), effective 9/01/08.

Mirjana Vustar has been appointed as Clinical Assistant Professor of Anesthesia (Pediatric Anesthesia), effective 7/01/09.

Katherine Warner has been reappointed as Clinical Assistant Professor of Ophthalmology, effective 4/10/09.

Justin Yeh has been appointed as Clinical Assistant Professor of Pediatrics (Pediatric Cardiology), effective 7/01/09.

Dean's Newsletter

June 8, 2009

Fifty Years for Stanford Medicine in Palo Alto

On Friday, May 29th the School of Medicine celebrated the Fifty Year Anniversary of its 1959 move from San Francisco to the Stanford Campus. We also had the opportunity to honor three remarkable individuals who helped shape the medical school and medical center during the past 50 years and whose contributions continue to influence its on-going transformation into the future. Comments about these three pioneering leaders, Dr. Robert Glazer, Dr. Larry Crowley and Mr. Lorry Lokey, are noted later in this Newsletter. In my introduction to the award ceremony I briefly reviewed some of the factors that led to the decision to move the medical school to the Stanford campus and the impact this had on Stanford Medicine. I also touched on some of the individuals and decisions from earlier in our history that set the stage for the bold step the School of Medicine and Stanford University took in 1959.

To a significant degree history is a reflection of the experiences of individuals and of the influence of external forces on individual goals at specific points in time and place. Individuals with vision shape institutions. A lack of vision in a changing environment results in passive and reactive responses rather than proactive decision-making and can thus passively impact institutions. To a degree Stanford Medicine as we know it today is the result of a conjunction of internal and external forces that began to emerge in the mid-1940s. At that time the School of Medicine, which had become part of Stanford University in 1908, was in need of restoration and renewal. Indeed, when Donald Tressider became President of Stanford in 1943, he learned of a plan to restore the Medical School campus in San Francisco through a major fundraising campaign (the "Endowment Campaign") that had been put together by his predecessor Ray Wilbur (who had served as Dean of the School of Medicine prior to becoming President of Stanford). Because the necessary funds had not been raised, Tressider (who like David Star Jordan and Ray Wilbur before him, held an MD degree) appointed a committee to assess the plans for the medical school.

In 1946 this committee, led by Dr. Harold Faber (a pediatrician) recommended that the Stanford Medical School in San Francisco be restored and renewed. There was much

support for this by the clinical faculty, whose practices were located in San Francisco. However, in the absence of funds, no progress was made, and in 1948 President Tressider put the medical school plans “on hold” for the next five years. Shortly thereafter, President Tressider and Loren “Yank” Chandler, who served as Dean of the Medical School from 1933-1953, became interested in integrating the medical school into the university, despite major objections from the clinical leaders and faculty. They toured a number of other medical centers, including Illinois, Cornell, Duke and Michigan, and, as a result, concluded that plans to move the medical school could not proceed until greater clinical opportunities for teaching and patient care activities were available in Palo Alto.

In 1948, Wallace Sterling succeeded Tressider as President of Stanford and soon thereafter the future of the medical school was raised once again. In 1951, the Board of Trustees affirmed the recommendation of the Faber Committee to renew and restore the medical school in San Francisco. A year later, in 1952, Sterling appointed yet another committee to evaluate the future of the medical school. It included a number of prominent faculty leaders, including Yank Chandler (Dean), Arthur Bloomfield (Professor of Medicine), Windsor Cutting (Professor of Pharmacology), William Greulich (Professor of Anatomy), Henry Kaplan (Professor of Radiology), William Northway (Professor of Medicine), Victor Richards (Professor of Surgery) and Lowell Rantz (Associate Professor of Medicine). The Sterling Committee once again surveyed the options and opportunities and once again affirmed prior decisions to keep the medical school in San Francisco.

But behind the scenes President Sterling and the Board of Trustees undertook a parallel process that resulted in the announcement, on July 15, 1953, of the decision to move the School of Medicine to the Stanford campus in Palo Alto. Clearly this was a visionary decision. But it came with a cost: the clinical faculty leaders in San Francisco reacted very negatively, and most would elect not to move to Palo Alto. And it was not met with a great degree of enthusiasm by clinical physicians practicing in Palo Alto, who viewed the coming of Stanford as a threat to their own futures. Nonetheless, the decision was made and the future of Stanford Medicine was defined – with the result that 50 years later, the School of Medicine is one of the leading research intensive medical schools in the world, a destiny that almost surely could not have been accomplished if the conventional wisdom of the time to leave the school in San Francisco had been followed.

With the decision to move the School to the Stanford campus made, many other important decisions followed. Among these were: the need to construct a new medical center on the Stanford campus; the development of a new curriculum for medical education; and further development of the full-time faculty program that had begun earlier in the century and that had been endorsed by the Flexner Report of 1910. In 1956 Edward Durrell Stone, an internationally recognized architect in the 1950s, received the commission to design the integrated medical school and hospital facilities (the latter done in conjunction with the City of Palo Alto). Work soon commenced on a major renewal project that cost \$22 million at the time of its completion in 1959. While there is considerable debate today about the utility and design of the ED Stone complex, at the

time it was viewed by many as “state-of-the-art,” with its attempts to provide a rustic setting that echoed, in part, the sandstone feeling of the main campus.

Acknowledging herewith that the design left many problems, it did accomplish one unique and critically important goal: it brought together the medical school and teaching hospital into an integrated whole, while locating them proximate to the university campus and especially the Schools of Engineering and Humanities and Sciences. Indeed, it was this unique co-location that gave Stanford its character. This type of integration is not typical for US medical schools and medical centers, but it has defined Stanford and helped create and foster opportunities for basic, clinical and translational research, often interdisciplinary, that would not otherwise have been possible or achievable.

While facilities are important in defining institutions, it is of course the quality of the individuals who occupy them that has the greatest impact. Here a challenge was replaced by an opportunity. With the decision of many of the Stanford faculty leaders to stay in San Francisco and the move of the school planned for 1959, the need to recruit new leaders became a major issue. A number of individuals played critical roles in this early recruitment process, most notably President Sterling, Provost Fred Terman (who played such a critical role in shaping Stanford’s role as an innovator and incubator), Robert Alway (who became Dean in 1957) and Henry Kaplan. Individually and together they helped attract the founding faculty leaders for the transition of the medical school – and quite a group this turned out to be, since its members not only shaped Stanford but also science and medicine around the world for decades to come.

They included Arthur Kornberg, who brought his whole department from Washington University to found a new Department of Biochemistry at Stanford. Shortly after his arrival, Dr. Kornberg won the Nobel Prize, creating immediate notoriety for Stanford. Dr. Joshua Lederberg was recruited from Wisconsin to found a new Department of Genetics. His decision to join Stanford was influenced, in part, by the fact that Kornberg had come to Stanford – and, since Lederberg had won a Nobel Prize in 1958, the newly “re-founded” school had two Nobel Laureates among its newly burgeoning faculty. Other important leaders who soon joined Stanford included Drs. Norm Kretchmer, who came from Cornell to lead Pediatrics, Hal Holman from Rockefeller University to lead Medicine, Robert Chase from Yale to lead Surgery and David Hamburg from the NIH to lead Psychiatry. Henry Kaplan and Avrum Goldstein, both of whom came from the San Francisco campus, along with a young surgeon, Norman Shumway, joined this remarkable group of leaders. Each of these individuals had remarkable careers in his own right, and both individually and collectively they helped shape the culture and fabric of Stanford Medicine as we know it today.

As is also well known, history runs in cycles and, not infrequently, issues seem to recur – sometimes more than once. Today, as we celebrate Fifty Years of Stanford Medicine in Palo Alto, controversy has again emerged around the plans to renew and expand the clinical facilities at Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital – both of which have evolved considerably during the past 50 years. While the community in Palo Alto and beyond recognizes the unique importance of these medical

facilities to their community and their own families, the Palo Alto City Council has seemed to do everything possible to derail the plans for moving forward with exciting new hospital facilities that would surely shape the future of medical care for decades to come. The current City Council of Palo Alto seems to be out of sync with the community and, worse, to have a need to layer the currently already extraordinarily expensive projects with requests that have little to do with the proposed plans. I won't go into all the details here except to say that, not unlike some of the voices of the past, were those of the City Council to prevail, the future of Stanford Medicine would be negatively impacted and the benefits that would otherwise accrue during the decades ahead could be lost or severely diminished. Amazingly, even suggestions that the hospitals should be relocated to another site have once again found their way to the agenda.

This brings me back to the beginning of this story and our 50 Year Celebration. It was the courage and vision of a small handful of leaders – especially President Wallace Sterling and members of the Board of Trustees – who despite opposing forces made what in retrospect was the extraordinary decision to co-locate the School of Medicine and Medical Center into an integrated complex housed on the University campus. That same courage and vision today will sustain what has made Stanford Medicine unique and successful and will provide a home for future innovation and discovery, the education and training of leaders in science and medicine, and the translation of knowledge from research to the benefit of adults and children locally and globally. Sustaining the core values that has brought us to this momentous juncture in history will assure that Stanford Medicine will continue to be a beacon of hope and excellence well into the 21st Century.

Tributes to the 2009 Dean's Medal Recipients

We were fortunate to have three distinguished members of the Stanford community introduce each of our 2009 Dean's Medal recipients. Stanford's President John Hennessy introduced Mr. Lorry Lokey; Professor of Biochemistry Emeritus Paul Berg introduced Dr. Robert Glaser; and Stanford President Emeritus and Professor of Biological Sciences Emeritus Donald Kennedy introduced Dr. Crowley. In their remarks they highlighted the many accomplishments of the awardees – which are also described below – but, more than that, they conveyed their deep respect, gratitude and abiding affection for these remarkable individuals.

- *Dr. Berg remarked of Dr. Glaser, "there is no more worthy a recipient [of a Dean's Medal] than Dr. Glaser." He went on to praise Dr. Glaser's negotiating skills, his ability to solve problems "with great skill, forbearance and persistence," his prolific scholarship, and his "lifetime of achievement to the University, to medicine and [to] the nation."*
- *President Kennedy described Dr. Crowley as a "peacemaker... a negotiator... an imaginative renovator of relationships...a resolver of new challenges... a family guy," and, finally, as "one of the earth's truly splendid people."*

- *President Hennessy highlighted Mr. Lokey's extraordinary generosity, not only to Stanford University and specifically the School of Medicine, but also to other institutions in other states. "Mr. Lokey is a visionary, he said, who understands key issues and whose farsightedness is a hallmark of his endeavors. He concluded by saying: "John F. Kennedy said, 'we need men who can dream of things that never were' – certainly Lorry Lokey is such a man.'"*

We are deeply appreciative of all that Mr. Lokey and Drs. Glaser and Crowley have done for the School of Medicine – and for the world.

The citations for the Dean's Medals Awardees follow:

Robert J. Glaser, MD

Robert J. Glaser, MD, professor emeritus of medicine, is presented the Dean's Medal in recognition of his many years of leadership and service to the School of Medicine, as well as his numerous achievements in medicine and longstanding commitment to medical education.

Dr. Glaser was born in St. Louis, Missouri, on September 11, 1918. He was inspired to begin a career in medicine after spending a significant portion of his childhood in and out of hospitals due to congenital health issues. He received his MD, magna cum laude, at the Harvard Medical School in 1943, and went on to train in Internal Medicine at Barnes Hospital in St. Louis and the Peter Bent Brigham Hospital in Boston, Massachusetts.

He began his career as a National Research Council Fellow in the Medical Sciences, Washington University, studying experimental Group A streptococcal infections and their link to rheumatic fever. Dr. Glaser's extensive research in this area built an important understanding for him of the link between the basic sciences and the possibility of groundbreaking medical discoveries. When he moved to the University of Colorado in 1957 as Vice President for Medical Affairs, Dean of the Medical School, and professor of medicine, he carried this belief with him, and was instrumental in raising the bar on the quality of the faculty in basic sciences and other areas, as well as securing the funding for a new teaching hospital. He continued his career in administration from 1963 to 1965 as President of the Affiliated Hospitals Center, a consortium of Harvard teaching hospitals, and Professor of Social Medicine, moving to Stanford in 1965 as Vice President for Medical Affairs and Dean of the School of Medicine.

While at Stanford, Dr. Glaser played an integral role in interfacing with the city of Palo Alto to purchase their owned shares in the hospital, thereby making possible the development of Stanford Hospital & Clinics as a key part of Stanford Medical Center. During his tenure, Dr. Glaser also completed a comprehensive master plan for the School of Medicine, as well as building and strengthening academic programs throughout the school.

Dr. Glaser has also had a great impact on philanthropy through his leadership efforts with three medically oriented foundations: the Commonwealth Fund, the Henry J. Kaiser

Family Foundation, and the Lucille P. Markey Charitable Trust. He has also served as a member of the Board of Trustees at the David and Lucile Packard foundation and the Packard Humanities Institute, and been a valued member of this community in many ways.

Lawrence G. Crowley, MD

Lawrence G. Crowley, MD, professor emeritus of surgery, is presented the Dean's Medal in recognition of his leadership contributions to Stanford University, the School of Medicine, and to the community as a whole.

Dr. Crowley was born in Newark, New Jersey in 1919, and received both his BA and MD from Yale University. He completed his residency in General Surgery at the Yale-New Haven Hospital, and had his first teaching position as an assistant professor of Surgery at Yale Medical School before moving on to spend ten years as a part-time assistant clinical professor of surgery at the University of Southern California School of Medicine (USC).

While at USC, Dr. Crowley managed to juggle his position at the university with a private practice in surgical oncology along with numerous community projects. His most notable community contribution was to Casa Colina, a former Polio rehabilitation facility. After polio was eradicated by the development of a vaccine by Jonas Salk in the early 1950s, Dr. Crowley worked with the board and persuaded them to broaden their services to care for patients of all ages with all kinds of physical injuries and disabilities.

Casa Colina has been recognized throughout the nation as the first to introduce many of the modalities that are implemented in rehabilitative care today, as well as the first rehab center to offer a complete range of care for those with brain injuries and other neurological trauma.

Dr. Crowley first came to Stanford as professor of surgery in 1964, and left to become dean of the University of Wisconsin School Of Medicine from 1974 to 1978. He returned to Stanford as acting dean of the medical school, and in 1979 was appointed vice president for medical affairs at Stanford. Of his many contributions to the medical center, his efforts as a champion of the new children's hospital are some of the most significant.

Dr. Crowley and Lucile Packard both felt that the time had come to replace the Stanford Convalescent Home with a more advanced facility for children's care, particularly since the types of diseases affecting children now required far more than rest and recuperation.

Dr. Crowley also argued strongly to attach the children's hospital to the existing Stanford University Hospital, rather than rebuilding on the original site of the convalescent home. During the last decade, the Lucile Packard Children's Hospital has grown to become one of the leading centers of excellence in pediatric medicine and surgery, and Dr. Crowley's foresight was instrumental in the success of this important partnership.

Dr. Crowley's other honors include the Certificate of Merit from the American Cancer Society and a Stanford University Distinguished Service Award, and the Lawrence

Crowley, MD Endowed Professorship in Child Health was named in recognition of his contributions to Stanford.

Lorry I Lokey, '49

Lorry I. Lokey, '49 is presented the Dean's Medal in recognition of his humanitarian, philanthropic and leadership contributions to Stanford University, the School of Medicine, and the community at large.

Lokey, a native of Portland, Oregon, graduated from Stanford in 1949 with a degree in journalism and credits the university with jumpstarting his career. As a student, he started as a cub reporter for the Stanford Daily and eventually went on to become the editor, sparking a lifelong passion for reporting.

After graduation Lokey went to work at United Press (which later became United Press International), one of the country's major wire services. After a series of jobs in newspapers and public relations, he got the idea to start a new kind of wire service where, instead of going out and getting the news, the news would come to him.

He launched Business Wire in San Francisco in 1961 with \$2,000 of his own money. It quickly grew to become a news industry powerhouse, now distributing an average of 17,000 corporate and academic press releases a month. When Lokey sold the business in 2006 to Berkshire Hathaway, a company controlled by investor Warren Buffett, it was valued at roughly \$500 million.

A dedicated supporter of teaching and science, Lokey has donated roughly \$300 million to various educational institutions, including Stanford, the University of Oregon, Mills College in Oakland, the Technion-Israel Institute of Technology in Israel and his elementary school in Oregon.

He has recently made significant investments in science and biotechnology, believing they may offer the tools to put an end to major human ailments, such as heart disease and cancer. After the Bush administration limited federal funding for stem cell research in 2001, discouraging the study of these potentially powerful cells, Lokey turned his attention to this cutting-edge field.

Lokey's contribution to the School of Medicine—its largest single gift to date from an individual—has launched construction of the Lorry I. Lokey Stem Cell Research Building, a new stem cell laboratory facility on campus where scientists will probe the power of these elusive cells in treating conditions as diverse as cancer, stroke and diabetes. His generosity and commitment to this project speak to his personal conviction that stem cell research is incredibly important and that he wants to do all he can to help support its development—at both a basic and an applied level.

Five Years for the Stanford Cancer Center

On June 4th Martha Marsh, CEO of Stanford Hospital & Clinics, and I hosted a reception to celebrate the five -year anniversary of the opening of the Stanford Cancer Center. This event provided an opportunity to thank the many members of our community, both faculty and staff, who have contributed to the success of the Cancer Center. As a facility

it provides state- of- the-art patient care in a compassionate, comforting and caring environment. But we also acknowledged that the treatments offered at the Center are – and will continue to be – shaped by the innovations and discoveries that our faculty make in understanding cancer and in developing new approaches to its diagnosis, treatment and prevention. This is where we excel. We also acknowledged the important milestone the Cancer Center achieved three years ago in becoming an NCI-Designated Cancer Center as well as the recent submission of our reapplication for this designation by our Cancer Center Director, Dr. Beverly Mitchell, the George E. Becker Professor in Medicine.

I want to acknowledge and express my appreciation for the important partnership the School of Medicine has had with the Stanford Hospital and Clinics at the Stanford Cancer Center and also to thank the wonderful contributions of our faculty and staff for the work they do to create knowledge and help patients facing the challenge of cancer.

Dr. Linda Clever Named Associate Dean for Alumni Affairs

I am very pleased to announce that Dr. Linda Clever will become Associate Dean for Alumni Affairs in September 2009. She will succeed Dr. Ross Bright, who has served admirably for more than 17 years. I would like to thank Dr. Bright for his extraordinary service to the School and Medical Center. During his tenure, the Alumni Association has become more inclusive– it now includes graduates of the MD, Masters, PhD and post-doctoral programs along with graduates of our training programs at Stanford Hospital and Clinics and the Lucile Packard Children’s Hospital (see:

<http://med.stanford.edu/alumni/>). Dr. Bright also championed and led the development of a publication for alumni – *Bench & Bedside* – that has already generated a positive response and considerable interest from our alums. I am deeply appreciative of his many efforts and know they will shape the Alumni Association for many years into the future.

Dr. Linda Clever is well poised to succeed Dr. Bright as Associate Dean for Alumni Affairs. She has been an active and enthusiastic member of the Board of Governors and has a long history of highly productive interactions with the School as well as its students and faculty. Dr. Clever is a graduate of Stanford University and the Medical School and is Board Certified in Internal Medicine and Occupational Medicine. She has served prominently in the American College of Physicians, including service as Chair of the Board of Governors and Regent. She has been elected to the Institute of Medicine of the National Academy of Sciences and has served on numerous boards including the Stanford University Trustees. In addition to her many professional and personal activities, Dr. Clever’s special interests include personal and organizational renewal, health care and the occupational health of women and health care workers. She brings considerable and notable skills as a leader in medicine and health care along with a deep commitment to Stanford, and I am pleased to welcome her as our Associate Dean for Alumni Affairs.

Another Warning About Protecting Patient Confidentiality

On May 15th the LA Times reported that the Kaiser Bellflower Hospital was fined \$250,000 for failing to keep employees from accessing the medical records of the mother who gave birth to octuplets in January (see: <http://www.latimes.com/news/local/la-me-privacy15-2009may15.0,2916906.story>). This is related to the two new laws aimed at protecting patient privacy and data security that I alerted you to in the December 15th Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/12_15_08.html#3). Failure to comply with these laws can result in individual as well as institutional fines ranging between \$25,000 and \$250,000. Based on some recent observations I fear I need to call this your attention again, and I cannot underscore more strongly how important it is to heed these regulations.

Specifically, privacy of patient information is central to the care that we provide at Stanford. You cannot access any patient record unless you have treatment responsibilities for the patient or you have another permissible need to know (such as supervision of your residents or quality-of-care reviews). ***This applies whether the individual is a friend, a colleague or even a family member; it is mandatory that you have either specific documented permission or a treatment related need to know before you access the record.***

Both LPH and SHC have increased their monitoring of access to patient records as a result of new federal and state mandates. As you know from my prior reports, under the new state law, if the Hospitals detect impermissible access to patient information, they are required to report it immediately to the State and to the affected patient(s), even if the person who accessed the record does not tell anyone else but viewed the record without a permissible reason. New federal law extends these reporting requirements to the School of Medicine (and any other part of the "HIPAA Covered Entity"); accordingly, privacy and security breaches will also need to be reported to the U.S. Department of Health and Human Services and to the affected patient(s). These laws are designed to increase the transparency of the practices of both institutions and individual health care providers, and, when a breach affects numerous patients, we will be required to report it to the media.

As I have noted, both federal and state authorities have new enforcement powers and can impose substantial penalties on both institutions and individuals, and state law permits patients to sue directly for a privacy breach – as is being done to the Kaiser Bellflower Hospital. Indeed, the State Department of Public Health is enforcing this authority, and in May, it imposed a fine of \$250,000 (the maximum) for failing to prevent inappropriate access to a patient's records. It also referred the matter to the state privacy office (California Office of Health Information Integrity) to determine if penalties will be imposed on the individuals involved.

If you have any questions about permissible access to patient information, please review the HIPAA privacy policies (found at http://hipaa.stanford.edu/policy_manual_university.html) or contact Dr. Todd Ferris, School of Medicine Privacy Officer (tferris@stanford.edu).

Professional Development Programs for Clinician/Educators

Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, has let me know that the Clinician-Educator Professional Development Leave Program becomes available for use on July 1, 2009. A Clinician-Educator is eligible to participate in the program if he/ she is appointed as a Clinical Assistant Professor, Clinical Associate Professor or Clinical Professor and his/her percent time of appointment (also referred to as full time effort "FTE") is 50 percent or more and his/her term of appointment is for six months or longer. Further information about the program and the relevant documents for its use are posted on the Office of Academic Affairs' web site at http://med.stanford.edu/academicaffairs/C~E_Benefits.html.

In addition to the Professional Development Leave Program, benefits-eligible Clinician-Educators (i.e., those with appointments of fifty percent time or more and with terms of appointment of six months or longer) are also eligible to take five working days per year of paid conference leave. Information about this leave can also be found at the Office of Academic Affairs web site, http://med.stanford.edu/academicaffairs/CEs/CE_benefitsSummary.pdf.

If you have questions concerning these programs, please contact Jane Volk-Brew in the Office of Academic Affairs, volkbrew@stanford.edu or (650) 862-3971. Questions regarding reimbursement for the Professional Development Leave should be directed to Sue Kingston in Faculty Compensation, skingston@stanford.edu or (650) 736-8544.

I encourage Clinician-Educators to inform themselves of these opportunities and to take advantage of them. Clinician-Educators are a key faculty group in advancing the mission of the School of Medicine, and their professional development is an important priority for the School - and for me.

The Department of Biochemistry's Update to the Executive Committee

On Friday, June 5th, Dr. Mark Krasnow, Professor and Chair of Biochemistry, provided an update on the department – a brief summary of which follows:

Fifty years ago this month, Arthur Kornberg, Paul Berg, Dave Hogness, Dale Kaiser, Bob Lehman, Mel Cohen and other members of the Medical Microbiology Department at Washington University moved here along with Buzz Baldwin from the University of Wisconsin to establish the Stanford Biochemistry Department. One of the key factors contributing to the success of the Department is the collegiality and friendship, and the remarkable stability of the faculty. With the exception of Mel Cohen who left early to found the Salk Institute, the founding faculty have remained together for their entire careers until Arthur's passing two years ago at age 89. And, in the entire 50 year history of the Department, only five of our 22 faculty have left. There are currently 10 full time faculty and five active Emeritus faculty, with \$21M grants (direct costs). We also have six

affiliated faculty who greatly enrich our intellectual environment and teaching: Gil Chu, Jim Ferrell, K.C Huang, Chaitan Khosla, Sharon Long, and Raj Rohatgi. There are 65 graduate students and 45 postdoctoral scholars in the Department, plus the Stanford Genome Technology Center, Stanford Microarray Database, and Stanford Functional Genomics Facility.

Six months after he arrived to Chair the new Department, Kornberg, at age 40, received the 1959 Nobel Prize in Physiology or Medicine for his pioneering work on the biological synthesis of DNA (shared with Severo Ochoa for RNA synthesis). The arrival of Arthur and new Department helped recruit Josh Lederberg, who had won the same Nobel the previous year, to found the Genetics Department. This thrust the new Departments and Stanford Medical School into national prominence, setting the stage for a remarkable 50 years of progress that transformed the Department, School and all of biomedical research. In addition to two Nobel Prizes, two Lasker Awards, and two National Medals of Science, nine of the 10 members of the Department age 55 and older have been elected to the National Academy of Sciences, an unparalleled record.

Each decade has been highlighted by a different research theme, alternating between basic discovery and technology. The 1960's were dominated by nucleic acid enzymology, culminating in 1967 in the enzymatic synthesis in vitro of an infectious phage by the Kornberg lab, which newspapers hailed as "creation of life in a test tube." That same year the Lehman lab reported the discovery of an enzyme that could link DNA chains by phosphodiester bonds. Availability of DNA ligase and other nucleic acid enzymes set the stage for the recombinant DNA revolution of the next decade.

The recombinant DNA revolution was launched by two papers by the Berg and Kaiser groups in 1972 and 1973 that reported the first recombinant DNA methods and molecules. The development of many other methods of recombinant DNA technology followed including isolating genes by screening genomic libraries and mapping genes on chromosomes (Hogness lab), expressing recombinant gene products (Berg lab), and Northern blots for RNA and Western blots for proteins (Stark lab). At the end of the decade, Ron Davis and collaborators including David Botstein (who would later join Stanford as Chair of Genetics) described a method for construction of a genetic linkage map in humans using restriction length polymorphisms, laying the conceptual foundation for mapping and identification of human disease genes and current Genome Wide Association Studies. At the end of the decade, Paul Berg received the Nobel Prize in Chemistry for his studies of the biochemistry of nucleic acids, with particular regard to recombinant DNA (shared with Wally Gilbert and Fred Sanger for DNA sequencing). Although the 1970's were dominated by technology development, there were also many crucial basic biochemical discoveries including the isolation of the recombination enzyme RecA by the Lehman lab and identification of protein folding intermediates by the Baldwin lab that helped launch the DNA recombination and protein folding fields.

The 1980's saw the application of recombinant technology to biochemistry, genetics and virtually all biomedical fields, transforming basic biomedical science departments and blurring the boundaries between them. The Hogness lab opened the molecular biology of development and molecular biology of human color vision, the Kaiser lab pioneered the molecular biology of microbial motility and development, and the Brutlag lab pushed

into bioinformatics. Hogness obtained a Markey grant to found the Department of Developmental Biology, and Berg lead the vision and fundraising for the Beckman Center for Molecular and Genetic Medicine. Although many in the Department veered far from Kornberg's love of enzymes and original vision for the Department, Jim Rothman, Suzanne Pfeffer, and their colleagues started the enzymology of vesicular trafficking and intracellular protein transport that transformed the field of cell biology.

The 1990's were highlighted by two technological revolutions. One was the application of laser traps and optical tweezers to biomolecules such as the myosin molecular motor by Jim Spudich and Steve Chu (Applied Physics Department) and their colleagues. This opened the field of single molecule biochemistry, and lead them to found and initially lead the Clark Center and Bio-X program, which bridged the medical school and rest of the campus. The other revolution was the invention of DNA microarrays by Pat Brown and colleagues, and their application to study gene expression with Ron Davis and colleagues. This activated the field of functional genomics and systems biology, and lead Ron to found the Stanford Genome Technology Center with its 75 scientists and \$7M budget, and Pat Brown and collaborators to establish the Stanford Functional Genomics Facility and Stanford Microarray Database to store and distribute the technology and hordes of data that derive from such studies.

This decade has seen the application of the new technologies to many fields including microarrays and cancer and microbiology (Brown lab and collaborators), development (Krasnow, Davis and collaborators), and RNA binding proteins (Brown and Herschlag labs), and single molecule studies of RNA catalysis and folding (Herschlag lab and collaborators). It also saw a move of the Department into new and ever more complex areas of biochemistry and biology, including centromere/kinetochore assembly and chromosome segregation (Straight lab), the biophysics of cell movement and cell shape (Theriot lab), and the program of lung development (Krasnow lab). This pull of the Department into these challenging new areas far from classical biochemistry concerned Arthur, and several in the Department have also been concerned of the longer term consequences of students losing sight and interest in these classical approaches at a time when those approaches and level of analysis would soon become paramount again.

That time appears to be now. Genome-Wide Association Studies (GWAS) throughout the country and world in the past two years have initiated a revolution in human disease gene mapping. Over 250 new disease susceptibility genes have been identified. Studies to date have identified only a small portion (typically 5-10%) of the genes involved in the specific diseases studied, with many of the others likely to come in the near future by larger and more detailed studies including full genome sequencing, and many more to come from diseases not yet studied in this way.

Some of the identified genes were previously implicated in the disease. However, most of the identified genes were not previously implicated. Some immediately suggest new hypotheses for disease pathogenesis and targets, but in many cases the identified genes have no known function. How are we going to set out understanding disease gene products that have no known function? That will involve a Back to the Future return to basics including classical enzymology to understand and characterize their biochemical functions and cellular and physiological functions. This revolution in human disease gene

mapping will break down the final barriers between the basic and clinical sciences, just as recombinant DNA revolution broke down the barriers within the basic sciences during the past three decades. Basic scientists and clinicians will depend on each other during the next decades like never before.

The newly identified genes will provide new insights into the pathogenesis of human disease and new ways to diagnose and classify diseases and identify individuals at risk. They also provide new targets for drug therapies to treat the disease. These new targets come at a critical time for the pharmaceutical industry because despite the huge increasing investment in drug discovery, which exceeded \$25B in 2002, there has paradoxically been a continuously decreasing number of new molecular entities approved (excluding the "me-too" drugs, minor modifications of existing drugs): less than 20 in 2002. Drug company chemical libraries are composed of hundreds of thousands of compounds, which depending on the assay can take days, weeks, or even years to screen to identify a compound of interest. But these libraries typically don't have enough diversity for the discovery of compounds with the target affinity and specificity necessary for an effective drug.

What is needed is a library many orders of magnitude bigger and more chemically diverse than existing libraries, any many orders of magnitude faster ways to find the rare compound with the desired properties. Pehr Harbury and colleagues have come up with an ingenious way to do so, one that can be carried out by individual labs and scientists. It is based on the "DNA display" technology they described in 2004 in which chemical compounds are synthesized on DNA molecules that carry the information for the synthesis of the linked compound. This enables a rare molecule selected from the library to be amplified for chemical characterization or for additional rounds of selection.

Their current library has 2×10 billion compounds, five orders of magnitude larger than pharmaceutical libraries. This library can be rapidly screened for molecules that bind a particular target protein, or even a particular variant of the target, an important step towards personalized medicine. This technology is poised to transform the pharmaceutical industry, and could be the dominant technology of the next decade. Another important technology is being developed by our newest faculty member, Rhiju Das, and colleagues. They are using high throughput analytical approaches combined with computation to discover how sequence encodes the 3D structure of proteins, RNAs, and heteropolymers; such high throughput approaches may someday reveal the 3D structure of all RNAs and proteins encoded by the human genome.

A special aspect of our Department and important factor in our Department's success is the sharing of space, equipment, reagents, and especially ideas and technologies. Lab space is shared equally among all labs, and trainees are interspersed in lab rooms, facilitating social and scientific interactions and providing great opportunities for collaboration and synergy. Interactions are also encouraged through our annual retreat at which all faculty and trainees present their research to the rest of the Department, a bimonthly journal club with a student and faculty presenter, a regular seminar series of outside speakers, and a weekly meeting of the faculty to share recent research results and ideas. There is also a dominant spirit of sharing beyond the Department, such as the unfettered sharing of methods including recombinant methods and microarray

technologies, and the establishment of the Public Library of Science journals by Pat Brown with Mike Eisen and Harold Varmus to facilitate rapid sharing of discoveries and data.

Teaching and training is a major interest and effort of the Department. We teach several required core classes for both first year medical students and first and second year graduate students, and many more specialized elective classes and some classes for undergraduates. There are many outstanding teachers including Kaiser Teaching Award winners Paul Berg, Gil Chu, Dale Kaiser, and Julie Theriot.

Three innovations for this year are: (i) a plan to incorporate a teaching lab including personal genotyping of first year medical students to help prepare for the upcoming revolution in personal genomics; (ii) a Biochemistry Consulting Service (like the Apple store "genius bar") in which students are presented with requests for advice from Stanford faculty and students encountering experimental and analytical problems in their research, and then work with biochemistry faculty to propose solutions; (iii) a week long "boot camp" for incoming graduate students to teach them methods in biochemistry, cell biology, and mathematics. Our most important teaching is the in-lab teaching of graduate students and postdoctoral fellows. We have been fortunate to have attracted an outstanding group of students and postdocs over the past fifty years, and are extremely proud of the success they have achieved in the Department and in their illustrious careers beyond. Many returned last fall to celebrate our 50th Anniversary Symposium, chaired by Suzanne Pfeffer and capped by a dinner at Frost Amphitheater attended by nearly 500, with entertainment by Jim Ferrell's band.

We are committed to increasing diversity in our Department and beyond. This year, under the leadership of Suzanne Pfeffer, we established the Stanford Biochemistry Founders' Award for Doctoral Excellence. The annual Award recognizes outstanding achievement by doctoral scholars as part of our commitment to advancing gender diversity in biochemistry and molecular biosciences. The annual Award also honors the contributions of our Department's founders. The four recipients (Jan Pawlicki, Shana Topp, Brooke Rosenzweig, and Lani Keller) were selected from a nationwide solicitation on the basis of quality, originality, and significance of their work, and hosted here for a symposium and celebration on May 22, where we got to know them and introduced them to our Department and Stanford. We plan to mentor them and hopefully recruit some to Stanford later in their careers.

Update on the Palo Alto VA

At a recent Executive Committee meeting, Dr. Larry Leung, Maureen Lyles D'Ambrogio Professor and Chief of Staff at the Palo Alto Veteran's Administration Hospital, provided the following brief update that I hope will be of interest to you.

Last year, the VA Palo Alto Health Care System (VAPAHCS) cared for more than 55,000 veterans -- from ages 19 to 104. Young amputees from Iraq and Afghanistan, Vietnam Veterans and POWs from World War II walked through the health care system's doors and were treated by Stanford affiliated doctors, residents and fellows. Research conducted at VAPAHCS and at Stanford University has helped these men and women in ways that only a few decades ago would have seemed impossible.

In addition to the 300-bed, acute care hospital at Palo Alto, the health care system also has inpatient divisions at Livermore and Menlo Park and six (soon to be seven) community based outpatient clinics from Monterey to Sonora. Only a handful of hospitals in the world provide the level and variety of specialty care that is available to veterans including a Polytrauma Rehabilitation Center, traumatic brain injury program, two residential post traumatic stress disorder (PTSD) programs, a 41-bed spinal cord injury unit, the Western Blind Rehabilitation Center, a national teleradiology center, a War Related Illness and Injury Center and numerous others.

Other facts about VAPAHCS:

- *Approximately 90 UTL/MCL/Research faculty members, most full-time, are based at VAPAHCS with representation from virtually all Stanford clinical departments (except pediatrics). Several hold division chief or significant administrative appointments at Stanford in addition to their VA appointments. Joint recruitments of faculty have included appointments in biostatistics, medicine, neurosurgery, orthopedics, pathology, psychiatry, surgery and urology.*
- *VAPAHCS hosts a robust and diverse research program, which last year received more than \$51 million to support research centers in geriatrics, mental health, health services (treatment effectiveness and clinical decision making), rehabilitation (Bone and Joint Center) and a Cooperative Studies Program Coordinating Center (management of VA multicenter clinical trials).*
- *There are two NIH Director's Pioneer awardees based at VAPAHCS, Dr. Thomas Rando (Neurology), and Dr. David Relman (Medicine), and one Crafoord Award winner, Dr. Eugene Butcher (Pathology).*
- *VAPAHCS shares residency and fellowship training programs with Stanford and funded 140 resident slots last year.*
- *VAPAHCS has more than \$1.4 billion in the pipeline for major construction projects. New buildings on the Palo Alto campus alone include an acute care psychiatric facility (2010), an ambulatory care center (2012), a Polytrauma and blind rehabilitation center (2012) and a basic science research facility (2013).*

VAPAHCS is rated as one of the most complex and best performing VA facilities in the nation and is universally recognized as a flagship hospital for our veterans. Stanford University plays a big part in that and should be proud of its role in providing world-class medical care, research and mental health care to those men and women who deserve nothing less than the best.

2009 McCormick Faculty Awards Accepting Applications

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2009 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women

pursuing the study of medicine, in teaching medicine, and engaging in medical research. Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to Jennifer Scanlin in the Office of Diversity and Leadership at: jscanlin@stanford.edu by 5pm on August 31, 2009. Further information can be obtained at: http://med.stanford.edu/diversity/faculty/09mccormickcall_apps.html

Skills Building Workshops

Thursday, June 18, 2009

5:30 – 7:30 pm

Alway Building M112

The Office of Diversity and Leadership and the Office of Academic Affairs is pleased to offer a workshop on the “Reappointment and Promotion Process in the Clinician Educator Line.” The workshop will be offered on Thursday, June 18th, 2009, from 5:30 to 7:00pm in the Alway Building, M-112 <http://campus-map.stanford.edu/index.cfm?ID=07-307>. This workshop will present information and discussion about the reappointment and promotion review process. Topics to be covered include: Clinician Educator reappointment and promotion criteria, the A & P Process, the candidate’s evidentiary contributions to the recommendation file and the Clinician Educator professional development leave program. This workshop will be interactive, with panelists responding to questions from participating faculty. Attendance is limited to the first 60 individuals to register.

If you are able to attend, please register for this workshop at this link: <http://reggie.stanford.edu/signup.asp?2290>. For upcoming workshops please visit our website at <http://med.stanford.edu/diversity/>

Awards and Honors

- ***Dr. Stanley Falkow***, the Robert W. and Vivian K. Cahill Professor, added another honor to his long list of accomplishments on May 22nd when he was awarded an honorary degree from the University of British Columbia, Vancouver, Canada. Congratulations to Dr. Falkow!
- ***The Stanford School of Medicine’s Office of Communications & Public Affairs*** has won five medals in the national competition sponsored by the Council for the Advancement and Support of Education (CASE). These included a gold medal for the Office’s for the offices news releases along with four silver medals. This is a great tribute to the leadership of Paul Costello, Director and the excellent staff who comprise the Office of Communications and Public Affairs.
- ***Dr. Shreyas Vasanawala***, Assistant Professor of Radiology and Co-Director of Pediatric MRI at Lucile Parkard Children’s Hospital, and his collaborators, were

awarded the Caffey Award for Outstanding Basic Science Research Paper at the annual meeting of the Society for Pediatric Radiology in Carlsbad, California on April 24, 2009. His collaborators included Marcus Alley, PhD; Richard A. Barth, MD; Brian Hargreaves, PhD; John Pauly, PhD; and Michael Lustig, PhD.

- ***Dr. Thomas Krummel***, Emile Holman Professor and Chair of the Department of Surgery, Susan B. Ford Surgeon-in-Chief at LPCH, and Professor, by courtesy, of Cardiothoracic Surgery, has received the "Outstanding Achievement in Medicine Award" from the Santa Clara County Medical Association at an awards ceremony held on June 2nd at the Fairmont Hotel in San Jose, CA. This award is given to a physician member of the Association who, during his/her medical career, has made unique contributions to the betterment of patient care, for which he/she has achieved widespread recognition.

Congratulations to all!

Commencement and Awards Issue

Commencement 2008

On June 13th the School of Medicine held its Commencement Celebration, recognizing the accomplishments and successes of the 213 recipients of the Masters of Science (30 degrees conferred), Doctor of Philosophy (103 degrees conferred) and Doctor of Medicine (80 degrees conferred). Each of the recipients has worked long and hard for this day and we congratulate each one for their individual or joint degree(s). We also wish each one incredible success in the future and hope that their lives and careers bring them further personal and professional satisfaction.

We commemorated our Commencement Celebration by remarks from two students: Amy Radermacher, who received a PhD in the Immunology Program and Adeoti Oshinowo, who received a Doctor of Medicine degree. Their commencement remarks follow. I offer my thanks and congratulations to Dr. Radermacher, who will be leaving Stanford to join the McKinsey & Company in Minneapolis, Minnesota and to Dr. Oshinowo who soon begins her residency in Obstetrics & Gynecology at the University of Michigan. I have listed all of our stellar graduates below and congratulate each of them and their families and friends.

This year we had the privilege of benefiting from the Commencement Presentation by Dr. Helene Gayle, president and CEO of CARE USA, a leading humanitarian organization fighting global poverty. Dr. Gayle has been internationally recognized for her expertise on health, global development and humanitarian issues. After twenty years at the Centers

for Disease Control (CDC), where she focused on combating HIV/AIDS, Dr. Gayle joined the Bill and Melinda Gates Foundation to lead global programs on HIV, TB and Reproductive Health. At CARE she leads one of the world's premier international humanitarian organizations. Her accomplishments have won her many awards and accolades including being named as one of Newsweek's top 10 "Women in Leadership" in 2008 and one of the Wall Street Journal's "50 Women to Watch" in 2006.

We also had the opportunity to offer our appreciation and gratitude to faculty and students who received awards for teaching, advising and patient care. Their awards and names are listed below.

Graduate Student Speaker: Amy Radermacher, PhD candidate in Immunology

Colin Powel once said, "There are no secrets to success. It is the result of preparation, hard work, and learning from failure." As we have all discovered, graduate school is a long and arduous process with a good bit of failure mixed in. This simple fact begs the question of why we were willing to endure five, six, seven, or even more years (and why we've continually put up with the question of "have you graduated yet?"). I suspect that for many of us, our reasons for staying in graduate school are not the same as those we started with. For some, a Ph.D. is a necessary step towards professorship. For others, running a research group in industry also demands a Ph.D. Others used the Ph.D. to figure out where to go from here and gravitated towards becoming science writers, policy makers, consultants, and patent lawyers. For still others, the knowledge gained during the Masters will be invaluable in future endeavors.

In spite of what of it seemed like in lab at midnight when samples ran off the gel or cells refused to cooperate or one of the other countless things that could have gone wrong and inevitably did at one point or another, a Ph.D. is not without its upsides. There's the moment when you walk into your family reunion and are introduced as a doctor for the first time. Unfortunately, this means that you too will have to look at Uncle Jim's neck rash at Christmas. Remember, you worked 6 years for this! Masters graduates, congratulations on your escape!

The lessons we learned over the years made graduate school worth all the hard work. They'll stick with us long after we've graduated. Now, some of these lessons may be more important than others. For example, knowing how comfortable the couch is in the lounge or, in the case of Beckman, the bathroom, may not be very useful in your next job. But learning that a bottle of two-buck chuck really isn't all that bad could come in handy (especially on a postdoc's salary).

In all seriousness, one lesson we must remember is that with a primarily publically funded degree, whether through the National Institutes of Health or the National Science Foundation, comes a responsibility to society. Giving back by using your extensive scientific training to educate the public, even a little, will not only benefit them, but you as well. Maybe you'll choose to give a public talk about your research. Or lead experiments at your local high school. Or write newspaper articles and editorials

targeted at the public. Whatever you decide to do, increased public understanding of science will only positively impact scientific research.

Even in the face of the failure of experiments, the lack of results, and the glacial pace at which things always seemed to move, the tremendous importance of friends became very clear. Without them, we wouldn't have weathered the stress that was, by another name, graduate school. Everyone got a laugh from putting an eppendorf tube filled with dry ice under the new postdoc's chair and watching him jump when it popped. And figuring out how to make ice cream using liquid nitrogen produced some fun times. Throughout everything, we know our friends were what kept us sane.

These memories and relationships will support us throughout our lives, especially as we conquer our next Ph.D.-like challenge. Because there will definitely be a next challenge. If we've learned nothing else, it's that after graduate school, we can survive pretty much anything.

And yet, perhaps, the greatest reward we received in pursuit of such an ambiguous and extremely frustrating goal was a deeper understanding of ourselves. Pay attention. Think about what you have learned. For, if absorbed, these lessons will guide us through life, towards what will satisfy us, what will make us happy, and what we should strive toward, allowing us to create our own definitions of success instead of following another's path. Perhaps you discovered what area of science excites you most. Or what motivates you. Or where you want to go from here.

Take the time to realize what a huge accomplishment you've achieved today and think about what you'll bring with you as you move on to the next stage of your life. What will you take away?

Medical Student Speaker: Adeoti Oshinowo

Welcome friends, family, and colleagues! Before I start I just want to give a quick shout out to my mom and dad who did not know I'd be speaking today. Surprise!

Over the past weeks I have tried to wrap my head around what I would talk about in the 5 minutes given to me, and it finally came to me while I was packing for the big move and sifting through the seemingly endless piles of stuff I have accumulated in my 5 years here at Stanford, I came across a pair of white, bejeweled, 4 inch, platform flip flops! As I often do, I narrated thru my Bluetooth this new find of an old treasure to my brother. AND as long as I live, I will never forget his words of wisdom 'Turn the page, Ade! Turn the page.'

After a brief moment of silence for my once fabulous platforms, I put them in the Goodwill pile and thought about turning yet another page in life and how much has changed since the last page.

The word "Change" has almost become cliché, but So much has changed since we got here 4, 5, 6, 7, 8, 9, 10 years ago:

First of all, WE have changed.

*From taking a history in one hour to taking one in 10 minutes.
From being afraid to touch a standardized patient, to fluidly examining a patient from head to toe.*

Our list of possible diagnoses has increased from one to many.

*From freaking out in Dr. G's office about what scholarly concentration to pick, to
freaking out in Dr. G's office about what residency program to pick.*

From not knowing what we wanted to do with our lives, to defining a clear path for ourselves

And with the advent of shows like ER, Scrubs, Nip/Tuck, House, Grey's Anatomy, and Private Practice, becoming a doctor, though always admirable, has now become chic and "cool."

We get asked the inevitable questions like: Ok, girl, answer me this: have you met any McDreamy's, McSteamy's, or McHotty's?

To which I answer: No... but I've met some McNerdy's, McGeeky's and McNotty's. ALL of which are cute in their own right.

Sorry, where was I, right change:

I've got three words for you: Barack Hussein Obama--won't say too much (because you know I can)... but real quick: It is only recently that I woke up and thought, "Wow! My first lady is a tall... beautiful... woman... dare I say... like me?"

With changes in government doors have been open for innovations in research, healthcare policy, and international relations that were not open before.

BUT, as we turn the page... the more things change the more some things should stay the same; and seeing as tomorrow is Fathers Day, thought I'd quickly share four lessons from the Mama and Papa Oshinowo book of life that have gotten me through medical school thus far and that will definitely get me through residency and the rest of my life.

Lesson #1: You are a reflection of where you came from. In other words: You are representing more than just yourself. Once when I was in Nigeria, a man whom I had never met came to me and said, "The lives of many hang on your shoulders." As we go off to residency, we ARE the offspring of Stanford and should represent Stanford excellence in everything we do. Just like we represent our communities and our families.

Lesson #2: Know where your help (your source) comes from and seek it out. Our lives, believe it or not, are going to become infinitely more hectic, and without support we may get lost in the controlled chaos of residency. Prayer has been and always will be the source that has gotten me through. So if it be in your family, your friends or your faith, seek it and hold on tight.

Lesson #3: What you give, you get ten times over. Therefore, always take time to help those behind you. I think this lesson speaks to the spirit of mentorship. No matter how old or how young, everyone needs a mentor, but mentorship starts with us, starts with you. Even if you feel like you only have one or two words of wisdom, take a moment to drop

that wisdom on the pre-med, med student, junior resident, or junior colleague. A little goes a long way.

Finally, Lesson #4: In the words of my Pops, “100% work and 100% play is the one and only way.” At least when it pertains to work.

Medical school has given us good times: Luaus at Char’s house; Moonlightings (That’s med school prom for those of you who don’t know); SUMMA conferences; Wilderness bonding, SWEAT trips, ski trips, road trips, spontaneous trips to Vegas, Carnival cruises, Halloween parties, Xmas parties, St. Patty’s day parties, Economic Hardship parties, AND talent shows... SMS 05’s, I hate to admit it, but your production was the funniest to date

All of this in the midst of studying for HHD exams and for boards!

Our ability to take time for ourselves and have fun in the face of daunting tasks, speaks to the spirit of the Stanford Medical Student community, and I, as well as my Pops, believe we should carry this spirit throughout our careers.

That is the end of the lesson, but, Class of 2009, today marks the beginning of a new era, today we turn the page with anticipation of what changes lie ahead, turn the page with confidence that we have been well prepared, and turn the page knowing that we will contribute to the greater good of the world. I am privileged to call you colleagues, and, more importantly, friends; and I can’t wait to see what life has in store for us because I know the book of the Stanford University School of Medicine Class of 2009 will be a real page turner.

Thank you.

Commencement Speaker: Helene Gayle, MD, MPH, President & CEO, CARE USA

Dean Pizzo, distinguished faculty of Stanford Med, family, friends, guests, thank you for inviting me to share this day with the graduating class of 2009.

When Dean Pizzo invited me to be here, I asked what I should speak about. At first, he said I could talk about anything I liked. But I wanted to make sure my remarks were relevant, so I pushed for more clarity. “Really, any hints on what I should talk about would be helpful.” At that point he said, “OK, if you really want to know, I’d like you to speak about 10-15 minutes.”

So I’ll be brief for that reason and two others.

The first is that I understand that I am the last speaker standing between you and getting your degree.

The second reason is that the best advice you are going to receive today will not come from me, the person standing in front of you, but it will come as it always has from the people sitting behind you whose wisdom, guidance and sacrifice have helped make this day a reality.

So, before we go any further, let's hear it for your parents, your families, your loved ones...

Seeing you all in your caps and gowns makes me reflect on how much has changed since I was in medical school. At that time, smallpox had recently been eradicated, the first test-tube baby was born and information technology was a handheld calculator.

However, one thing hasn't changed: A degree in medicine and medical sciences is one of the most powerful tools I know to enable you to have a positive impact on individuals, societies and our entire world.

I urge you to realize this power.

You are graduating today into a world of paradoxes.

There are more millionaires and billionaires than ever before, and yet half the world's people have to survive on less than \$2 a day; over a billion people live on less than one dollar a day. One out of every six people in our world has no access to safe drinking water.

Even in our country, the gap between affluence and poverty is growing. During this economic crisis, while so many are struggling, we have heard appalling examples of greed and excessive compensation.

Meanwhile, more than 45 million Americans, including 9 million children, have no health insurance.

In a World Health Organization report a few years back, America was ranked 37th in the world in overall health system effectiveness. Clearly, we have unfinished business in our own health agenda.

Then, consider for a moment the health gap between the developed and the developing world.

The average life expectancy in industrialized nations is 77 years, compared with 49 years in the developing world. Why? Well largely because, children in poor countries die at astonishing rates and from diseases we have essentially eliminated in this country

Today a child born in Africa is 20 times more likely to die before his or her first birthday than a child in America.

More than half of these deaths are due to preventable diseases – malaria, measles and diarrhea. And, while we fight obesity and diseases of over nutrition, the other half of those preventable childhood deaths are due to lack of food and malnutrition.

Then there are diseases like HIV and tuberculosis that account for 5 million deaths each year, mainly in adults, most of whom were in the prime years of their lives. And, finally, chronic diseases in poor nations are on the rise, adding to the already daunting challenge of infectious disease.

Yet, at the same time that we seem more distant and divided than ever before, we are also closer and more connected than ever. Swine flu and other diseases remind us that

microbes don't stop at borders. And technology allows us to bridge vast distances in a blink of an eye.

So, the art and science of building healthy societies has always been essential, but it seems especially crucial now.

We've seen advances in genetics and biotechnology that were incomprehensible 50 years ago, and almost unimaginable even a decade ago. At home and around the world, we've made it possible to live longer, better lives. However, the application of progress has fallen far behind the pace of change.

Our science may be superb and our medicines more effective than ever, but still, our ability to get care and treatment to the people who need it most in this country and around the world is deeply unimpressive.

If we believe that all life has equal value, then a preventable death anywhere in the world is a tragedy and should cause us some measure of pain.

Consider this: when the Air France flight from Brazil crashed last week, we heard immediately about the heartbreaking loss of the 228 people aboard -- and we mourned for them, their families and friends. Yet on that very same day, 8,000 children died from diseases that inexpensive vaccines could have prevented, 14,000 people were newly infected with HIV and 1,500 women died from childbirth.

Pennies a day could make the difference between life and death for millions of people. If we put our best minds and resources towards solving the problems that impact the greatest number of people in our world, we could dramatically change those statistics in our lifetime.

This strikes me as much more than a health problem. It raises profoundly important moral questions. What do we all stand for? What do we value for all human life? How should we use our careers as health professionals?

All of our finest philosophers have told us in simple language that we have an obligation to take care of each other. In the words of Martin Luther King: "We are caught in an inescapable network of mutuality, tied in a single garment of destiny. Whatever affects one directly, affects another indirectly." Or as the English poet and clergyman John Donne wrote, "Anyone's death diminishes me, because I am involved in mankind."

So what can we do about it?

Each of you will surely find a different way to find your highest calling and to impact the lives of people who are, after all, depending on you to make a difference.

As you sit here, thinking forward of the careers you are about to undertake, I feel the opposite impulse -- to reflect backwards, on what I was thinking when I was in your shoes, about to start my new career.

When I was growing up, I never thought much about being a doctor. In high school, I considered myself to be, first and foremost, a social activist. Nixon. Racism. Sexism. Apartheid. Bras. You name it, I protested it.

It wasn't until half way through college that I began to see how a career in health could be an amazing path for contributing to social change... and that social change was better achieved by being for something, rather than against everything.

My growing interest in public health was solidified in medical school when I heard a commencement speech at my brother's graduation ceremony by Dr. D.A. Henderson, one of the leaders of the worldwide campaign to eradicate smallpox.

I was simply awed by the audacity of the effort he described.

Using the tools of public health, he and people like him around the world took on smallpox -- a disease that is estimated to have taken over 500 million lives since the time of the Pharaohs -- and wiped it from the face of the earth.

I realized right then that I would use my career to impact social change and social justice by working to improve the health of people around the world.

After graduating, I trained in pediatrics and public health, and went to work at the Centers for Disease Control.

It didn't take long before I chose to work on HIV/AIDS or as I often say, HIV chose me, not only because it was a scientifically fascinating issue but equally because of the societal imperative that it poses.

Making a difference in the fight against HIV, a disease that disproportionately affects the poor, the socially marginalized and stigmatized, means affirming that all life matters and has equal value—whether it is the life of a injecting drug user in urban America, a young gay man in London or a teenage sex worker in northern Thailand.

That same commitment to use my skills to contribute to social justice eventually led me to work at the Bill and Melinda Gates Foundation and then to CARE.

It is deeply gratifying to be part of an organization that is tackling poor health in the context of fighting poverty and its root causes. With no access to clean and safe drinking water, when a child gets sick from dirty water, whether or not she gets medicine doesn't matter. The next time she fills her glass, she'll just get sick again.

This is how the cycle of poverty drags people down: one illness, one injury, one drink of water at a time.

For want of the most basic things, families lose their footing. The official cause of death might be diarrhea or malaria or cholera; but the real killer is poverty.

It is a great privilege to work for organizations that believe we can make a difference in the lives of people everywhere. And to support communities who are coming together to improve their health and quality of life -- in places like Peru where rural women are trained as skilled birth attendants, in Angola where families help build and maintain clean water systems or in Bangladesh where improved management of dairy production is increasing incomes and nutrition.

But believe me, I am leaving plenty for you new graduates to do.

I talked earlier about the gaps in society... the advances in medicine and the incredible pace of change.

It will fall to you to combine your education... your commitment... and those advances to bridge the gaps and write a more hopeful chapter in the story of our national health... and global health.

This is a time of incredible challenge, but great challenges also bring great opportunities. When you return for your reunion 10, 20, 50 years from now, what do you want to be said about what you did with your career? How do you want your generation to be remembered?

Only you can answer those questions for yourselves... all I can offer is my hope, my prayers, my pride... and one final story:

I think one of the most remarkable people that I have ever had the privilege of meeting is Nelson Mandela.

In his inaugural address as the first democratically elected president of South Africa, he challenged all of us to acknowledge the potential we all have within but are often afraid to realize. He said, "Our deepest fear is not that we are inadequate. Our deepest fear is that we are powerful beyond measure."

As Nelson Mandela was waiting for his moment, during those long years of incarceration, he never lost his faith that he could help change the world. That same spirit was found in the townships of Soweto in South Africa, among the poor women who struggled against so many forms of adversity, but sang a song over and over with this verse: "We're the ones we've been waiting for," reminding themselves that they too had an important role to play in the future of their society.

Those two thoughts contain everything I want to say to you today.

The challenges the world presents to you are great, but so are the tools and talents you possess. You are powerful beyond measure.

This is the moment you've been waiting for. And as the world waits for people of talent and vision to bridge the yawning chasm between what appears inconceivable and what we hope to make inevitable, realize this: You are the ones you've been waiting for.

Congratulations and thank you, Stanford med class of 2009!

###

University Commencement Award Winners from the School of Medicine

The Walter J. Gores Faculty Achievement Award "in recognition of excellence in teaching in its broadest sense"

Sudeb Chandra Dalai , Stanford Medical Student - 5

The Lloyd W. Dinelspiel Award for Outstanding Service to Undergraduate Education at Stanford University

Judith T. Ned, Executive Director, Stanford Medical Youth Science Program

Faculty and Student Awards for Teaching, Mentoring and Patient Care

I am pleased to acknowledge and thank our faculty and students who have been chosen by their peers and our students because of their dedication to teaching, mentoring and advising, and excellence in patient care. Congratulations to all.

The Lawrence H. Mathers Award for Exceptional Commitment to Teaching and Active Involvement in Medical Student Education:

Andy Connolly, Associate Professor of Pathology

The Henry J. Kaiser Family Foundation Award for Excellence in Preclinical Teaching:

Pree Basaviah, Clinical Associate Professor, General Internal Medicine

Marty Bronk, Adjunct Clinical Associate Professor, General Surgery

Neil Gesundheit, Associate Professor (Teaching) of Medicine

The Henry J. Kaiser Family Foundation Award for Excellence in Clinical Teaching:

James Baxter, Clinical Associated Professor (Affiliated)

Peter Pompei, Associate Professor of Medicine, General Internal Medicine

Lars Osterberg, Clinical Associate Professor

The Arthur L. Bloomfield Award in Recognition of Excellence in the Teaching of Clinical Medicine:

Douglas Fredrick, Clinical Professor in Ophthalmology

Abraham Verghese, Professor of Medicine, Senior Associate Chair

Drew Nevins, Clinical Assistant Professor, Infectious Diseases

The Henry J. Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education:

Kay Daniels, Clinical Associate Professor, Obstetrics and Gynecology

Steve Lipman, Clinical Assistant Professor, Anesthesia

The Franklin G. Ebaugh, Jr. Award for Advising Medical Students:

Maurice Druzin, Professor-Med Center Line, Obstetrics & Gynecology

The Alwin C. Rambar-James B.D. Mark Award for Excellence in Patient Care

David K. Stevenson, M.D. Vice Dean and Senior Associate Dean for Academic Affairs, the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology

Award for Outstanding Graduate Student Teaching (Faculty):

Tim Stearns, Professor of Biology and Genetics

Award for Outstanding Teaching Assistant (Student):

Sara Brownell, Department of Biology

Dina Finan, Department of Biochemistry

Award for Outstanding Service to Graduate Students (Faculty):

W. James Nelson, Rudy J. and Daphne Donohue Munzer Professor in the School of Medicine and Professor of Molecular and Cellular Physiology

Award for Outstanding Service to Graduate Students (Student):

Amy Palin, Department of Immunology

Award for Outstanding Contributions toward Advancing Diversity (Student):

Matthew Zack Anderson, PhD candidate in Genetics

Senior Associate Dean's Special Award for Exceptional Leadership:

Jessica Allen, Department of Immunology

Amy Radermacher, Department of Immunology

SUPD Award for Outstanding Postdoc Mentoring:

Michaela Kiernan, Senior Resident Scientist

Kang Shen, Assistant Professor of Biology

The Graduates of 2009

Following are the students who received Master, PhD and MD degrees in 2009. A number of these graduates are dual degree recipients. Again, congratulations to all.

Other Awards and Honors

Ronald G. Pearl, MD, PhD, the chair of the Department of Anesthesia and associate medical director of the intensive care units at Stanford Hospital & Clinics, was named the first incumbent of the Richard K. and Erika N. Richards Professorship at an investiture ceremony on June 9th. Congratulations to Dr. Pearl.

Dean's Newsletter July 6, 2009

Another Cycle Begins – But This One Has National Significance

July 1st marks the beginning of another cycle in the life of academic medical centers. Newly minted MDs, most having graduated from medical school in the last month, begin their official responsibilities as Residents in hospitals across the nation on July 1st – generally after a week or more of “orientation.” In addition, graduates of residency programs begin clinical fellowship programs in medical, surgical and hospital based specialties and subspecialties. In particular I would like to welcome our new Residents and Fellows to Stanford and wish them the best of future success. They are entering training in graduate or post-graduate medical education at a time of great excitement and opportunity – as well as turmoil and uncertainty – in American medicine. And, for the first time in many years, academic leaders, physician colleagues and politicians are questioning the choices Residents and Fellows have made in pursuing careers in primary care vs subspecialty medicine. In fact concerns about the national shortage of primary care physicians (now less than 50% of the US doctor workforce) have become front and center in the healthcare reform debate.

As I noted in my March 30th Dean's Newsletter (see: http://deansnewsletter.stanford.edu/archive/03_30_09.html#7) the majority of 2009 graduating Stanford students, like others around the country, chose specialty track residency programs. In fact, on a national basis, the most “competitive” and sought after residencies include dermatology, neurological surgery, orthopaedic surgery, and otolaryngology – as well as anesthesia, radiology, and emergency medicine. Fewer students select “primary care” areas (which generally include family medicine, internal medicine, pediatrics and in some areas, obstetrics-gynecology). This has led many to opine on the reasons for these choices, which include factors like the level of medical student debt, projected income differentials between careers in primary care versus specialty care (which over the course of a 35-40 year career can amount to as much as \$3.5 million), the social, geographic background and gender of the graduates as well as “life-style choices,” and the perceived value of “primary care” at teaching hospitals and in the community (where it is often considered a “lost leader”). These and other factors converge to influence choice – which has largely moved away from primary care over the last decades in the US.

A recent report from the Robert Graham Center, with support from the Josiah Macy Jr. Foundation, entitled *Specialty and Geographic Distribution of the Physician Workforce: What*

Influences Medical Student and Resident Choices? (see: <http://tinyurl.com/cq28nv>) affirmed these factors and offered recommendations to address this challenge that included:

- *“Create more opportunities for students and young physicians to trade debt for service, through effective programs such as the National Health Service Corps.*
- *Reduce or resolve disparities in physician income*
- *Admit a greater proportion of students to medical school who are more likely to choose primary care, rural practice, and the care of the underserved.*
- *Study the degree to which educational debt prevents middle class and poor students from applying to medical school and potential policies to reduce such barriers.*
- *Shift substantially more training of medical students and residents to community, rural and underserved settings.*
- *Support primary care departments and residency programs and their roles in teaching and mentoring trainees.*
- *Reauthorize and revitalize funding through Title VII, Section 747 of the Public Health Service Act*
- *Study how to make rural areas more likely practice options, especially for women physicians.*
- *New medical schools should be public with preference for rural communities.”*

A number of these recommendations are sensible and I personally agree with many but not all. I should also add that while I strongly support the importance of a better balance in the physician workforce in the US, I also believe that Stanford’s role remains unique and should stay focused on training and educating future leaders and physician-scientists and scholars. There is also a dearth of these individuals, and we have the resources and expertise to train the academic and research workforce of tomorrow – which is also critically important to the future of healthcare reform.

Back to primary care: two brief and informative articles in the June 25th issue of the New England Journal of Medicine – *A Life Line for Primary Care* and *Easing the Shortage in Adult Primary Care –Is It All about Money?* – offer additional data and perspective to this topic and are worth reading. It is notable that on July 1st, the very day that new Residents officially began their new training, the Centers for Medicare and Medicaid Services (CMS) announced proposed changes to policy and payment rates that begin to address some of the compensation issues mentioned above (see: <http://tinyurl.com/kqsdym>). These policy recommendations, while certain to engender considerable discussion, go to the heart of the matter by recommending a payment structure that will increase payments to internists, family physicians, general practitioners and geriatric specialists by 6-8% in 2010. Given the imperative to reduce the overall costs of health care, these proposed policies reduce payments to certain specialists (e.g., compensation to cardiologists would fall by 11% and radiologists would have reductions in payments for imaging procedures using equipment like CT and MR scans approaching 20%).

How these policies will be actualized remains to be seen, but the directions being taken are not surprising and are quite consistent with what I have heard at numerous recent meetings and discussions in Washington. Some of these ideas were also reflected in my observations in an earlier issue of the DNL (see: http://deansnewsletter.stanford.edu/archive/04_13_09.html#1) and

in a podcast I did with Paul Costello, Director of Communications and Public Affairs (<http://med.stanford.edu/121/2009/pizzo.html>). As these and related changes unfold, it is likely that we will experience impacts at multiple levels and dimensions.

In tandem with the possibility of increasing payments for primary care physicians (and concomitant reductions in compensation for selected specialists and technologies), considerable discussion has taken place recently about the physician workforce *per se* as well as graduate medical education (GME) slots and the payment for GME through Medicare. While a number of groups, including the Association for American Medical Colleges (AAMC) have advocated for significant increases in medical school class size – up to 30% – to meet projected shortages of physicians, I believe (and have previously stated) that this needs be more carefully assessed. Increasing the number of medical school graduates, without also placing limits on career choice or even practice location, will likely only sustain our current system and its consequences.

Of course I am well aware that restricting or limiting choice has been anathema to our current educational paradigm, and I would quickly add that shifts in that paradigm are needed. Indeed, while there may be a need for more physicians in selected areas, it seems much more sensible to look at the healthcare workforce more broadly and to redefine the practice of primary care. This would require the addition of other health professionals – nurses and advanced nurse practitioners/physician assistants – who could and should assume some of the tasks previously done by physicians. Creating new teams of care providers that create complementarity and synergy in the management of patients with acute and chronic disorders is more sensible than simply increasing the number of doctors. At the same time, defining the workforce and its responsibilities in the absence of knowing what healthcare will look like in the decade ahead poses significant challenges. That said, these processes will almost certainly need to progress in parallel.

In addition to compensation, debt relief and related workforce issues, the length of education and training of physicians will need to be examined. In doing so, there should be no rush to a “one size fits all” mentality, since the knowledge and skills vary considerably depending on the nature of the medical career being pursued. However, approaching medical education with an eye toward improving efficiency and effectiveness is an imperative – a process which has begun in certain specialties (e.g., cardiac surgery) but which needs much more effort. Importantly, these considerations also underscore the importance of addressing the continuum of medical education – which begins post-high school and extends through residency and fellowship – in a much more interrelated fashion. From the time a student enters college to the point of entering the workplace there is a range of 12-21 years depending on the education pathways chosen. While there is again discussion about reducing the length of medical school from four to three years, equally if not more important considerations should focus on college preparation as well as graduate and postgraduate training. And, as mentioned, these need to be adjusted to the missions and goals of the medical school, university, career path and other important factors that will determine the future of medicine and science.

Change poses challenges, but I always welcome the prospect of using change to improve our missions and goals. The aspects of the healthcare debate that extend to education and training compel us to examine what we can do to improve the effectiveness and efficiency of our

programs across the continuum. The silver lining is that this will permit us to strive to improve and integrate our programs so that Stanford remains a leader in education and training.

Whether (and Weather) National Healthcare Reform

My 23 years in Bethesda at the NIH offered numerous glimpses of the Washington scene. Summers were always hot and humid with intense thunderstorms nearly every afternoon. Indeed the air was usually even more hot and humid after the storm had ended. In some ways the weather of a Washington summer is a metaphor for the intensity of the climate surrounding healthcare reform. To say that the debate is heating up is a gross understatement. This is not surprising, given the magnitude of the economic challenges – unsustainable in their own right – and the number of constituencies (including doctors, hospitals, pharmaceutical companies, and the insurance industry just to name a few) that are also unsustainable in their current focus and formulation. During the past months I have made a significant number of trips to DC to attend meetings at the White House or policy meetings with professional organizations (e.g., Association for Academic Health Centers, Association of American Medical Colleges) who share concerns about healthcare in the US and the prospects for its reform.

Virtually everyone believes that if change comes it will happen before the end of the calendar year and that the peak of the pressure points will take place in the fall when the Congress returns from its summer recess. The stakes are enormous and the convergence (or divergence) of the Executive Branch and the Legislative Branch will speak volumes about our future. It is also important to underscore that, given the political forces that will surge during the 2010 election year, if change fails to take place this year the prospects for serious reform in health care will be squandered for the immediate future. In reality, however, the situation will only grow worse, since failure to seriously curtail ever-rising healthcare expenditures in the US will only become more challenging in the years ahead as the percentage of the GDP devoted to healthcare continues to rise to unsustainable (and unjustifiable) levels.

The other thing that virtually every constituency group seems to believe, at some level, is that their own interests will not be affected – that they have somehow struck a deal with the Congress, the White House or each other. I realize that my own views are likely less informed, but from what I can see it is unlikely that any perceived deal or conclusion is sacrosanct at this point. In fact, the only thing that seems to have broad concurrence is that cost containment is critical (although there is debate about whether this would mean achieving true reductions or changing the rate or slope of the increases).

I won't reiterate the various issues, factors and forces shaping the health care debate since I covered those in a past DNL (see: http://deansnewsletter.stanford.edu/archive/04_13_09.html#1) and podcast (<http://med.stanford.edu/121/2009/pizzo.html>). But I would recommend a couple of articles that will amplify the points of debate. One is Dr. Atul Gawande's now famous piece entitled *The Cost Conundrum* that appeared in the June 1st issue of the *New Yorker* (see: http://www.newyorker.com/reporting/2009/06/01/090601fa_fact_gawande). Gawande explores the reasons why healthcare expenditures are highest in the nation in the town of McAllen Texas and, in his insightful writing style, points out that the costs of care are not associated with improved outcomes. In fact, as has been reported over the years from the Dartmouth group, an

inverse correlation between Medicare expenditures and outcomes has been observed in a number of regions of the US.

The Dartmouth Atlas Project (see: http://healthcarereform.nejm.org/?page_id=597) displays Medicare reimbursements per enrollee by hospital referral region or by state. If you review the interactive map (also made available by the NEJM) the differences in Medicare reimbursements are quite striking. In places like McAllen Texas, where they rose dramatically during a fourteen-year period (1992-2006), they can reflect physician practice and use of technology and procedures in a remarkable fashion – which is not necessarily associated with better outcomes. Understanding these associations is important and, while a number of caveats can be offered, it cannot be denied that costs around the country (or even in geographically proximate areas) vary widely and are almost certainly influenced by physician practice. Indeed, while the overall percentage of health care dollars attributable to doctors is only around 10% (although it must be noted US physicians are among the highest paid in the world) the reality is that physicians account for the determination of a very high proportion of health costs. These issues are now among the centerpieces of the healthcare debate.

As I noted above, whether there is significant healthcare reform in 2009 depends on many factors. A bell-weather at this juncture is the burgeoning debate over a public alternative to private insurance. There are many points of view about this, including the assertion that private insurance should not be negatively impacted since it is critical to controlling choice, access and costs. To me this is a bogus argument since the market- driven health insurance industry has played a significant role in generating the problems we now experience. This issue is well reviewed by Dr. Arnold Relman (former Editor of the New England Journal of Medicine) in the July 2nd New York Review of Books in an article entitled *The Health Reform We Need & Are Not Getting* (see: <http://www.nybooks.com/articles/22798>). While this review will engender various reactions, it further underscores the point that the argument that the market place is the best way to reform healthcare simply doesn't ring true. Certainly the last four decades in the US speak to that – as do the seminal studies of Kenneth Arrow (for which he won the Nobel Prize) that showed that healthcare is not a commodity to which general economic principles can be applied.

In the end, the thunder and lighting in Washington this summer and fall will determine whether we see progress in healthcare reform. I still believe that in the long run we will be best served by a single payer system coupled with private options, not too dissimilar from that in the UK. In the interim, reform that includes a public option to private insurance, controls costs for drugs and technology, rebalances the healthcare workforce between primary and specialty care as well as creating teams of physician and other professional providers, and creates a focus on quality and safety and an orientation toward health as well as disease management would be among the necessary components. In tandem with this is the hope that healthcare reform will permit doctors to reclaim their place as professionals who serve the welfare of patients and communities and not just as members of the industrial medical complex that is now so dysfunctional and unsustainable.

Dr. Keith Humphreys Takes Leave to Serve in Washington

Dr. Keith Humphreys, Professor of Psychiatry and Behavioral Sciences, will be taking a leave of absence to serve as the Senior Policy Advisor, White House Office of National Drug Control Policy. Please join me in congratulating Dr. Humphreys and wishing him success in his new role – and of course, anticipating his return to Stanford in the not too distant future.

Upcoming Event

Skills Building Workshop

The Office of Diversity and Leadership is pleased to offer a workshop on “Conflict Resolution”, presented by Odette Pollar. The workshop will be offered on **Thursday, July 16th, 2009, from 5:30 to 7:30pm in Alway Building, M-112** <http://campus-map.stanford.edu/index.cfm?ID=07-307>. This workshop is offered to all interested faculty.

This will be a hands-on intensive workshop which will help you identify the real problem, diagnose potential conflict, and effectively resolve conflicts in the making. These techniques will have application to the participants’ personal and professional lives. This program will cover Conflict Awareness, Conflict Management and Conflict Resolution. If you are able to attend, please register for this workshop at this link: <http://reggie.stanford.edu/signup.asp?2290>

2009 McCormick Faculty Awards

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2009 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research. Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to [Jennifer Scanlin](#) in the Office of Diversity and Leadership by 5pm on August 31, 2009. Further information can be obtained at: http://med.stanford.edu/diversity/faculty/09mccormickcall_apps.html

Awards and Honors

- **Dr Sherry Wren**, Professor of Surgery, has been selected as the Loyola University Chicago Stritch School of Medicine Alum of the Year for her contributions to medical education. This is a great and well-deserved honor. She will receive her award in September in Chicago.
- **Richard Gaster, fourth year MD/PhD student, and Drew Hall, a fourth year student in Electrical Engineering**, won the inaugural Institute of Electrical and Electronics Engineers first prize in the “Change the World Competition.” The Stanford team also won first prize in the National Collegiate Inventors and Innovators Alliance Biomedical Engineering Idea competition for inventing the “lab-on-a-stick.” Congratulations to Richard and Drew.
- **Jacqueline Baras Shreibati**, Medical student and Health Service Research Masters Graduate, has just won the Student Poster Award at the Academy Health annual meeting in Chicago, and was also selected as one of the four best abstracts submitted by students to be featured in a special panel of top student projects. Contratulations, Jacqueline.

Appointments and Promotions

R. Kim Butts-Pauly, has been promoted to Professor (Research) of Radiology, effective 7/01/09.

Mary Ann Carmack has been promoted to Adjunct Clinical Assistant Professor of Pediatrics effective 7/01/09

Dwight Chen has been promoted to Adjunct Clinical Assistant Professor of Obstetrics and Gynecology effective 9/01/09

Stevens Y. Kim has been promoted to Adjunct Clinical Assistant Professor of Ophthalmology effective 4/01/09

Amy Oro has been promoted to Adjunct Clinical Assistant Professor of Pediatrics effective 5/01/09

Gary Peltz has been appointed to Professor of Anesthesia, effective 7/01/09.

Thomas Plante has been promoted to Adjunct Clinical Professor of Psychiatry and Behavioral Sciences effective 9/01/09

Peter Schubart has been promoted to Adjunct Clinical Associate Professor of Surgery effective 5/01/09

Dean's Newsletter July 27, 2009

Evolving Criteria for Clinician-Scholar/Clinician Investigator Faculty

In 2003 two major events helped shape the faculty tracks that comprise the School of Medicine professoriate today. The first was the redefinition of the faculty tracks to better align them with the diverse roles that physicians and scientists play in academic medicine. This occurred prior to and following our first Strategic Planning Leadership Retreat, which was held in January 2002. At that time, a Work Group led by Dr. David Stevenson, Vice Dean and Senior Associate Dean for Academic Affairs, redefined the academic professoriate to include Investigators (aka "University Tenure Line" or UTL), Clinician-Scholars/Clinician-Investigators (aka "Medical Center Line" or MCL) and Clinician-Educators (previously known as "Staff Physicians"). An important component of this redefinition was the approval by the University Academic Senate of a policy revision that allowed Clinician-Scholars/Clinician-Investigators (or MCL faculty) to serve as Principal Investigators (PIs) on grants and contracts (see also: http://deansnewsletter.stanford.edu/archive/10_13_03.html). This change was important in elevating the perceived value of the MCL faculty within the Stanford community. The second

major event in 2003 was the establishment of a “faculty cap” by the Provost that set the upper limit of full-time faculty at 900 (exclusive of Clinician-Educators).

Both of these changes continue to evolve and impact our professoriate. While the changes made in the Clinician-Scholar/Clinician-Investigator line have been helpful, they have not been uniformly adopted throughout our clinical departments. In addition, they did not pay sufficient attention to formal evaluation of clinical performance or to the opportunities for scholarship that MCL faculty should anticipate, given that scholarship is expected and evaluated as part of their academic performance. Accordingly, at the Executive Committee meeting on July 17th, Dr. Stevenson presented further changes in the “Criteria and Guidelines for Appointment, Reappointment and Promotion in the Medical Center Line (MCL)” that will soon be available for review in the Faculty Handbook. I want to give you a preview of what is forthcoming since it has a number of implications – which I view as important, relevant and favorable to our faculty and the evaluation process. These changes also emanate from antecedent issues and decisions – a topic I covered in the summary of my introductory comments at the 2009 Strategic Planning Leadership Retreat entitled “Creating a Culture that Fosters Faculty Development and Success” (see: http://deansnewsletter.stanford.edu/archive/02_17_09.html#2).

The overarching goals of the planned changes are to help Clinician-Scholar/Clinician-Investigator (MCL) faculty achieve and be recognized in the context of each individual’s balance of scholarship, teaching and patient care activities. This includes assuring that faculty have protected time for scholarship and that they have a sufficient overall amount of time to define, delineate and demonstrate their proficiency as excellent academicians as well as excellent physicians.

A pervasive view among our clinical faculty is that the demands of clinical care activities do not leave sufficient time for scholarship and that this time is not necessarily protected and sometimes not even acknowledged by the home department. Second, it is recognized that the vast majority of Clinician-Scholars/Clinician-Investigators will be involved in clinical and translational research, frequently as part of a team, and that this type of research may require a longer time to reach fruition than individually directed basic science projects. Thus, protecting time for academic development each year and, in addition, having a sufficient number of years to achieve meaningful results before coming up for reappointment or promotion are important issues.

There is also a strong desire on the School’s part to do what is possible to foster work-family balance and to recognize the needs, demands and expectations that affect faculty on the basis of their area of medical specialty and expertise as well as the course each has charted for personal and professional development. We also appreciate that the proportion of contributions to the missions of patient care, education and research will vary by individual and also over the span of any single faculty member’s career. At the same time it must be recognized that patient care will almost always be the most important part of the Clinician-Scholars/Clinician-Investigator role and, while the proportional balance of this can change over time, clinical proficiency, quality, service and excellence should always be at the highest possible level. With that in mind, evaluating performance as an outstanding patient care provider has not been assessed as carefully and fully as should be the case – and this requires remediation.

Based on these observations and guiding principles, the following was discussed with the Executive Committee on July 17th.

1. Effective September 1, 2009, all Medical Center Line faculty will be expected to have at least 20% of their time reserved for academic scholarship and development.
2. Also effective September 1, 2009, the total number of years of initial appointment and reappointment in the Medical Center Line, which is now normally seven, will be ten. (*A plan is being developed to "grandfather" MCL assistant professors who are currently on a seven-year clock.*)
3. The initial appointment term will be four years for Medical Center Line faculty. (*A plan will also be developed to provide assistant professors in the University Tenure Line with an initial term of four years, followed by a reappointment of three years [as opposed to the current schedule of three years plus four years].*)
4. At the beginning of the fourth year in rank, the department will initiate the reappointment review. After evidence has been compiled for the long form, the department will consider the faculty member's career trajectory and whether there is a realistic chance for promotion in the future on the basis of continuation of the candidate's work.
5. If the outcome is positive, the assistant professor will be reappointed for six years. (If the outcome is negative, the assistant professor may be eligible to receive a terminal year.)
6. During the seventh year in rank, the department chair (or designate) will prepare a written counseling memo, which will evaluate and document the assistant professor's performance in light of the criteria for promotion.
7. Initiation of the promotion review will commence at the beginning of the tenth year.
8. Under certain circumstances, MCL faculty who have made accelerated progress in clinical care, teaching and scholarship (or who have had prior years of faculty experience at their current rank) may be proposed for early promotion. Since, in many cases, the School and University are being asked to evaluate a person who may have a shorter track record, there should be *unequivocal* evidence that the quality of the faculty member's contributions meets the criteria for promotion to the higher rank. Early promotions will typically commence in one of the years following reappointment. In rare cases, however, promotion may be considered in lieu of reappointment (that is, at the beginning of the fourth year of appointment). There should be mutual agreement between the department chair (or designate) and the faculty member regarding the possibility of early promotion.

Consultation between the department and the Senior Associate Dean for Academic Affairs is essential prior to initiating a review process leading toward early promotion (with the Senior Associate Dean making the final decision). Unsuccessful candidates may be proposed again at the normal time if that remains desirable to the candidate and the department. However, in order to avoid potential awkwardness following a negative promotion decision, it is prudent to initiate an early promotion review only when a positive outcome can be anticipated with reasonable confidence.

9. MCL assistant professors will be ineligible for any extensions to their appointment that would take the total appointment time beyond ten years in rank. (If the outcome of the promotion review is negative, the assistant professor may be eligible to receive a terminal year.)

10. Annual counseling will continue to be required to monitor progress toward reappointment, as well as the subsequent promotion review. Serious concerns regarding the faculty member's progress that could impede reappointment or promotion will need to be discussed with the Senior Associate Dean for Academic Affairs as soon as they emerge.

In addition to these changes, a new tool and methodology has been delineated to assess “Clinical Excellence Core Competencies” for MCL being considered for appointment (if the candidate is already at Stanford), reappointment or promotion. This new evaluation tool is based on input from referees from within Stanford, clinical trainees, health care providers who consult with or who refer patients to the candidate, nurse managers, clinic managers or senior clinical administrators and physician colleagues. Evaluators will be asked to score faculty on a five-point scale (and to comment where appropriate) on general clinical proficiency, communication skills, professionalism, systems-based practice and “overall clinical performance.” These evaluations will serve as an important part of each MCL faculty member’s appointment (if, as noted above, the candidate is already at Stanford), reappointment or promotion and will give value, weight, and importance to clinical performance as an important facet of the MCL faculty member’s Stanford career.

A number of important comments and recommendations were raised at the Executive Committee about these planned changes for MCL faculty that will be discussed and considered as this process moves forward. As with all initiatives, it is best to consider this as a work in progress – but also as an effort designed to improve the ways we evaluate and support our clinical faculty. I am very appreciative of the leadership of Dr. Stevenson and the Office of Academic Affairs as well as the faculty who served on the task forces that developed these new recommendations.

The State, the Nation and Higher Education

Over the past year I have written frequently in this Newsletter about the impact of the economic downturn on the University and the School of Medicine. As we are now just completing the Medical School budget for FY10, the negative effects of the past year’s fiscal crisis on our overall portfolio are glaringly apparent. With major reductions in revenue from the endowment and other sources, we have had to reduce our general operating budget by nearly 15%. As you know from past communications, this is coupled with hiring freezes, layoffs, salary freezes, reduced amenities and other cutbacks. As we move through this process and anticipate future reductions that are likely to emerge from the much-needed healthcare reform, it is imperative that we first and foremost focus on our core missions and what we want to preserve and protect. Despite the many challenges we face I remain optimistic that with wise planning, cooperation and some shared sacrifice we will prevail – and perhaps even be stronger when we emerge in the future.

As difficult as our own challenges may seem, they also need to be placed into context. In recent months we have witnessed the impact of the housing and financial systems debacle on our national economy. Today we also see its impact on the State of California – made worse here by the political turmoil in Sacramento and a legislative and executive system that seems to have lost its directional compass. The \$26B state deficit has resulted in a budget crisis that will have an

extraordinarily negative impact on what has been one of the world's most outstanding public education systems. I had the opportunity to hear some of the details of the planned cutbacks from leaders of both the California State University (CSU) and the University of California (UC) systems at the July 24th Board of Directors meeting of the California Healthcare Institute, on which I serve.

For the CSU system, the current operating deficit is \$580 million on a \$6.2 billion base. The operating budget deficit in general funds is approximately 20%. Similarly, in the UCs, which have an overall budget of approximately \$20 billion, there is a 24% reduction in general funds. Similar to private universities (which have lost significant amounts of endowment income and comparable losses of general fund support), the impacts are very significant. These will include hiring freezes, reduced numbers of faculty recruitments, compulsory furloughs of up to 24 days per year (depending on compensation levels). It will also mean increased student tuition fees and costs, larger class sizes, higher teaching loads for faculty and programmatic reductions or eliminations. While medical schools are less impacted than the rest of the public universities (because of federal funding support for sponsored research and clinical income), the UC medical schools (similar to Stanford) will also be reducing programs and recruitments, although these will vary school by school.

As is evident to each of you, the economic toll continues to mount. While evidence of financial recovery on Wall Street and a rising stock market give some hope for the future, the impact on states and communities remains enormous. With the added and exceptionally deep fiscal crisis now unfolding in California, the impact on social and human services, including education, is alarming.

Despite all the changes and challenges, I still remain optimistic about our future, although a number of important issues lie ahead. Among these is the future of funding for biomedical research once the ARRA stimulus funds have been spent, which will be just over a year from now. Clearly the FY11 budget for the NIH will be a strong harbinger of what lies ahead. And then, of course, the impact of healthcare reform and its necessary focus on cost containment will surely effect clinical revenues for hospitals and physicians – although the exact form this will take will likely be better defined in the Fall and Winter.

These external challenges continue to reaffirm why our internal planning efforts remain so important. We have continued to implement our strategic initiatives, first defined around “Translating Discoveries.” The ongoing challenge is to secure and preserve the fundamental underpinnings of this strategic plan while also adapting and modifying it to the changing external forces around us. This requires even more focused and concerted interactions among faculty, between departments and institutes, with the hospitals and community and in partnership with the University. It won't be easy but it can be accomplished and it will be our job – together – to assure we are successful.

Update on Facilities

Progress is continuing on the School of Medicine's two major new facilities – the Li Ka Shing Center for Learning and Knowledge (LKSC) and the Lorry Lokey Stem Cell Research Building. In fact, the LKSC is nearly four months ahead of schedule, and it is currently anticipated that the

construction project will be completed at the end of 2009. I toured both buildings this past week and am very pleased with the progress to date. If the schedule holds, the fit-out of the LKSC (which includes a very significant amount of AV equipment) will be done in the first several months of 2010 and, if luck holds, we could begin using the LKSC for official teaching and related functions late next Spring. That would be great news indeed. If you are interested, you can view the current status of the LKSC – as well as archived time line photos of the building’s construction and evolution at:

<http://www.earthcam.net/users2/interface.php?i=0&id=1632&projectid=1010&clientid=778>)

Similarly, the Lorry Lokey Stem Cell Research Building is also on schedule and is expected to be completed by the summer of 2010. We hope to begin moving faculty into the Lokey Stem Cell Building in the Fall of next year. This will be great news as well. In addition to the construction of the LKSC and the Lokey Stem Cell Building, work is underway on the Academic Walk and Discovery Walk, which will create new corridors and pathways for the Medical School campus. With the completion of our major “Connectivity Project,” deliveries to our Medical School buildings and related traffic are already being made through underground tunnels, leaving the future Academic and Discovery Walk(s) to pedestrian and bicycle traffic.

If you haven’t been over to the new Science and Engineering Quad (SEQ2) for a while, you might want to take a walk to that construction site, which is also progressing magnificently. The Y2E2 (aka the Jerry Yang and Akiko Yamazaki Energy and Environment Building) that borders Via Ortega and Panama Avenue has been open for a year – but the Engineering Center and Nanotechnology Buildings are also progressing very nicely. Highly relevant to the Medical School will be the fourth building on the SEQ2 – the BioEngineering/Chemical Engineering Building. The School of Medicine is working closely with the School of Engineering on the design and planning for the Bioengineering Building, the construction of which should begin in 2011. It is another exciting opportunity to help support our faculty, students and staff.

We are also continuing to make progress on the design and plans for the Jill and John Freidenrich Center for Translational Medicine, which will be constructed on the site of 800 Welch Road and which will house the NCI-designated Cancer Center, Spectrum (the home of Stanford’s NIH-funded Clinical and Translational Science Award [CTSA]) and other key supports for clinical and translational research.

We will also be resuming our planning for Foundations in Medicine 1 (FIM1), which we have put on hold during the past 10 months due to the profound fiscal downturn. The planning will permit us to move the design of this important facility forward, recognizing that two important obstacles will need to be overcome before we can move from design and programmatic planning to construction. One is the resolution of the “entitlement approvals” for this facility, since it is located in the City of Palo Alto and, as a result, is part of the hospital renewal process. That process has been confounded by the incredible demands of the City Council that have slowed down the hospital reviews. At this point, we do not expect that an entitlement agreement will be reached until 2010. Of course, once that is accomplished, the second major challenge will be the funding for FIM1 – which, like our other facilities, will require a combination of philanthropic support and School financing. Needless to say, fundraising for major capital projects is particularly challenging at this time, but we are hopeful that this will change as the economy

improves. We have a compelling and exciting story to tell about FIM1 that I believe will ultimately enable us to be successful.

In addition to the continued development of our facilities on campus, we are also engaged in a number of regional “off-site” facilities discussions that are presenting some unique opportunities and that will be the topic for a future discussion.

Important News on Privacy and Medical Records

In the December 15, 2008 Dean’s Newsletter (see:

http://deansnewsletter.stanford.edu/archive/12_15_08.html#3) I informed you about two new laws that were going into effect in January 2009 and that had serious consequences for physicians, nurses and other professionals with access to medical records. Because of the importance of these new laws I am taking the liberty of noting them again as an extra reminder. They include:

Senate Bill 541 authorizes the California Department of Public Health (CDPH) to investigate unlawful or unauthorized access to, or viewing, use or disclosure of, patient information. This bill requires the hospital to report any such unauthorized access, viewing, use or disclosure of patient information within five days of its detection to CDPH and to the patient. Hospital fines for failing to prevent unauthorized access are up to \$25,000 per patient whose medical information was breached, maximum \$250,000 per reported breach.

Assembly Bill 211 authorizes a new California state office, the Office of Health Information Integrity (OHII), to investigate and enforce existing medical privacy laws and to investigate individuals and assess penalties against individuals for unauthorized access to or viewing, use or disclosure of patient information. The fines to individuals range from \$2,500 to \$250,000 for violations. No defense or indemnity coverage is provided by the hospital’s insurance policies for fines that are incurred by individuals due to violations. The fines are the personal responsibility of the individual. SB 541 requires the hospital to report individuals who violate patient privacy laws. Additionally, this new law authorizes OHII to report such violations to an individual’s licensing board for disciplinary action through the licensing board, and the licensing board is required to investigate such referrals.

As was previously noted, AB 211 places the financial burden directly on the individual provider and mandates that they personally pay whatever fines are assigned. Importantly, SB 541 mandates that hospitals monitor and report any unauthorized activity. The first evidence of material impact of these new laws was recently reported in the LA Times (see: <http://www.wired.com/threatlevel/2009/07/health-breaches/>) and in the *Journal of the American Health Information Management Association* (<http://journal.ahima.org/2009/07/07/cas-new-privacy-laws/>). So far it appears that over 800 reports of intentional and unintentional breaches of privacy have been recorded between January – May 2009, with full investigations conducted in 122 cases and 116 confirmed as breaches. Notably, 230 other cases are currently under

investigation, and 460 are pending further investigation. Financial penalties have also been imposed.

These reports serve as a reminder to pay careful attention to privacy and to not access or open any medical record for which one is not a defined medical care provider or where there is no clear authorization from the patient that permits access. If you have any questions or concerns please communicate them to: PrivacyOfficer@stanfordmed.org.

Put another way, here is some advice from Ann James, Senior University Counsel:

Privacy of patient information is central to the care provided at Stanford. As a general rule, no physician can access any patient record unless he or she (a) has treatment responsibilities for the patient or (b) has another permissible need to know (such as supervision of your residents or quality-of-care reviews). This applies whether the individual is a friend, a colleague or even a family member; it is mandatory that every physician has either specific documented permission or a treatment or other permissible need to know before accessing the record.

If a physician is not on the treatment team, but a family member or friend requests that the physician access his/her medical record, the family member or friend should go to the Release of Information (ROI) desk, located in the basement of SHC. Elena Miller, Administrative Director for Health Information Management Services (HIMS) suggests that Genise Burgess, the manager of the area, be asked to assist, to ensure that the form is completed accurately. There the family member or friend will complete the authorization form. The family member or friend will authorize the physician's access to the medical record; while ordinarily such authorization can be limited, HIMS will require full access in this case, because HIMS cannot filter what the physician is viewing through EPIC. If the individual wants the physician to see only a component of the record, then HIMS will need to print the release and deliver it to the physician. The signed form will be maintained by HIMS in the record. Every authorization has an expiration date established by the patient, so if short-term or ongoing access is requested, the patient indicates that on the form. Hospital compliance is developing a policy summary that will, in one place, address all these access and privacy issues, but that policy is not yet completed. In the meantime, this is the current process.

Under a new state law, if the Hospitals detect impermissible access to patient information, they are required to report it immediately to the State and to the affected patient(s), even if the person who accessed the record does not tell anyone else but viewed the record without a permissible reason. New federal law extends these reporting requirements to the School of Medicine (and any other part of the "HIPAA Covered Entity"); accordingly, privacy and security breaches will also need to be reported to the U.S. Department of Health and Human Services and to the affected patient(s). These laws are designed to increase the transparency of the practices of both institutions and individual health care providers, and, when a breach affects numerous patients, the affected hospital and the School will be required to report it to the media.

Every physician should be sensitive to and aware of the need for privacy for records and for patients themselves. It is important for faculty to emphasize this to residents, fellows, students and all trainees, because the consequences can be quite serious. If you have any questions about permissible access to patient information, please review the HIPAA privacy policies (found

at http://hipaa.stanford.edu/policy_privacy.html) or contact Todd Ferris, School of Medicine Privacy Officer.

2009 McCormick Faculty Awards

The Office of Diversity and Leadership of the Stanford University School of Medicine invites applications for the 2009 McCormick Faculty Awards. The McCormick Funds were established to support the advancement of women in medicine and/or medical research directly, or by supporting the mentoring, training and encouragement of women pursuing the study of medicine, in teaching medicine, and engaging in medical research. Awards are unrestricted and will be for \$30,000 per year for two years. The committee expects to make three awards each year. Proposals should be submitted electronically to Jennifer Scanlin in the Office of Diversity and Leadership at jscanlin@stanford.edu by 5pm on August 31, 2009. Further information can be obtained at: http://med.stanford.edu/diversity/faculty/09mccormickcall_apps.html

2010 Faculty Fellows Program

The Office of Diversity and Leadership has announced the launch of the 2010 School of Medicine ***Faculty Fellows Program***. Now commencing its fifth year, the program will focus on a select group of Assistant and Associate Professors as Faculty Fellows for the 2009-2010 academic year. The purpose of the Faculty Fellows program is to identify and develop a diverse group of faculty with the potential to become our future leaders.

During the yearlong program, Fellows attend monthly dinner meetings with key University leaders including President John Hennessey, Provost John Etchemendy and Dean Philip Pizzo. Each speaker shares their “Leadership Journey” and engages fellows in a discussion about their leadership philosophy, strategy and style. In addition, Fellows participate in small monthly mentoring groups led by a senior Professor; and in a structured Career Development Planning process with their division chiefs or department chairs to craft a specific, career development action plan which the fellow will implement over the subsequent year.

If you are interested in being nominated for this opportunity, ask your Department Chair or Chief to nominate you. Criteria to apply:

- Assistant or Associate professors
- Demonstrated interest in, and potential for leadership
- Respected by colleagues
- Has the ability to influence others
- Can advocate for change
- Values diversity
- Thinks strategically and systemically
- Interested in taking on leadership roles in the future

Further information, future meeting dates and application can be obtained at: http://med.stanford.edu/diversity/leaders/fellows_nominations2010.html

Innovations in Patient Care Program 2009 Grant Awards

The Innovations in Patient Care (IPC) Program at LPCH is pleased to announce that 10 proposals have been funded through their program, which is made possible by a grant from the Lucile Packard Foundation for Children's Health (LPFCH) and has been supporting interesting and exciting research in patient care across all disciplines at LPCH since 1997.

This broad-based grant program seeks to enhance patient care research from all caregivers and clinicians at Packard, and provides funding of basic science, clinical, or systems creative ideas that represent significant departures from conventional thinking. Many funded projects have led to external funding and have changed clinical practice here at LPCH.

All LPCH employees and medical staff from all disciplines of patient care are able to apply for funding for their ideas, including first-time and new researchers. Proposals are encouraged to target many areas of patient care, including clinical care methods, patient education, error prevention, access to care, customer service, cost reduction, documentation, and many more.

The IPC Program is designed to fund original, well-developed and cutting-edge proposals which meet one or all of four major goals:

- Improve the quality of patient care at LPCH through innovative interventions
- Promote the efficient and appropriate use of resources and diagnostic/therapeutic services at LPCH
- Address issues of uncertainty or variations in patient care
- Control and/or reduce the cost of patient care while maintaining or improving quality

The 2009 IPC Committee is co-chaired by Anne Dubin, MD, and Annette Nasr, RN, PhD. For information contact: Gisela Hoelzl, IPC Coordinator 650-736-0068
giselaH@stanford.edu

Following is the list of grantees:

- **Julie Arafteh, RN, MSN**, Obstetric Life Support (OBLS): A Pilot Study
- **Sanjeev Dutta, MD**, Sutureless vs. Sutured Gastroschisis Closure
- **Jeffrey Feinstein, MD**, Getting it Right: Direct Measurement of Oxygen Consumption
- **Lynda Knight, RN**, Improving Code Team Performance: Implementation of Simulated Pediatric Resuscitations
- **Mendy Minjarez, PhD**, Innovative Interventions for Social Development in Children with Autism
- **Annette Nasr, RN, PhD**, Understanding the Long-Term Impact of Living-Related Liver Transplantation on the Pediatric Patient and Their Families
- **Paul Sharek, MD**, Implementation of a Renal Transplant Trigger Tool to Identify Transplant Related Harm
- **Andrew Shin, MD**, The CVICU Dashboard
- **Sandra Staveski, RN, MS, CPNP-AC**, Massage Therapy for Post-Surgery Cardiovascular Patients
- **Shannon Sullivan, MD**, Evaluation of DVD tool to enhance pediatric CPAP adherence

Awards and Honors

- **Richard A. Barth, M.D.**, Radiologist-in-Chief at LPCH, received the Outstanding Alumni Award in recognition of exceptional professional achievement from the University of California, San Francisco School of Medicine Department of Radiology and Biomedical Imaging on June 10, 2009 in San Francisco, California.
- **Phil Tsao, PhD** Associate Professor of Medicine, Cardiovascular, has been selected to serve as a member of the NIH Myocardial Ischemia and Metabolism Study Section, Center for Scientific Review, for the term July 1, 2009- June 30, 2013.
- **Rich Gaster and Drew Hall**, MSTP students and lab partners, have won two awards:
 - First prize at the 2009 BMEidea competition sponsored by the NCIIA (National Collegiate Inventors and Innovators Alliance). The goals of this competition were to identify and recognize innovative, commercially promising medical devices and technologies developed by entrepreneurial
 - First Prize at the 2009 IEEE (Institute of Electrical and Electronics Engineers) Presidents' Change the World Competition. This competition was world-wide and designed to recognize students who identify a real-world problem, apply engineering, science, computing and leadership skills to solve it, and thereby, benefit humanity or their community.

In addition to a monetary reward, in recognition of this achievement, they had a minor planet named for them by the LINEAR Program of MIT Lincoln Laboratory.
- Stephen Lin (3rd year medical student) has received a highly competitive scholarship from the Pisacano Leadership Foundation of the American Board of Family Medicine to promote future leaders in Family Medicine. Congratulations to Stephen
- Three members from the **Mochly-Rosen Laboratory** won top awards at the recent International Society for Heart Research (ISHR) annual meeting in Baltimore. The ISHR North American Section established the annual award to recognize outstanding research by young investigators in the field of cardiovascular science.
 - **Grant Budas, PhD**, postdoctoral student, won the ISHR Heart Research Young Investigator Award for 2009, for his paper, *HSP90-mediated Mitochondrial Import of PKC is Essential for Cytoprotection*.
 - **Suresh Palaniyandi, PhD**, postdoctoral student, received an ISHR North American chapter annual prize designed to recognize outstanding papers published by early-career authors in the *Journal of Molecular and Cellular Cardiology* (JMCC), for his paper: *Mast cells and PKC: A role in cardiac remodeling in hypertension-induced heart failure*.
 - **Julio Ferreira**, Graduate student, won an ISHR award for best poster at the North American meeting.

Appointments and Promotions

Ritu Asija has been appointed as Clinical Assistant Professor of Pediatrics (Pediatric Cardiology), effective 7/01/09.

Latanya Benjamin has been appointed as Clinical Assistant Professor of Dermatology, effective 9/01/09.

David B. Bingham has been reappointed as Clinical Assistant Professor of Pathology, effective 7/01/09.

Caroline Bowker has been reappointed as Clinical Associate Professor of Obstetrics and Gynecology, effective 9/01/09.

Clarence H. Braddock has been promoted to Professor of Medicine at the Stanford University Medical Center, effective 7/01/09.

Gregory Bunke has been promoted to Clinical Associate Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 7/01/09.

Rudolf Buntic has been promoted to Clinical Associate Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 7/01/09.

Jeremy Collins has been reappointed as Clinical Assistant Professor of Anesthesia, effective 9/01/09.

Tri Do has been promoted to Clinical Assistant Professor (Affiliated) of Radiation Oncology, effective 2/01/09.

Mark DuLong has been reappointed as Clinical Associate Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 5/01/08.

Jennifer Fang has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Neonatology), effective 2/01/09.

Anna Finley Caulfield has been reappointed as Clinical Assistant Professor of Neurology, effective 8/01/09.

Mark L Gonzalgo has been appointed to Associate Professor of Urology at the Stanford University Medical Center, effective 7/01/09.

Terri Haddix has been reappointed as Clinical Assistant Professor of Pathology, effective 9/01/09.

Cathleen Hebson has been promoted to Clinical Assistant Professor (Affiliated) of Pediatrics (Ambulatory Pediatrics), effective 2/01/09.

Chuong Hoang has been appointed to Assistant Professor of Cardiothoracic Surgery at the Veterans Affairs Palo Alto Health Care System, effective 7/01/09.

Joyce Hsu has been appointed as Clinical Assistant Professor of Pediatrics (Rheumatology), effective 7/01/09.

Reza Kafi has been promoted to Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/01/09.

Vista Khosravi has been reappointed as Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/01/09.

Joshua Kirz has been reappointed as Clinical Assistant Professor of Anesthesia (Pain Management), effective 9/01/09.

Rachel Manber has been promoted to Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 7/01/09.

Robert E. Merritt has been appointed to Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 7/01/09.

Ronald G. Milliken has been reappointed as Clinical Associate Professor (Affiliated) of Surgery (Plastic and Reconstructive Surgery), effective 5/01/08.

Leo Montejo has been reappointed as Clinical Assistant Professor of Anesthesia, effective 9/01/09.

Amen Ness has been reappointed as Clinical Assistant Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), effective 8/01/09.

Reetesh Pai has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 7/01/09.

Douglas Rait has been promoted to Clinical Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 6/01/09.

Cybele Renault has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (Infectious Diseases), effective 6/01/09.

Tohru Sato has been reappointed as Clinical Assistant Professor (Affiliated) of Medicine (Gastroenterology and Hepatology), effective 7/01/09.

Richard J. Shaw has been promoted to Professor of Psychiatry and Behavioral Sciences at the Lucile Salter Packard Children's Hospital, effective 7/01/09.

Baldeep Singh has been appointed as Clinical Professor of Medicine (General Internal Medicine), effective 7/01/09.

Diamond Tam has been appointed as Clinical Assistant Professor of Ophthalmology, effective 7/01/09.

Martin Vasquez has been reappointed as Clinical Assistant Professor (Affiliated) of Dermatology, effective 3/01/08.

Penelope Zeifert has been promoted to Clinical Associate Professor (Affiliated) of Neurology, effective 9/01/09.

Dean's Newsletter

August 31, 2009

New Beginnings: The 2009 Incoming Class Arrives

On Monday August 26th we welcomed 86 new medical students to Stanford. They were selected from an overall applicant pool of 6567, which was approximately 15% of the total applicant pool to USA medical schools. I want to begin by thanking Dr. Gabe Garcia and the Admissions Committee for the excellent job they did in bringing another outstanding group of students to our School of Medicine. We continue to have slightly more women than men among our admitted students, who also represent broad geographic and ethnic diversity. While the majority of students (41) have a permanent home address in California, 18 other states, Canada, the Bahamas and Zimbabwe are also represented. In addition, the birthplace of our students includes 20 countries across North and South America, Europe, Asia and Africa. They come from 26 public and private colleges and universities, and co-incidentally majored in 26 different undergraduate majors. Of note, 12 members of the incoming class also have Masters Degrees and 8 have PhDs. Four have done fellowships at the NIH, two have completed Fulbright Fellowships and 24 already have at least one peer-reviewed publication on their CV. As members of a global community, 27 have worked outside the USA. And needless to say, they are enormously talented outside of the classroom, with a wide array of accomplishments in community service, the performing arts and athletics. Quite an accomplished group!

Orientation was led by Dr. Charles Prober, Senior Associate Dean for Medical Education, and orchestrated by Char Hamada, Zera Murphy, Suzanne Bethard, Julia Tussing and other members of the Office of Educational Programs and Services. In addition to learning about Stanford and about the breadth and depth of educational requirements and opportunities, students also learned about our unique Educators for C.A.R.E program, the Advising Programs, and Student Life and Support programs as well as financial aid and the practical nuts and bolts of becoming a medical student. Also featured were sessions on Advocacy and Global Health, Health Disparities and Multi-Cultural Practice and the Search for Meaning in a Medical Life. Many of the students had an opportunity for "bonding" during a backpacking trip (more or less) on the weekend prior to

orientation, and everyone participated in a number of shared dinner events – including a BBQ hosted by the Stanford University Medical Center Alumni Association, where the new students met their “big sibs” from upper medical school classes. I am also pleased that students enrolled in the Masters in Medicine program also participated in the orientation and will begin their program as well.

Two events culminated the week. The first was the beginning of classes on Thursday August 27th – marking the conversion from “incoming” to officially “in place” and immersion into the academic program. The second was the celebratory Stethoscope Ceremony and Dinner that was held on Friday night, August 28th, at which parents, family and friends joined the students to acknowledge and celebrate this important transitional moment. Unlike the “white coat” ceremony held at most medical schools, we have chosen the stethoscope as a more important symbol of the physician, since it provides a means to connect the physician to her or his patient and to open the doors to compassion, professionalism and patient care. In addition to other speakers, Agnieszka Czechowicz, President of the Stanford Medical Student Association and a 4th year MD/PhD student, shared her important reflections on being a student at Stanford and offered advice to her new colleagues about how they should optimize their education as well as their personal well being.

A new academic year begins. Please join me in welcoming another stellar group of medical students to Stanford.

The Context for Medical Education in 2009

Entering medical school begins a life-altering journey filled with unanticipated opportunities, challenges and surprises. The beginning of the journey is daunting since the volume of new knowledge and its very language and culture are unique and are different from any expectations students might have ahead of time. Although “orientation” can help, the reality is that new students are parachuted into a roiling sea of facts and figures, and it simply takes a while to learn where shores and safe havens might be found. Moreover, it is simply not possible to assimilate all the knowledge that is being conveyed and, more importantly, it is necessary to prepare for a lifetime of learning. While this is exciting (in the long run) it can be overwhelming at the start, since it does truly feel like “drinking from a fire-hose.” For this reason, among others, it is important to seek the big picture and to try to put medical knowledge in an historical context that presages future learning opportunities.

Students entering medical school in 2009 face a very different knowledge base than the one encountered by those who began in 1959, the year Stanford opened its doors to new students on the Palo Alto campus and inaugurated the “Five Year Plan” in its medical curriculum. The changes that have occurred during the past 50 years are truly extraordinary in nearly every dimension and domain, and they speak deeply to the importance of science and innovation as transformers of medical care. Although my own entry into medicine didn’t commence until nearly a decade later, I too have witnessed some of the incredible changes that provide a context for the foundations of medicine that our new students will begin learning in 2009. Importantly, they also frame some of the future directions that will shape the types of medicine and healthcare that they will practice in the decades ahead.

For example, it is interesting to recall that Stanford opened its doors in 1959 (notably, in the same classrooms in which our students began their orientation and classes this week) just three years after the polio vaccine was introduced and at a time when smallpox still was a cause of major global morbidity and mortality. Over the past decades immunizations have changed the face of medicine – but for those entering the profession today, illnesses that existed in my own childhood or during my education and career in medicine are easy to forget. In addition to polio and smallpox, these include measles, rubella and mumps as well as hepatitis B (which I acquired by a needle stick injury as a fellow prior to the time when the vaccine was available), varicella, rotavirus and HPV, all of which have been controlled or eliminated with immunization. Further, diseases like *H. influenza* or *S. pneumonia*, which were major causes of morbidity and mortality, particularly in children, have been largely eliminated due to immunization.

Except for their historical significance, our new medical students are unlikely to see these infections in their medical practice, but it is important for them to know how the face of illness can be changed through science and innovation. And it is important to remember that changing societal norms and beliefs – even when not founded on fact – can reverse important advances. For example, as parents “opt out” of vaccines because they believe that these diseases are no longer a threat or because they erroneously believe that vaccines are responsible for autism or other ills, they run the risk of having these infections return and result in outbreaks that impact vulnerable populations.

Just as some diseases have been controlled or eliminated, others that were not even known when the School opened in Palo Alto in 1959 now represent global challenges. Among the most notable is HIV/AIDS – which was not part of my medical school curriculum, but which came onto the scene with a major morbidity and mortality in the 1980’s. And then there are the cyclical infections that, while known in the past, appear in new forms due to mutations, like influenza and the most recent pandemic of H1N1. In addition, there are diseases affected by society (and marketing) that can rise and fall in incidence and impact – such as smoking, which is finally ebbing in the USA due to tobacco elimination and control programs but which is still a major global cause of morbidity and mortality. Ironically, while obesity was more sporadic in 1959, it now represents an ever growing (no pun intended) cause of morbidity across the world and will be part of the 2009 curriculum.

Advances in research and innovation have improved the outcomes for a host of human ailments. Stanford has featured prominently in many of these advances including the treatment and cure of childhood cancer and a number of adult malignancies; dramatic advances in the treatment of stroke and vascular malformations, epilepsy and motor disorders; innovations in cardiovascular surgery (including minimally invasive and endovascular approaches) as well as the heart transplantation and other solid organ transplantation; new devices to replace joints or treat arthritis and vasculitis; new imaging and diagnostic procedures. Of course this is just a sampling, but it speaks to the evolution of knowledge and clinical practice that is easy to forget or overlook.

Even more important than the progress made in the past is where the future of medicine is heading. Students entering in 2009 have a much deeper understanding of the fundamentals of the

biosciences than existed in 1959, and, in many ways, many of the basic assumptions and underpinnings of human biology have been radically transformed. It is interesting to recall that students entered Stanford in 1959 just six years following the publication of Watson and Crick that forecast the structure of DNA, and right in the midst of understanding the critical roles of DNA and RNA in transcription, translation and genetic regulation. And this was prior to discovery of recombinant DNA, genetic engineering and the explosion in biotechnology that was created by Stanford scientists. To say that our knowledge of human genetics has since changed radically would be a gross understatement. Looking forward, technology and innovation will further radically transform human genomics and open the doors to “personalized medicine” (hopefully with more scientific grounding than exists today). It is clear that Stanford will lead the way in the creation of this new science and that some of our medical students entering in 2009 will participate directly in these new discoveries.

Similarly, the field of stem cell biology and regenerative medicine has evolved at Stanford and beyond to the point where it is poised to play a major role in the future of medicine. Many Stanford students are already contributing to this field and will surely be joined by those now entering medical school. Many other fields, including human immunology, cancer biology, bioengineering, and molecular imaging, are similarly poised to play a transformative role in redefining how we diagnose, treat and prevent human disease. Our New Curriculum, which has built on the Five Year Plan of 1959, still enables our students to be both learners and discoverers and to help shape the future of science and medicine.

While the opportunities in 2009 are exciting and different from those in 1959, some new and old challenges remain. Support for scientific research is highly dependent of federal sponsored research, which has undergone dramatic swings during the past decade. This has been enjoined by changing and, at times, negative perceptions of the value of science which, thankfully, appears to be on a better footing in 2009 than was the case just a couple of year ago. And while support for NIH bioscience research has been stimulated by the 2009 American Recovery and Reinvestment Act (ARRA) it remains to be seen whether this support will be sustained in FY11 – which will have implications for the careers of our students in the years ahead.

Common to 1959 and 2009 is the lack of an organized healthcare system in the USA. Attempts to organize American healthcare failed during the Truman administration, a decade before Stanford Medical School moved from San Francisco to Palo Alto. Sadly it has failed in all subsequent efforts since and while there was hope that 2009 could be a year of change, this now seems more uncertain because of the incredible polarization and political fighting now dominating Congress and being cast across the nation – often with misinformation. Unfounded rhetoric has become more common than facts, and this is taking the focus away from the most important issue – improving the health of our nation – and putting it onto ideological struggles and battles. Every day features new accusations and commentaries. In the past week, I tried to offer a more fact based commentary in the LA Times (see: <http://www.latimes.com/news/opinion/opinionla/la-oe-w-pizzo18-2009aug18,0,6235286.story>) and Richard Whyte, Professor of Thoracic Surgery offered an important perspective in the San Jose Mercury News (see: http://www.mercurynews.com/ci_13171826).

As I conveyed to our new medical students, the perception of the doctor in society has also changed during the last decades. I suspect that when students entered in 1959 (as was the case when I began medical school a decade later) medicine was still seen as a service and profession. In a number of unfortunate ways this perception has changed considerably over the ensuing decades as medicine has become more of a business and since all the perverse incentives that now negatively reflect on the medical profession – broadly defined – have assumed more center stage. It has been my hope that one benefit of healthcare reform would be to rebase the doctor-patient relationship as well as the roles that physicians play in medicine and society. With that in mind I offered some guidance to our incoming students.

First was to recognize the importance of science as the underpinning of medicine and to seek to draw connections between the two throughout their education and subsequent careers. Our New Curriculum fosters these connections and the Scholarly Concentrations create an opportunity to drill down on an area of interest with vigor and passion in an analytic and research-driven manner. I also encouraged our students to keep the patient at the center of their efforts and, in doing so, to think about the ways in which innovation and discovery can impact the lives of their patients (as has been the case over the decades). I also encouraged our students to place the quality of the care they learn about, along with its safety, cost and service at the forefront of their efforts. I encouraged them to think of their clinical work as part of a team and to avoid the trap of placing one discipline at a higher level of importance than another – particularly the relevance of primary and specialty care.

I reminded our students that, regardless of the area of medicine they ultimately pursue, learning and knowledge acquisition will go on for a lifetime – something I am reminded about virtually every day. I underscored that, in addition to being excellent physicians, a Stanford education should prepare them for broader roles as leaders and transformers – in whatever area of science or medicine they choose to concentrate. And, equally important, I reminded them that they should be open to change as new opportunities presented themselves, sometimes unexpectedly. Indeed, one of the most incredible things about a career in medicine is the prospect of pursuing new pathways at different stages of one's career. That has certainly been part of my own career, which has included roles as a scientist, clinician, administrator and advocate. Finally, I stressed that, despite the amount of work they will face (which has always been a feature of medicine), they should try to sustain the big vision and view toward the long run. A career in medicine is not a sprint, nor is it the acquisition of a static knowledge base. It is constantly changing and evolving – as is evident in the past 50 years of Stanford Medicine and will surely continue to be so in the decades ahead. And I emphasized the importance of self-care and of keeping one's own body healthy while they are pursuing the acquisition of cognitive and related skills.

During this past week of welcoming and “orienting” our new students one cannot help but recognize that they are beginning journeys of learning and contributing in which they will, both individually and collectively, transform medicine. For all of our sakes – including future generations – we wish them every success.

The Future Generation

Just as our new medical students began their orientation, some important Stanford summer programs came to an end, but only after inspiring a number of high school and college students to pursue careers in science and medicine. Hopefully, some will be future MD or PhD students at Stanford. The notable summer programs included the Stanford Medical Youth Science Program (led by Judith Ned and Marilyn Winkleby), the Stanford Summer Research Program-Amgen Scholars Program (led by William Talbot and Tenea Nelson) and the Stanford Institutes of Medicine Summer Research Program (led by PJ Utz). Each of these outstanding programs brought promising high school and college students to Stanford – many from minority or socially impoverished settings – to spend their summer in mentored research and educational experiences. The success of these programs has been remarkable, and we owe a deep debt of gratitude to the programs leaders and to the staff, faculty and students who make the summer experiences so enriching and inspiring. At a time when the pipeline for future scientists and physicians needs help, these programs provide a critical and valuable role. Thanks to all.

The Closing of the Fiscal Year and Some Challenges for the Year Ahead

On August 18th we submitted our Consolidated FY10 Budget to the University. As you certainly know, this past year has been enormously challenging for our school and the university – as well as our community and nation. The economic downturn that began a year ago had immediate and enduring impacts on our financial well-being and led to many changes. I recently wrote to our Executive Committee about the impact of the FY09 budget along and want to share some of these summary thoughts with you for context.

“... this has been an unprecedented time for virtually every sector of the national economy and resulting in major financial challenges. You also know from presentations made by the President and Provost of Stanford University that the past year has witnessed the most significant impact on university resources and endowment in history that has decimated a number of funds and put others “under water”. We have apprised you of a number of these dramatic changes at various Executive Committee meetings and departmental budget discussions.

I have also communicated more broadly about a number of these financial challenges in various Dean’s Newsletters (see: March 16, 2009

(see: http://deansnewsletter.stanford.edu/archive/03_16_09.html)

March 30, 2009 (see: http://deansnewsletter.stanford.edu/archive/03_30_09.html#4),

and May 26, 2009 (see http://deansnewsletter.stanford.edu/archive/05_26_09.html#1) You will also recall the presentations by Marcia Cohen, Senior Associate Dean for Finance and Administration, one of which occurred on March 20th, 2009, where she provided a series of updates on how the economic downturn was affecting the School of Medicine as well as plans considered for mitigating the financial impact that encompass some of the concerns that the clinical chairs communicated to me some weeks ago.

Through these newsletters and meetings, we have outlined our significant financial challenges, their impact on the School and the Departments, and discussed the plans and actions taken to preserve our programs and core missions, while at the same time reducing our overall expenses. The reality, as shared with you in these many interactions, is that not only is the endowment down approximately 30%, it is clear that the economic downturn is having both an immediate

impact and one that will endure for nearly a decade despite recent suggestions of slowing of the recession.

To survive these enormous changes it is imperative that faculty, students and staff – along with departments, centers, institutes and schools – share in the sacrifices and solutions necessary to sustain Stanford as world leader and, in our case, leading academic medical center. With this goal in mind our central Office of Finance and Administration has been working nearly non-stop in the past months to complete the School of Medicine's FY09 Year End Projections, FY10 Budget, and our Ten Year Financial Plan. Each has required the attention of every member of our teams to meet strict timelines, and we appreciate the input and help from the Chairs and Department DFAs during these past months.

For context it is important to remember that to meet the rapidly escalating financial challenges, a number of significant steps needed to be taken expeditiously. These included a reduction of our central administrative workforce that ultimately resulted in a total of 40 staff who were affected either through a layoff or reduction in FTE. These layoffs and effort reductions were completed in early June and impacted approximately 7% of the non-departmental central administrative staff workforce.

Reducing staff through layoffs has had a profound impact on all of us and these decisions were not made lightly. The elimination of these positions not only affected the individual employee and his/her family, but also deeply affects the morale and engagement of the staff who remain in their positions. And yet, as you are well aware, these unprecedented staff reductions in the central administrative staff were not sufficient to close the financial gap caused by these unprecedented fiscal challenges.

As a result, and with the evolving financial situation, we implemented a number of other cost reductions, delays, deferrals, and in some cases the transfer of the responsibility for some faculty-related costs to Departments.... At the same time it is important to underscore that we have striven to honor and sustain the prior commitments for resources made to departments, centers and institutes, although in some instances these payments will occur over a longer time-line.

It is important to underscore that we have tried to focus the costs and reductions of staff, programs and resources within the central administration of the school and to spare, as much as possible, the impact on departments. But to preserve the integrity of our support for education and research, we have also had to share (aka transfer) some of the expenses to the departments – which we recognize is unpopular but for which there is no real choice.”

I also shared these thoughts with the President's Executive Cabinet on August 28th. I also reflected with this group on some of the challenges we face during the next year(s) on a broad school wide level. Needless to say, there are many more issues we will need to face and reconcile, but I want to share some of the high-level ones with you as well. Please remember that this list is incomplete and does not specifically address faculty, departments, centers and institute issues *per se*. But it should give you an idea of some of the things I am focusing on in the months ahead.

- Sustaining and improving the School, Medical Center and University missions during a time of economic turmoil:
 - Preparing for the uncertainty regarding NIH funding in FY11
 - Anticipating the cost-containment that will result from whatever healthcare reform is passed
 - Impact on physician (faculty) compensation
 - Impact on payments to providers – including hospitals
 - Continuing to prioritize and make choices at the central level as well as choices and priorities at the departmental, center and institute level
- Leading and collaborating in integrated planning across the Medical Center, focusing on clinical program development and excellence according to the plans listed above
 - Initiatives to foster innovation as well as clinical and translational research
 - National Cancer Institute review of Stanford Cancer Center this Fall
 - Stanford's Clinical and Translational Science Award (CTSA) – further development of programs and services
 - Establishment of the Center for Sleep Sciences and Medicine
 - Strategic Planning for the Office of Global Health
 - Clinical integration
 - Complete “Funds Flow Model” with LPCH to complement that at SHC
 - Clinical program coordination around:
 - Quality and effectiveness
 - Cost reduction
 - Patient satisfaction
 - Clinical planning and projections for primary care, specialty services and strategic services
 - Regional care and partnerships
 - Potential new initiatives
 - Explore possibilities for a Hadron Center (Hadron is heavy ion radiation therapy, particularly proton and carbon).
- Maintaining morale and improving career development during challenging times – especially for clinical faculty
 - Seek ways to support (where possible) postdoctoral fellows and junior faculty during the national freeze on positions
 - Generate support for junior faculty and more advanced investigators in the basic sciences
 - Post-2009 School of Medicine Leadership Retreat department based action plans re: career development, role of clinical faculty, mentoring
 - Continuing to address diversity and leadership
- Recruiting outstanding faculty and leaders. At the end of the day it is the excellence of our faculty, students and staff that will make the greatest impact on our future. During the next several years a number of important leadership positions will need to be replaced – all with attention to assuring excellence, diversity and leadership.

- Continued work with Dean Plummer and the chairs to support the further development of the Department of Bioengineering
- Sustaining and enhancing medical development despite the economic slowdown for the School and our hospital partners
 - Coordination of efforts within the medical school and with the university
 - Generating support for graduate students and professorships
- Short and long term master facilities planning for both on campus and off-campus facilities:
 - Opening of the Li Ka Shing Center for Learning and Knowledge in 2010
 - Opening of the Lorry Lokey Stem Cell Research Building in 2010
 - Work with SHC and LPCH leaders on Hospital Replacement and Renewal
 - Work with Dean Plummer and SoE on the Bioengineering Building
 - Planning for the Jill and John Freidenrich Center for Translational Medicine
 - Major review of off-site leases
 - Planning for FIM1 and SIM2
- Improving leadership locally and nationally to advance Stanford Medicine – including my own roles that are engaged in working on funding for research, healthcare reform and the future of academic medicine.

CAP and Disclosures

On August 26th Dr. Harry Greenberg, Senior Associate Dean for Research, sent the following message to our faculty. Because this topic is of broad interest and importance I want to share it with our entire community. Here it is:

“As you may recall Dean Pizzo announced in his March newsletter our intention to create a new section on everyone's CAP profile to list Industry Interactions which are related to their professional activities and are over \$5000/year (see http://deansnewsletter.stanford.edu/archive/03_30_09.html#6). The information shown on an individual's profile was to be taken directly from each individual's annual OPACS form filled out earlier this year.

I am happy to let you know that after a great deal of hard work from the team in IRT this new feature of our faculty profiles system was launched today. Information submitted in the 2008 OPACS survey has been pre-loaded onto your CAP profile and going forward appropriate information from your annual OPACS survey will flow directly onto your CAP profile the day following final submission.

You will not be able to edit information from OPACS directly within the CAP system so if you identify mistakes or inaccuracies in your own profile information, please contact Barbara Flynn (bflynn@stanford.edu) who will be responsible for ensuring this information is corrected and accurate.

For now, we plan to update the Industry Interaction information annually at the time you fill out your annual OPACS disclosure and this section of the profile will only show if relationships are reported that fit the minimum criteria. We think this new component of CAP will make our faculty profiles even more informative for our academic and industry colleagues, and for the practicing physicians among us and their patients as well.

Centennial Time Capsule Placed in LKSC

As you may recall, part of our Centennial celebration that took place in Spring 2008 included the collection of items for the Stanford University School of Medicine Time Capsule.

Last week our Centennial Time Capsule was placed underneath a classroom floor on the ground floor of the Li Ka Shing Center for Learning and Knowledge now under construction. Once the building is finished, a plaque will be put on the wall indicating that the capsule resides in the room and that it is to be opened in the year 2058. The original plan was to keep the capsule sealed for 100 years. However upon further research we discovered various reasons to move the opening up by 50 years. Perhaps some of our current students will be able to attend the unveiling in 2058! Additionally, the Stanford University School of Medicine Centennial time capsule has been registered with the International Time Capsule Society.

You can read more about the Centennial Time Capsule placement at:
<http://med.stanford.edu/ism/2009/august/capsule.html>.

Upcoming Event

Obesity Summit – Friday September 18th, Arrillaga Alumni Center

All members of the research community are invited to attend an Obesity Summit co-chaired by Dr. John Norton and Dr. Chris Gardner. As you know, obesity is the leading public health issue threatening to consume life expectancy and finances alike. Obesity researchers from a wide range of fields will present their work from surgery and microbiology to economics and the environment. In addition, the school of medicine is applying to become an NIH/NIDDK Nutrition Obesity Research Center (NORC – P30), one of fourteen in the country. This forum will give us an opportunity to discuss how a NORC can facilitate further obesity research at Stanford.

Please contact Kattc@Stanford.edu for further questions and if you are interested in attending.

Awards and Honors

- **Jason Bartos**, a rising fourth year medical student has been named one of ten recipients of the AMA Foundation's Physicians of Tomorrow Scholarship – which carries a scholarship award of \$10,000 to defray the cost of medical school education. Congratulations to Jason.

Appointments and Promotions

Ronald C. Albucher was promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Vaden Health Center), effective 9/01/09.

John W. Ashford was appointed as Clinical Professor (Affiliated) of Psychiatry and Behavioral Sciences, effective 9/01/09.

Walid S. Ayoub was reappointed as Clinical Assistant Professor of Medicine (Gastroenterology and Hepatology), effective 8/01/09.

Martin Bronk was appointed as Clinical Associate Professor of Surgery (General Surgery), effective 8/15/08.

Frandics P. Chan has been promoted to Associate Professor of Radiology at the Stanford University Medical Center, effective 8/01/09.

Jane T. Chueh was promoted to Clinical Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), effective 9/01/09.

Tami Daugherty was reappointed as Clinical Assistant Professor of Medicine (Gastroenterology and Hepatology), effective 8/01/09.

Laurel G. Dawson was reappointed as Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/09.

Timothy Dawson was promoted to Clinical Assistant Professor of Anesthesia (Adult Pain), effective 9/01/09.

Gayle Deutsch was promoted to Clinical Associate Professor (Affiliated) of Neurology, effective 8/01/09.

Yasser Y. El-Sayed has been promoted to Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 8/01/09.

Paul G. Fisher has been promoted to Professor of Neurology and Neurological Sciences and of Pediatrics, and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 8/01/09.

Hayley Gans has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 8/01/09.

Victoria Fong was reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 2/01/09.

Francis Brendan Garrett was appointed as Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 8/01/09.

Nicholas J. Giori has been promoted to Associate Professor of Orthopaedic Surgery at the Veterans Affairs Palo Alto Health Care System, effective 8/01/09.

Michelle C. Holmes was appointed as Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 9/01/09.

Kristin Jensen has been reappointed to Assistant Professor of Pathology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 8/01/09.

Michelle Jordan was reappointed as Clinical Assistant Professor (Affiliated) of Pathology, effective 8/01/09.

Madelyn Kahana has been appointed to Professor (Teaching) of Pediatrics and Anesthesia, effective 9/01/09.

Ahmad Kamal was promoted to Clinical Assistant Professor (Affiliated) of Medicine (Gastroenterology and Hepatology), effective 9/01/09.

Peter Karzmark was promoted to Clinical Associate Professor (Affiliated) of Neurology, effective 8/01/09.

Richard Kramer was reappointed as Clinical Associate Professor (Affiliated) of Medicine (Gastroenterology and Hepatology), effective 9/01/09.

Yueh-Tze Lan was promoted to Clinical Assistant Professor (Affiliated) of Pediatrics, effective 7/01/09.

James S. Lin was appointed as Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 7/01/09.

Artis Montegue was reappointed as Clinical Assistant Professor of Ophthalmology, effective 8/01/09.

Darius Moshfeghi has been promoted to Associate Professor of Ophthalmology at the Stanford University Medical Center, effective 8/01/09.

Peter Moskowitz was reappointed as Clinical Professor of Radiology, effective 7/01/09.

Edwin Petrossian was reappointed as Clinical Associate Professor of Cardiothoracic Surgery (Pediatric Cardiac Surgery), effective 7/01/09.

Nalini Raju was appointed as Clinical Assistant Professor of Surgery (General Surgery), effective 7/01/09.

Erich Schwartz has been reappointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 8/01/09.

Subhro Sen was appointed as Clinical Assistant Professor of Surgery (Plastic and Reconstructive Surgery), effective 9/01/09.

Christopher Sharp was promoted to Clinical Associate Professor of Medicine (General Internal Medicine), effective 5/01/09.

Dennis Siegler was promoted to Clinical Associate Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Manjula Tamura has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 8/01/09.

Simon Tan was promoted to Clinical Assistant Professor (Affiliated) of Neurology, effective 8/01/09.

Hua Tang has been promoted to Associate Professor of Genetics, effective 9/01/09.

Robyn S. Tepper was reappointed as Clinical Assistant Professor of Medicine (Family Medicine – Vaden Health Center), effective 9/01/09.

Wendy T. Thanassi was promoted to Clinical Assistant Professor of Surgery (Emergency Medicine), effective 9/01/09.

Raziya Sunderji Wang was promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Vaden Health Center), effective 9/01/09.

Ian Whitmore has been reappointed to Professor (Teaching) of Surgery, effective 10/01/09.

Dean's Newsletter September 14, 2009

Preparing for H1N1

With the influx of students expected over the next weeks and the change of seasons from summer to fall, concerns about flu and especially H1N1, will become an issue of increasing concern and attention. It is notable that during the summer months we have seen as much influenza at Stanford and LPCH as we generally do during the winter. Since April, more than 1 million Americans have contracted H1N1 and while the disease course has been generally mild, contrasts are often made to the 1918 H1N1 pandemic which also started in the spring but returned in the fall and winter with markedly increased virulence resulting in the worst influenza pandemic in recorded history. At least to date, the indicators suggest that while H1N1 will be common this fall and winter, its virulence and consequent mortality is likely not going to be greater than seasonal flu. That said, preparedness, attention to public health and vigilance is important. We share in this responsibility.

The Centers for Disease Control has published updated recommendations for H1N1, including the observation that as of August 2009, 98% of the influenza isolated in the USA is H1N1. A similar pattern is being reported from the southern hemisphere (where winter is coming to a

close). While widespread cases of H1N1 have been reported, the “good news” is that the mortality rates observed to date have not been high (compared to initial fears) and the virus remains sensitive to two antiviral agents. While this is comforting, it must be recognized that the possibility for new and more virulent and/or drug resistant strains of H1N1 to emerge in the months and years ahead remains a major concern.

It is important that we keep up with the evolving nature of the H1N1 pandemic. Accordingly, I am including below the most recent summary from the CDC. I also suggest that you bookmark the CDC website regarding H1N1 (see: <http://cdc.gov/h1n1flu/recommendations.htm>) as well as a useful site entitled What To Do About the Flu (<http://www.flu.gov/>) that consolidates and coordinates various information sources.

First and foremost, there are simple things we all should do to decrease the spread of infections. The CDC provides a summary of these http://www.cdc.gov/flu/protect/habits.htm?s_cid=swineFlu_outbreak_003 and they are consonant with the practices being recommended at the Medical Center and University. They include the following recommendations:

Avoid close contact.

Avoid close contact with people who are sick. When you are sick, keep your distance from others to protect them from getting sick too.

Stay home when you are sick.

If possible, stay home from work, school, and errands when you are sick. You will help prevent others from catching your illness.

Cover your mouth and nose.

Cover your mouth and nose with a tissue when coughing or sneezing. It may prevent those around you from getting sick.

Wash your hands.

Washing your hands often will help protect you from transmitting and acquiring influenza and other germs.

Avoid touching your eyes, nose or mouth.

Germs are often spread when a person touches something that is contaminated with germs and then touches his or her eyes, nose, or mouth.

Practice other good health habits.

Get plenty of sleep, be physically active, manage your stress, drink plenty of fluids, and eat nutritious food.

In many ways these recommendations are similar to what we all learned from our “mothers and grandmothers” – but they do work. I particularly want to highlight the importance of staying away from work if you have symptoms of flu – an admonition that is of particular importance to those on the front lines of care (e.g., residents, fellows, nurses)

The CDC has also published guidelines on risk groups as well as the diagnosis and treatment of H1N1. Here is the summary of the CDC recommendations

(<http://cdc.gov/h1n1flu/recommendations.htm>):

- Treatment with oseltamivir or zanamivir is recommended for all persons with suspected or confirmed influenza requiring hospitalization.
- Treatment with oseltamivir or zanamivir generally is recommended for persons with suspected or confirmed influenza who are at higher risk for complications (children younger than 5 years old, adults 65 years and older, pregnant women, persons with certain chronic medical or immunosuppressive conditions, and persons younger than 19 years of age who are receiving long-term aspirin therapy).
- Persons who are not at higher risk for complications or do not have severe influenza requiring hospitalization generally do not require antiviral medications for treatment or prophylaxis. However, any suspected influenza patient presenting with warning symptoms (e.g., dyspnea – shortness of breath) or signs (e.g., tachypnea, unexplained oxygen desaturation) for lower respiratory tract illness should promptly receive empiric antiviral therapy.
- Clinical judgment is an important factor in antiviral treatment decisions for all patients presenting for medical care who have illnesses consistent with influenza.
- Treatment should be initiated as early as possible because studies show that treatment initiated early (i.e., within 48 hours of illness onset) is more likely to provide benefit.
- Treatment should not wait for laboratory confirmation of influenza because laboratory testing can delay treatment and because a negative rapid test for influenza does not rule out influenza. The sensitivity of rapid tests can range from 10 % to 70%. View information on the use of rapid influenza diagnostic tests (RIDTs).
- Testing for 2009 H1N1 influenza infection with real-time reverse transcriptase-polymerase chain reaction (rRT-PCR) should be prioritized for persons with suspected or confirmed influenza requiring hospitalization and based on guidelines from local and state health departments.
- Groups at higher risk for 2009 H1N1 influenza complications are similar to those at higher risk for seasonal influenza complications.
- Actions that should be taken to reduce delays in treatment initiation include:
 - Informing persons at higher risk for influenza complications of signs and symptoms of influenza and need for early treatment after onset of symptoms of influenza (i.e., fever, respiratory symptoms);
 - Ensuring rapid access to telephone consultation and clinical evaluation for these patients as well as patients who report severe illness;
 - Considering empiric treatment of patients at higher risk for influenza complications based on telephone contact if hospitalization is not indicated and if this will substantially reduce delay before treatment is initiated.

- In selected circumstances, providers might also choose to provide selected patients at higher risk for influenza-related complications (e.g., patients with neuromuscular disease) with prescriptions that can be filled at the onset of symptoms after telephone consultation with the provider.
- Antiviral chemoprophylaxis generally should be reserved for persons at higher risk for influenza-related complications who have had contact with someone likely to be infected with influenza.
- Based on global experience to date, 2009 H1N1 influenza viruses likely will be the most common influenza viruses among those circulating in the coming season, particularly those causing influenza among younger age groups. Circulation of seasonal influenza viruses during the 2009-10 season is also expected. Influenza seasons are unpredictable, however, and the timing and intensity of seasonal influenza virus activity versus 2009 H1N1 circulation cannot be predicted in advance.
- Persons with suspected 2009 H1N1 influenza or seasonal influenza who present with an uncomplicated febrile illness typically do not require treatment. However, some groups appear to be at higher risk for influenza-related complications.
- Currently circulating 2009 H1N1 viruses are susceptible to oseltamivir and zanamivir, but resistant to amantadine and rimantadine; however, antiviral treatment regimens might change according to new antiviral resistance or viral surveillance information.
- Information on the dose and dosing schedule for oseltamivir and zanamivir is provided in this document. An April 2009 Emergency Use Authorization authorizes the emergency use of oseltamivir in children younger than 1 year old, subject to the terms and conditions of the EUA

I also call your attention to the excellent presentation on H1N1 recently given by Dr. Bonnie Maldonado, Chief of Pediatric Infectious Disease and Professor of Pediatrics (see: <http://med.stanford.edu/121/2009/maldonado.html>) and to the Stanford Medicine website on H1N1 (see http://stanfordmedicine.org/getting_care/influenza.html).

While none of us can predict exactly how this flu season will resolve, I do think that Stanford Medical Center and University are well prepared. The planning and coordination for emergency preparedness over the past years, together with the real-life dress rehearsal that began with the outbreak on H1N1 in April, has led to heightened preparations and coordination within the medical center. The efforts of Dr. Kevin Tabb, Chief Medical Officer at SHC, Dr. Christy Sandborg, Chief of Staff at LPCH, Dr. Eric Weiss, Medical Director of Disaster Planning along with infectious disease specialists Drs. Lucy Tompkins and Bonnie Maldonado, are particularly appreciated. In addition to the excellent preparative efforts, considerable research activity on influenza is underway at Stanford from a variety of different angles and disciplines (see: <http://med.stanford.edu/ism/2009/september/flu-tip-sheet.html>).

While there are reasons for concern, there are also grounds for optimism, including the prevention and treatment programs now in place, the process plans for screening and evaluating patients seeking medical care and the very real prospects for an H1N1 vaccine in the next couple of months. That said, our success during the flu season will largely rest on the self-care and prevention exercised by our medical staff and community. This includes early recognition of flu-like symptoms that should prompt care providers to stay home to avoid more widespread treatment. It includes frequent hand cleansing – which should be at the 100% level. There is simply no excuse for falling short of this goal. And it will include complete compliance with immunizations once the flu vaccines become available.

It will be important for each of us to stay informed and to do our part in protecting ourselves, each other and our community.

Whither or Whether Healthcare Reform

In my July 6th *Dean's Newsletter* I drew parallels between the healthcare debate and the hot and stormy weather in DC where the debate would rage (see: http://deansnewsletter.stanford.edu/archive/07_06_09.html#2). In retrospect I would have to say that my “weather” forecast was directionally correct but did not predict the heat of the debate or the lack of clarification and accuracy of the discussion or the thunderous allegations that were made – many of which were aimed at generating fear rather than rational thinking. Until the President made his speech before the Joint Session of Congress on September 9th, it seemed as if any chance for serious healthcare reform was going down the proverbial storm drain. And while an opportunity for some progress again seems possible, the chances for serious reform seem less hopeful than in the spring. For example, the public insurance option, which I believe is important to serious insurance industry reform, seems much less likely to be part of whatever healthcare reform occurs in 2009. The fact that it is so threatening to the insurance industry is an indicator of how much it might change the status quo – which we all recognize is unsustainable.

As the glow of President Obama's healthcare address begins to fade, the voices of the major constituencies (often through teams of lobbyists) are trying to reshape the discussion and the prospects for reform. One of the voices that is less clearly aligned to its own constituency is that of the American Medical Association (AMA). While the AMA certainly is a voice that deserves to be heard, it should not be conveyed as “representing American doctors” – which it does not. Of course this leaves the question open about whether any organization or professional group does speak for the majority of physicians. Indeed the very fact that there is no such group means that doctors are not directly shaping healthcare reform and that those who are at the table may be representing the interests of a relative minority.

While not a broadly representative group, the “Physician's Foundation”, a non-profit organization established in 2003, issued a report on September 9th on issues it felt were relevant to healthcare reform. These resulted in six major goals:

1. Physician workforce

Undertake a major expansion of the physician workforce by enlarging the infrastructure of medical school and residency education. Many actions will be necessary, but removing

Medicare's caps on support for residency positions is essential. Because these efforts will not reach fruition for fifteen years or more, other near-term strategies will be needed.

2. Team building

Build the workforce of midlevel practitioners, particularly nurse practitioners and physician assistants, who will be critical members of clinical teams and important providers of primary care. Simultaneously build the workforce of nurses, aides, technicians and others, and downstream tasks from more highly trained clinicians to those who have less-complex training but the requisite skills to provide care competently.

3. Primary care

Build a broad system of front-line primary care and public health services that reach deep into communities and that recognize the varied patient needs in different income groups.

4. Specialty mix

Faced with physician shortages, emphasize physician training in areas where physicians are uniquely capable of providing care, predominately in the medical and surgical specialties. At the same time, reshape the career paths of generalist physicians to take advantage of their capacity to manage chronic illness and multisystem diseases and their parallel abilities to give consultative support to midlevel primary care providers.

5. Education

Shorten the length of medical education from premed through residency, and realign medical education with the realities of clinical practice and the necessary roles of physicians in the future in both urban and rural settings.

6. Autonomy

Equip physicians with better information technology and more access to medical effectiveness research, but do not burden physicians with practice incentives that fail to recognize the vast differences in socioeconomic characteristics among patients and among regions. At the same time, create a Medicare reimbursement formula that is grounded in the reality that physician services will continue to grow in quantity and complexity. And recognize that, ultimately, physician autonomy is the friend of quality.

A number of these recommendations are sound and relevant, whereas others (such as the need to expand the number of medical schools or medical school class size) may be less well founded. Nonetheless, a number of these goals align to recommendations from other organizations, including the Association of Academic Health Centers (AAHC), for which I currently serve as Chair-Elect of the Board of Directors. Specifically, AAHC concurs that comprehensive health workforce reform is essential to any broader healthcare reform agenda. Importantly, AAHC believes that the policymakers currently involved in developing healthcare reform legislation are focused on two discrete issues (the supply of primary care and the reform of graduate medical education) without addressing the broader spectrum of health workforce challenges.

Accordingly, AAHC has recommended the creation of a national health workforce planning committee to develop and implement the integrated, comprehensive national health workforce policies necessary for healthcare reform to succeed. In parallel, AAHC has underscored that reimbursement reforms should support and not undercut the national workforce priorities or the financial integrity of the nation's academic medical centers.

The next months will be a time of heightened debate, lobbying, policy clarification and position entrenchment. At the end I hope we won't lose sight of the primary issues that underpin the need

for healthcare reform – including a rebasing of the role of physicians in the delivery of patient care as well as in research and education. I also hope that the voice of physicians will be heard in more representative ways – something we can all contribute to through our specialty and professional societies. Let’s hope that at year’s end we will see evidence of healthcare reform that is blooming or at least budding – and hopefully not withering, as has been the case in recent months. It is time to move forward.

Medical Students Learn About As Well As Initiate Leadership Roles

A major goal of our education programs has been to educate and train future leaders in medicine and science. It is particularly gratifying when students take on and promote major leadership initiatives. There are many examples of this at Stanford and I want to highlight a recent one.

On September 8th a 12-week student directed course on “Medical Leadership Development” commenced under the leadership of three medical students and a surgical resident. Matt Goldstein (SMS5), Robin Eisenhut (SMS2), Tiffany Castillo (SMS4) and Bernard Palmer, MD. serve as Course Directors along with Dr. Charles Prober, Senior Associate Dean for Medical Education as Faculty Director and Julia Tussing, Associate Dean for Education Programs and Services, as Course Facilitator. The primary objective of the curriculum “is to provide students with a theoretical and functional knowledge of leadership through participation in activities of self-discovery and leadership immersion”. The program consists of “fireside sessions” with leaders in academic medicine who share a personal journey of their career and the lessons they have learned along the way. I had the privilege of being the first speaker with subsequent sessions to be given by Drs. Sherry Wren, Clarence Braddock, Lisa Chamberlin, Ralph Horwitz, Oscar Salvatierra and Charles Prober. Alternating with these presentations and discussions are skill workshops based on defined issues and challenges in leadership and readings that provide background and data to enlighten the issues and discussions. This is an excellent program and while the participation is limited to just a dozen students, I am certain that each will have a rich and informative experience. I want to offer my gratitude and commendation to the course directors for their initiative in bringing this course to fruition.

Conflicts by Big Pharma Have Consequences

Over the past several years we have had a substantive discourse about conflicts of interest and the intertwining of industry support into education, research and patient care. These prompted us to take important stands on industry interactions (see: <http://med.stanford.edu/coi/siip/>) that have banned certain activities (e.g., gifts, “free lunches,” ghostwriting) and curtailed others (industry support for continuing medical education). We have done these in order to separate the role of physicians as scientific advisors and consultants to industry from that of marketing for industry. While most physicians believe that they are not likely to be biased or influenced by industry marketing tactics, the reality is, unfortunately, quite different.

Although we would all like to believe that individual and institutional integrity prevails in medicine and science, remarkable examples of where this has not been the case serve to underpin the importance of Stanford’s Academic Industry Interactions Policies. The case of the drug Neurontin illustrates this point as well-illustrated by C. Seth Landefeld, M.D. and Michael A.

Steinman, M.D. in a case study entitled “*The Neurontin Legacy — Marketing through Misinformation and Manipulation*” that was published in the January 9, 2009 issue of the *New England Journal of Medicine* (see: <http://content.nejm.org/cgi/content/full/360/2/103>). Following the oft-quoted adage that history predicts the future, Pfizer Pharmaceuticals was fined \$2.3 billion this past week for following a similar strategy to inappropriately (and apparently illegally) market their drug Bextra – even after receiving the admonitions for the strategy they pursued for Neurontin. These strategies included enlisting physicians as paid “consultants” and spokespersons for their drugs, enticing them into becoming involved in marketing. And this is not unique to Pfizer since similar strategies were described in early September for Forest Laboratories in their marketing plan for the antidepressant Lexapro. Their marketing strategy also included payments to doctors to induce them to prescribe Lexapro. It is alleged that the Forest Laboratories plan included spending tens of millions of dollars to doctors to give “education lectures” to their peers about Lexapro or to provide “education lunches” as well as CME activities for doctors that included marketing their drug.

These are overt if not flagrant examples of a problem that has become all too pervasive. And I am sure it is not unique to these pharmaceutical industries or these drugs. One can only hope that these practices are becoming past tense – but they do serve as stark reminders of how subtle influences that are financially motivated can have a big impact on physicians, patients and the cost of medicine. They further underscore why our Stanford Industry Interactions Policies are the right thing to do for the profession of medicine now and into the future.

Paying Attention to Professional Compliance

The number of new compliance requirements for which faculty must receive training or whose policies they must adhere to is daunting. Over the years compliance has become one of the major time and resource drains for physicians and scientists as well as institutions. While a case can be made for the importance or validity of each compliance requirement, when viewed in the aggregate they can be a source of frustration. But they are also important in protecting patient safety or the safety of the community in which we work.

Among the many compliance requirements to which we must adhere is that for professional billing integrity. This involves making sure that when a physician bills for a clinical service, she or he does so at the correct level of service complexity (and time allocation) and that this is adequately supported and documented in the patient’s medical record. Some of the regulations that guide professional fee billing are clear and straightforward but others are less clear or self-evident, making it easy to make mistakes in documentation. Two years ago both Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital launched an education and monitoring program related to assessing, monitoring and improving compliance in professional billing. Over this period, the Medical Center Compliance Office formulated a number of education programs and guides which were shared with faculty physicians at the clinical division and department level. Overall, some 1129 physicians participated in this training. Based on this, the office of compliance then audited the medical records of individual providers and gave feedback on an individual level about each physician’s performance. This review constitutes the baseline evaluation and this program has now been completed. Based on this, each physician provider who works at either SHC and/or LPCH has received (or soon will receive) the feedback

for their specific specialty area (by division or department) and their individual performance. With this, the compliance department plans to review additional charts that should reflect the physician provider's knowledge of areas for personal improvement. Since each of us should be striving for being as close to 100% accurate in performance as possible, I want to take this opportunity to remind all physicians to review their individual results and to work with the guidance materials they have received to make further performance improvements. At a time of increased public scrutiny, it is important for each of us as individuals as well as for our institutional performance to be as accurate as possible. Thanks for your work in this important area – and for your continued efforts in the future.

The Year Closes and Opens for Medical Development

Among the many consequences of the economic downturn that began so dramatically in September 2008 is the impact on philanthropy. Over the years we have been blessed to have individuals in our community and beyond who have given generously to support our faculty, students, programs and facilities. Indeed the Stanford we know and love today is a reflection of the gifts we have received from individuals, foundations and corporations. As the economic consequences of the current recession have unfolded, individuals and foundations have lost extraordinary amounts of wealth. And while many have found ways to sustain their gift giving – or to even initiate new ones – we are well aware of how difficult this is given the current times. Indeed, we each know this quite personally since virtually everyone has been touched and impacted by the economic downturn.

Within this context, I provide below our fundraising results for FY09 (which closed on August 31, 2009). I should begin by saying that despite the incredibly volatile and negative economic forces, the School of Medicine has done well in cash received - even when compared to last year (FY08) – which was among the best years on record. This is of course a tribute to the incredible generosity of individuals who care deeply for Stanford and its future. It is also an affirmation of the remarkable work being done by our Office of Medical Development, our many extraordinary community volunteers, led by John Freidenrich, and our faculty and students – who are the reasons why gifts are given for education, research and clinical care. I thank them all.

	FY 09 <i>(September 1 2008 through August 31 2009)</i>		FY 08 <i>(September 1 2007 through August 31 2008)</i>	
	\$\$	# of Gifts	\$\$	# of Gifts
Cash Received	\$129,402,173	8,993	\$141,670,248	9,463
Foundations & Associations	\$56,132,438	1,621	\$46,654,109	1,454
Bequests	\$13,345,140	210	\$26,110,938	76
Corporations	\$14,551,498	624	\$12,074,162	602
Individuals	\$45,373,097	6,538	\$56,831,039	7,331
New Activity	\$140,015,962	8,592	\$225,217,685	9,457

Foundations & Associations	\$66,664,782	1,566	\$53,043,079	1,436
Bequests	\$13,345,140	210	\$26,110,938	76
Corporations	\$15,393,998	619	\$15,821,662	593
Individuals	\$44,612,042	6,197	\$130,242,006	7,352

At the same time I have major concerns for the FY10 fiscal year that began on September 1, 2009. In many ways FY09 success is a reflection of gifts made before the economic downturn. In contrast, the dramatically lower “New Activity” reported in FY09 is a better predictor of current and future pledges and commitments. Most notably, although not surprisingly, is the dramatic fall off in new pledges by individuals in FY09. Of course I remain hopeful that as the economy begins to improve the individuals who have supported us in the past will be in a better position to do so in the future. And, of course, we hope that we will identify new donors who will be excited by our vision and goals and who will invest in our future success. Needless to say we will do all we can to make this happen.

Thanks to Ross Bright, MD

Dr. Ross Bright has served as the Associate Dean for Alumni Affairs for nearly two decades. On September 1st he turned over the reins to Dr. Linda Clever (see: http://deansnewsletter.stanford.edu/archive/06_08_09.html#4) and on Saturday September 12th the Alumni Associations Governing Council honored him for his enormous contributions over so many years of change and opportunity. I also had the opportunity to thank Dr. Bright for his devotion and dedication to our current students, recent and past alumni. He has been a passionate advocate for enriching the engagement and participation of alumni in the School’s mission and he was instrumental in extending the alumni association to embrace graduate students, residents and post-doctoral fellows among the Stanford Alumni. These important contributions are eclipsed by his vision of finding a vehicle to communicate more directly to alumni and to engage their voice in these communications, culminating in the alumni magazine “*Bench and Bedside*” which was his brainchild and which he championed through its inception and the first four issues that have now been published. Indeed *Bench and Bedside* will be a living legacy for alumni – and a reminder of the dedication and commitment of Dr. Ross Bright as Associate Dean for Alumni Affairs. Please join me in thanking and acknowledging Dr. Bright.

Call for Nominations! 2010 Faculty Fellows Program

The Office of Diversity and Leadership has announced the launch of the 2010 School of Medicine *Faculty Fellows Program*. Now entering its fifth year, the program will focus on a select group of Assistant and Associate Professors as Faculty Fellows for the 2009-2010 academic year. The purpose of the Faculty Fellows program is to identify and develop a diverse group of faculty with the potential to become our future leaders.

During the yearlong program, Fellows attend monthly dinner meetings with key University leaders including President John Hennessey, Provost John Etchemendy and Dean Philip Pizzo. Each speaker shares their “Leadership Journey” and engages fellows in a discussion about their leadership philosophy, strategy and style. In addition, Fellows participate in small monthly mentoring groups led by a senior Professor; and in a structured Career Development

Planning process with their division chiefs or department chairs to craft a specific, career development action plan which the fellow will implement over the subsequent year.

If you are interested in being nominated for this opportunity, ask your Department Chair or Chief to nominate you. Criteria to apply:

- Assistant or Associate professors
- Demonstrated interest in, and potential for leadership
- Respected by colleagues
- Has the ability to influence others
- Can advocate for change
- Values diversity
- Thinks strategically and systemically
- Interested in taking on leadership roles in the future

Further information, future meeting dates and application can be obtained at:
http://med.stanford.edu/diversity/leaders/fellows_nominations2010.html

Upcoming Events

Stanford Health Policy Forum on the Key Challenges in Pharmaceutical Regulation will take place on **Wednesday, September 30, 2009, from 11:00 a.m. to 12:30 p.m. at the Clark Center Auditorium**, Stanford University. This forum is free and open to the public. However due to space limitations, we ask that you RSVP online at <http://www.stanfordtickets.org> or call the Stanford Ticket Office at 650-725-2787.

This forum will be a discussion with Donald Kennedy, PhD, President Emeritus of Stanford University and John C. Martin, PhD, Chairman and CEO, Gilead Sciences, and will be moderated by Daniel P. Kessler, Stanford University, focusing on the handling of some of the key challenges in regulating the pharmaceutical industry by the federal government. For information on the Stanford Health Policy Forums, please visit <http://healthpolicyforum.stanford.edu/> or call 650-725-3339.

Stem Cell Policy Symposium: Understanding the Scientific and Legal Challenges Ahead

The Stanford Journal of Law, Science, & Policy presents this public symposium on **Friday, October 2, 2009, from 8 AM to 5 PM at the Stanford Law School**. Dr. **Irving Weissman**, *Professor of Pathology, Director of the Institute of Stem Cell Biology and Regenerative Medicine, Stanford University*, will be the keynote Speaker,

To get more information on the Program and register online to save your spot please go to <http://www.stanford.edu/group/sjlsp>.

To present a poster, please submit abstract to: stemcell.sjlsp@gmail.com

Run for Your Life! Stanford Emergency Medicine 5K/10K Race

Come “Run for Your Life!” on a USATF certified 5K/10K course through the beautiful Stanford campus and help support Stanford Emergency Medicine on **Sunday, October 11, 2009, at 9 am** at Pac-10 Plaza, Stanford University. Fees are: 5K- \$25, 10K- \$35. Register at www.stanfordrunforyourlife.com or by calling Stanford Ticket Office 650.725.2787

Every registered participant will receive a race t-shirt and a water bottle courtesy of Equinox! If you are affiliated with Stanford University Medical Center enter the promo code “SMED” during registration to receive a \$10 discount.

Rather volunteer at the event than run? Email anastasia.stamos@stanford.edu

Stanford School of Medicine's Eighth Annual Fall Forum on Community health and Public Service

On **Tuesday, October 27th, 2009, from 5 – 7 pm** at the Francis C. Arrillaga Alumni Center at 326 Galvez Street, the Fall Forum will celebrate student contributions to community health through public service and community partnership research.

Keynote address by Sergio Aguilar-Gaxiola, MD, PhD, Professor of Internal Medicine, School of Medicine, University of California, Davis and Founding Director of the Center for Reducing Health Disparities at the UC Davis Health System: http://och.stanford.edu/fall_forum.html. The event is free and open to the public.

If you have any questions, please contact Fall Forum coordinators: Dinah Arumainayagam (dinah.arum@gmail.com) and Vinca Chow (vincachow@gmail.com)

Appointments and Promotions

Melissa T. Berhow has been reappointed as Clinical Assistant Professor of Anesthesia, effective 10/16/09.

Lynn Cintron has been appointed as Clinical Assistant Professor (Affiliated) of Anesthesia (Pain), effective 9/01/09.

Ninad Dabadghav has been reappointed as Clinical Associate Professor (Affiliated) of Surgery, effective 9/01/09.

Kay Daniels has been promoted to Clinical Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), effective 9/01/09.

Lyn M. Dos Santos has been reappointed as Clinical Assistant Professor of Pediatrics (General Pediatrics), effective 7/01/09.

Claudia Greco has been appointed Clinical Associate Professor of Pathology, effective 8/16/09.

Michelle C. Holmes has been appointed Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 7/01/09.

Melissa Hurwitz has been promoted to Clinical Associate Professor of Pediatrics (Gastroenterology), effective 9/01/09.

Judith Keddington has been reappointed as Clinical Associate Professor (Affiliated) of Surgery, effective 9/01/09.

Tina T. Lee has been appointed as Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Medicine, effective 8/01/09.

James S. Lin has been appointed Clinical Assistant Professor (Affiliated) of Surgery (Emergency Medicine), effective 7/01/09.

Janice Lowe has been reappointed as Clinical Professor of Pediatrics (General Pediatrics), effective 9/01/09.

Patrick D. Soran has been promoted to Clinical Assistant Professor of Anesthesia (Cardiac Anesthesia), effective 10/01/09.

Scott Sutherland has been promoted to Clinical Assistant Professor of Pediatrics (Nephrology), effective 9/01/09.

Nancy Yuan has been reappointed as Clinical Associate Professor of Pediatrics (Pulmonary Medicine), effective 8/01/09.

Dean's Newsletter

September 28, 2009

Genotyping and Education

Over the last several months a number of our faculty, students and staff have been engaged in discussion and debate about whether to offer personal genotyping to incoming medical students, selected groups of graduate students and incoming residents in internal medicine. Such an offering relates to the emerging field of “personalized medicine” and raises both opportunities and questions of enormous importance, relevance and controversy. It is very much the kind of discussion that should take place at Stanford. But, ironically, the debate, which raged during the summer and was sometimes heated as well as enlightening, began almost by happenstance.

It started on June 5th at the end of a departmental update to the School's Executive Committee when Mark Krasnow, Professor and Chair of the Department of Biochemistry, mentioned, almost in passing, a plan to offer personal genotyping to incoming medical students. At one level, the rationale seems meritorious and obvious. If students elected to be genotyped they would likely become more engaged and personally motivated to understand the underpinnings of molecular genetics and its relevance to the future of medicine. Independently, plans had been made to incorporate personal genotyping into the Advanced Genetics 203 course, and the Department of Medicine had concluded that personal genotyping would enrich the learning experience for incoming residents in Internal Medicine. In fact, these efforts were to have begun this fall.

Numerous faculty leaders, after becoming aware of these plans, began expressing concern – not about the educational value of participatory learning, but about a wide range of ethical conundrums. Some of these are relevant to anyone who elects to undergo personal genotyping. At the same time, the particular vulnerability of students – including the unintended coercion that might result from peer pressure or perceived student perceptions of faculty/teacher expectations – raised additional questions and concerns, which I also shared. Accordingly, within a couple of days after the revelation of the aforementioned plans, I put a temporary moratorium on any plans or proposals to offer genotyping to students and trainees until we had more discussion and debate about the pros and cons, including potential consequences. On June 11th I appointed a Genotyping Task Force to review these broad and important questions.

The Task Force includes Charles Prober (chair), Russ Altman, Clarence Braddock, Pat Brown, Mildred Cho, Gil Chu, Hank Greely, Harry Greenberg, Ralph Horwitz, Louanne Hudgins, Ann James, Stuart Kim, Mark Krasnow, Phil Lavori, David Magnus, Kelly Ormond, John Pringle, Alan Schatzberg and Mike Snyder. This group clearly has broad expertise in genetics (including genetic counseling), basic and clinical science, law, ethics and education. The Task Force first met on June 12th and had a productive and “animated” discussion that addressed the potential benefits and liabilities of offering personal genotyping to students and trainees. One proposal was that this might be done through an “opt-in” approach, but concerns were raised about the need and role of IRB engagement and whether any informed consent could be free of potential coercion, even though unintended.

Issues about how anonymity and confidentiality could be ensured were also raised and, with these, the potential inadvertent impact of the results of student testing on family members. The need for genetic counseling (along with the resources to cover them) was also discussed in relation to news that might affect students who are already under considerable stress by the very nature of their work and study demands. Concerns were also expressed about potential or perceived conflict of interest, since some of our faculty have relationships with the two most notable companies involved with genotyping (e.g., 23&Me [<https://www.23andme.com/>] and Navigenics [<http://www.navigenics.com/>]).

Despite these concerns, the Task Force recognized that it is essential for our students and trainees (and I daresay our faculty as well) to be well informed about this rapidly emerging area of medicine and science. Individuals are already volunteering (and paying for) being tested and a number of faculty have also done so – some being very willing to share their own results

publicly, including in education settings! Because of the importance of preparing students for the future of “personalized medicine” the Task Force considered whether alternatives might be considered at this juncture – such as the use of genomes already available in the public domain or the genotyping of the cadavers used by the students for anatomy. Although there was a diversity of opinion (and still is), Genotyping (genotyping??) most coalesced around a proposal that was presented by Dr. Gil Chu, Professor of Medicine and of Biochemistry.

Dr. Chu’s proposal was discussed with our Executive Committee on Friday, September 18th. Because this is such an important topic, I am interested in engaging our broader community in the dialogue and discussion. In fact, this is an issue that will impact each of us as healthcare providers or healthcare recipients. While the details of Dr. Chu’s proposal are specific, it is also their granularity that helps bring the topic into greater relief.

2009-2010 Proposal for Introducing Students to Genotyping

1. **A three-armed educational approach about the technology and clinical utility and ethical/social implications of genome wide association study data, and whole genome sequencing technologies.**
 - a. ***The Molecular Foundations course (for MD students) will include:***
 - i. Introductory lectures will discuss principles important for understanding genotyping data. Topics include DNA hybridization, nucleic acid amplification, DNA sequencing, and microarrays
 - ii. The course will include an interactive "case presentation" of a sequenced genome, derived from James Watson, Craig Venter, and/or Steven Pinker. The presentation will relate genotyping data to the known phenotype(s), introducing students to the utility, technical feasibility, and ethical implications of the genotyping data.
 - b. ***The Human Genetics course (GENE 202) will provide approximately 4.5 hours of class-time on the clinical utility of genetic association studies and potential clinical utility of genome sequencing as follows:***
 - i. Introductory lectures
 - ii. Lectures about the use of GWAS (Genome Wide Association Studies)
 - iii. Facilitated discussion about the ethics and social implications of such data
 - iv. There will also be a discussion-based lecture about the overall personal, family and social implications of genetic information, particularly predictive information. While not directly targeted to the genotyping education approach, it will also include relevant issues in a case-based format.
 - c. ***Practice of Medicine (POM) course***
 - i. Information about genotyping will be included in the POM course.

Assessment of the process, and of student attitudes towards the potential of genotyping

An appropriate assessment measure will be developed and will be approved by the IRB addressing pre- and post-assessments of knowledge and attitudes of students and trainees about genome wide association data, about the educational process employed this year, about student interest in genotyping, and about the potential implications of use in class (including risks/perception of possible coercion).

The data from the various assessments will be presented to the Genotyping Task Force for review and discussion.

We had a thoughtful and wide-ranging discussion at the Executive Committee, with many points of view and experience offered by clinical and basic science chairs. I encouraged the Executive Committee to reach out to our broader community of faculty and students to also engage them in this discussion, with the understanding that we will be revisiting it in coming months. I am also pleased that our students are wrestling with the issues – and some are writing about it as well. A notable example is the paper of MD/PhD student Keyan Salari (SMS 6) entitled “The Dawning Era of Personalized Medicine Exposes a Gap in Medical Education” in the Student Forum of the August issue of Public Library of Science (see:

<http://www.plosmedicine.org/article/info%3Adoi%2F10.1371%2Fjournal.pmed.1000138>)

Please feel free to convey your thoughts and comments to Dr. Prober (so they can be shared with the Task Force) or directly to me.

Sowing the Seeds of Innovation and Discovery at Stanford

An important question in science is how to promote and support the most innovative and paradigm-changing research. By this I mean research that opens new insights and even shatters past beliefs, creating new ways of looking at the world. This is the kind of research every scientist dreams of doing but relatively few are able to attain. Of course, the reasons are complicated and include everything from true genius to serendipity. It is a matter not simply of research support but also of the very culture of science and the local environment that supports (or occasionally suppresses) individual and even collective creativity and innovation. The dynamics of the process of knowledge creation also play a critical role. New knowledge builds on past discoveries and assumed truths and may progress linearly for long periods, only to erupt from time to time in new bursts of creativity, insight and innovation. This is the history of science described in Thomas Kuhn’s *“The Structure of Scientific Revolutions”* and more recently poignantly described by Steven Johnson in *“The Invention of Air: A Story of Science, Faith, Revolution and the Birth of America.”*

Without question biomedical research in the US is, at least to date, the most advanced and successful in the world. This largely reflects the long-standing and significant investments by the National Institutes of Health in funding basic research as well as the culture of discovery and innovation that has been fostered at our nation’s research universities, medical schools and teaching hospitals. However, while peer-reviewed competitive funding has been a successful model, it does not always foster the most innovative or high-risk research. In fact, when research funding becomes more constrained, as has been the case during the past six years (except for the

current burst of support associated with ARRA funding) investigators often become more cautious and less willing to propose research that is not likely to be successful. Concomitantly, funding agencies and reviewers become more risk adverse in funding proposals that seem to stray too far from pre-existing data.

Several years ago the NIH, to its credit, sought to change this pattern by funding generously a small number of highly competitively selected investigators who posed big and novel, but risky, questions that might be “paradigm shifting” but that not have gotten approved by the traditional peer-reviewed study section system. This led first to the NIH Pioneer Award followed by the New Innovator Award and more recently the Transformative R01 Award. In a sense these research awards represent a small scale but very important (and also prestigious) advance for American science and investigation. When the latest awards were announced by the NIH on September 24th, Stanford faculty once again fared remarkably well: four new Pioneer Awards, five New Innovator Awards and four Transformative RO1 Awards. This is of course wonderful news, and it poses additional interesting questions.

While Stanford is relatively small compared to its peer institutions, it has fared remarkably well in these highly competitive NIH awards for innovation. In fact, Stanford faculty received approximately 10% of this latest round of awards. Even more remarkably, of the 81 NIH Pioneer Awards that have been given since the program began in 2004, Stanford faculty has won 15 (18.5%). How is this continuous pattern of success explained?

I have been reflecting on this question and, while I recognize that my comments are speculative, I want to share them here – since our shared goal is to foster even more creative science – and scientists. Of course, a key factor of success is our remarkable talented individual faculty. But I also think that the environment and culture at Stanford have contributed to their individual and collective success. The seeds of new, creative scientific ideas need fertile soil if they are to flourish. Elements of our “soil” include Stanford’s strengths as well as the culture of Silicon Valley that surrounds and interacts with it. A setting that brings together in close proximity faculty from the engineering, physical, computational and biosciences and that encourages interaction and collaboration is a unique attribute of Stanford. So too is the premium placed on recruiting and then supporting the very best faculty who can be identified and then encouraging them to push their personal limits of inquiry.

An important feature (that I must admit was initially foreign to me when I moved to Stanford from the East Coast) is the view that failure is not an end but a potential beginning. I don’t want to suggest that working at Stanford (like any other premier institution) is not also associated with tremendous pressures and expectations, especially for junior faculty. And this is not to imply that the success of individuals or indeed our institution is a right. That said, I do think that Stanford’s success in garnering a disproportionate share of awards for innovation is a testament to individual ingenuity, strong support and mentoring, the fostering of an entrepreneurial spirit and, of course, a hefty dose of luck. I also think that it reflects the commitment and support of our institutional leaders, especially the President and Provost, the very positive interactions among Stanford’s seven schools and numerous centers and institutes and the support that we receive from our Board of Trustees and community. While it is important to give praise to the individual recipients of these recent awards, they are also tributes to the countless faculty, students and staff

who work with the recipients to create an environment that fosters creativity. We are fortunate that seeds of new ideas and fertile soil in which they can grow are both present in abundance at Stanford.

I end by offering congratulations to each of these new award winners. The details of their awards can be reviewed at <http://med.stanford.edu/ism/2009/september/nih-awards.html>. They include:

NIH Pioneer Awards

- **Ajay Chawla, MD, PhD**, Assistant Professor of Medicine (Endocrinology)
- **Chang-Zheng Chen, PhD**, Assistant Professor of Microbiology and Immunology and member of the Baxter Laboratory in Genetic Pharmacology
- **Markus Covert, PhD**, Assistant Professor of Bioengineering
- **Krishna Shenoy, PhD**, Associate Professor of Electrical Engineering

New Investigator Awards

- **Euan Ashley, MD, PhD**, Assistant Professor of Medicine (Cardiovascular Medicine)
- **Sarah Heilshorn, PhD**, Assistant Professor of Materials Science and Engineering
- **K.C. Huang, PhD**, Assistant Professor of Bioengineering
- **Anna Penn, MD, PhD**, Assistant Professor of Pediatrics (Neonatal and Developmental Medicine)
- **Justin Sonnenburg, PhD**, Assistant Professor of Microbiology and Immunology

Transformative RO1 Awards

- **Andrew Hoffman, MD**, Professor of Medicine (Endocrinology) and Chief of Endocrinology at the VA Palo Alto Health Care System
- **Calvin Kuo, MD, PhD**, Associate Professor of Medicine (Hematology)
- **Julie Parsonnet, MD**, George DeForest Barnett Professor of Medicine (Infectious Disease) and of Health Research and Policy
- **Joseph Wu, MD, PhD**, Assistant Professor of Medicine (Cardiology) and of Radiology

Congratulations to each of the award winners – and also congratulations to Stanford for its partnership with each of them and their colleagues.

Anticipating the Future to Preserve Excellence

How the changing economic environment will affect the core missions of education, research and patient care that define and underpin academic medical centers was the focus of three groups with whom I met in the past two weeks: the Council of Deans of the AAMC (Association of American Medical Colleges), the Board of Directors of the AAHC (Association of Academic Health Centers) and the Group of Principal Business Officers of Medical Schools (part of the AAMC).

Central to the discussions was the fact that education (which serves as the core mission of medical schools) is expensive for both students and institutions. The rising debt (now over

\$175,000) along with the long duration of education (when medical school is combined with residency and fellowship training) is impacting career choice, which in turn is directly affecting our healthcare system. A topic of particular concern was graduate medical education, which, over the next several years, could face some serious challenges in competition for available residency positions as a number of allopathic medical schools have increased class size and new schools have been launched. Not only has there been a failure to fund new ACGME approved residency slots, there is also considerable concern about whether the funding model for GME is sustainable. Currently it is embedded in Medicare, and there is increasing pressure on the Indirect Medical Education (IME) portion of GME funding – which will impact teaching hospitals most severely. At the same time, a number of residency program directors are recognizing that hospital based GME education needs revision so that it has a much greater focus on hospital ambulatory and community based education. Clearly these issues have significant ramifications for programs as we know them. But they are important and deserve consideration.

Coupled with these GME concerns is the reality that the cost of undergraduate medical education needs to be addressed. While I agree that this is important, I feel that this is not simply a cost problem but rather one that needs to focus on a reassessment of the models and formats used for medical education – many of which are carryovers from the 20th century. Thankfully, with the opening of the Li Ka Shing Center for Learning and Knowledge in 2010 we will have the opportunity to critically review the entire scope of our Stanford education programs.

With respect to research, every discussion, needless to say, begins with a focus on funding and the recognition that the last decade has seen more boom and bust economics than any time since the NIH was created. While virtually every school, including Stanford, is benefiting from the 2009 American Recovery & Reinvestment Act (ARRA), appropriate concerns are focusing on the funding for biomedical research in 2011 when ARRA disappears.

The impact of research funding has been experienced quite differently among various medical schools. Many built new facilities and recruited faculty only to find that it was difficult to support a research mission on an on-going basis. This should not really be a surprise since the model for research funding in the biosciences is highly leveraged on sponsored research support along with considerable institutional support. Unfortunately many schools have chased the goal of becoming a top funded school in NIH awards, which has often meant recruiting more faculty than they can support. Thankfully we have not made this mistake at Stanford since our recruitments have been more closely matched to faculty quality (rather than quantity) and our space constraints (while painful) have compelled us to use research space more wisely and to plan new space by more realistic projections of future needs.

At the same time, we do need to critically examine our models for supporting research and to focus on how to better support an excellent but comparatively smaller research faculty than our peers. Importantly, we also need to examine more critically shared costs, especially for cores and functions that support broader communities of investigators and that are critically evaluated for function, effectiveness and cost. At the same time, we need to do all we can to advocate for sustained and predictable funding for biomedical research – an activity that I and many of our faculty leaders are actively pursuing.

The past couple of years have witnessed larger than expected margins in clinical income for physician practices and hospitals. These margins are covering the costs of education and research – as well as physician income and hospital programs (including facilities) at nearly all institutions across the country. While it is hard to predict the pace of change, this issue gives me significant concern. The assumption that payments for physician and hospital services will continue as they have in the past seems highly tenuous. Although it is hard to know the depth and pace of change at this moment, it seems inevitable that downward pressures on reimbursement for physician and hospital services, including GME, are inevitable. I have spoken to some of these issues in a second podcast led by Paul Costello, Executive Director of Communications, and my remarks can be heard at: http://med.stanford.edu/121/2009/pizzo_healthcare.html.

I won't repeat my comments or reflections here – and am first to give them a note of caution under any circumstance – but I do strongly believe that we cannot operate with the assumption that past models of success will carry us into the future. The notion that growth and greater volumes will yield better prices (while still true today) is not likely to be true in the future. Success will be measured more by evidence of quality, effectiveness, efficiency and cost containment along with evidence of innovation and discovery. While we have a long way to go to achieve the metrics of success that will be required in these likely new arenas, I am pleased that the alignments we have developed with our hospital partners at SHC and LPCH are focusing on these very issues. The immediate goal is to stay focused and aligned and recognize that while change is coming we can still play an important role in shaping that change. Without question the issues we will need to address over the next several years will engender internal as well as external debates, will pit one mission and constituency against another, and will compel us to stay focused on our core identity and mission. Stanford will not be spared the challenges that impact every academic center in the nation over the next decade and more, but it can be a leader if we don't lose sight of our mission: *To be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovation in patient care, education and research.*

Stanford's "Mini-Med School" Begins with a Bang

On Tuesday evening, September 22nd we launched the first quarter of our first "*Mini Med School: The Dynamics of Human Health.*" The Fall Quarter of this three quarter course begins with broad overview of science and medicine, from the role of the physician in society to the fundamental underpinnings of life and development to the interactions of humans with the microbes within and the environments outside them – including pandemics– changing healthcare reform and global health. In the Winter and Spring quarters we will continue with "*Medicine, Human Health and the Frontiers of Science,*" which will focus on human biological systems in health and disease.

The first edition of this course has proven amazingly popular. Even though we capped the class size at 250 participants for the first quarter, we are told that the registration for our Mini-Med School is higher than any Continuing Studies course in its 20-year history. This speaks to the interest of our community in topics related to science and medicine and the importance of engaging them in dialogue and education.

I am grateful to the outstanding faculty who have agreed to participate in this course. Our first speaker, Dr. Abraham Verghese, Professor of Medicine and Senior Associate Chair for the Theory and Practice of Medicine in the Department of Medicine, set the bar for excellence high. Dr. Verghese spoke about the role of the physician in past and modern society and also had an engaging dialogue with the participants.

I also want to thank Dr. Kathy Gillam, Senior Advisor to the Dean, for the tremendous amount of time and effort that she has put into the organization of this course.

Clinical Chairs Give Updates to Hospital Directors

It has become a tradition at the September meeting of the Stanford Hospital & Clinics (SHC) Board of Directors meeting to host a dinner event with our clinical department chairs. An important part of this is a brief presentation by each chair about various initiatives and activities going on in their departments. The event held on Wednesday, September 25th was both lovely and informative. The clinical chairs did an excellent job of describing some of the exciting work being conducted in their respective departments and, in doing so, offered a perspective on how broad and deep our clinical programs have become at Stanford Medicine. I know that the Hospital Directors were impressed and I was extremely grateful for all the work that faculty and our chairs are conducting.

Stanford Health Policy Forum – Cancelled

Due to a last minute scheduling conflict, the September 30th Stanford Health Policy Forum has been cancelled. The Forum will be rescheduled for later this fall and a new date will be posted on the Health Policy Forum's website at <http://healthpolicyforum.stanford.edu>.

For any questions or concerns, or to receive an email directly about this reschedule, please contact Lucy Wicks at 650-725-3339 or Lucy.Wicks@stanford.edu.

Upcoming Events

The Ninth Annual Jonathan King Lecture: "Fiction is the Great Lie That Tells the Truth"

Dr. Abraham Verghese, Professor and Senior Associate Chair for the Theory and Practice of Medicine in the Department of Medicine

Tuesday, October 6th

5:00 pm

Clark Center Auditorium

Symposium: "Stem Cells of the Gut and Endoderm"

October 16 & 17

Clark Center Auditorium

This symposium is co-sponsored by the Stanford Digestive Disease Center (DDC – an NIH NIDDK funded interdisciplinary center) and the Stanford Institute for Stem Cell Biology & Regenerative Medicine (SISCBRM). The DDC, under Harry Greenberg as PI/Director, is organizing Part I of the Symposium on Friday, October 16th, while the Institute for Stem Cell Biology is organizing Part II on Oct. 17th. Of note, the second day of the symposia will provide all with a chance to recognize Dr. Irv Weissman, Director of the SISCBRM.

An impressive line-up of invited speakers include Hans Clevers (Hubrecht Institute, The Netherlands); Vassilis Pachnis (National Institute for Medical Research, London); Sean Morrison (University of Michigan); Ken Zaret (University of Pennsylvania); Marcus Grompe (Oregon Health and Science University); Maria Millan (Stem Cells Inc., Palo Alto) along with Stanford faculty including Irv Weissman, Michael Clarke, Calvin Kuo, Seung Kim and Marius Wernig. If you are interested in attending the symposium please RSVP to lpjacob@stanford.edu.

Honors and Awards

Stanford Hospital & Clinics presented two awards to faculty: one for clinical excellence and the second for compassion in medicine. I am pleased to announce the award recipients:

- ***Dr. Christine Wijman***, Associate Professor of Neurology and Neurosciences and Director, Stanford Neurocritical Care Program received the Denise O’Leary Award for Clinical Excellence
- ***Dr. Stephanie Harman***, Director, Palliative Care Inpatient Consult Service and Instructor in Medicine received the Isaac Stein Award for Compassion in Medicine.

Please join me in congratulating Drs. Wijman and Harman

Dean’s Newsletter October 12, 2009

Supporting a Role in Science and Medicine

The Stanford Cancer Center held its Third Annual Comprehensive Cancer Research Training Program from September 28th - October 2nd (see: http://cancer.stanford.edu/features/research_news/documents/2009CCRTPRegistrationBrochureFORM.pdf), during which I addressed the challenges of supporting a career in science and medicine from the perspectives of the individual, the institution and society. Although my comments were directed at education and training for careers in clinical oncology, cancer biology and related disciplines, most of which take place in Academic Medical Centers (AMCs), they can also be extended to other academic disciplines in medicine and science.

I reviewed the history of AMCs during the 20th century and their significant growth since the introduction of Medicare and research support from the NIH. Together, these developments resulted in a more than ten-fold increase in the number of faculty along with the expansion of medical schools and AMCs. While these centers have been enormously productive and are envied throughout the world as centers for education and research as well as for advances in patient care, they are also highly dependent on funding sources that are subject to swings driven by the marketplace as well as the politics surrounding state and federal expenditures. Witness, for example, the growth of the national research enterprise when the NIH budget doubled between 1998-2003, to its contraction when the NIH budget increases were below inflation from 2003-2009, to its current (albeit likely temporary) relief due to the \$10.4 billion allocated to the NIH through the American Recovery and Reinvestment Act (ARRA) of 2009.

These rapid changes have consequences on the career plans and development of those training to be clinicians, physician-scientists and scientists, as opportunities emerge or seem to vanish. The history of research is influenced by the curiosity and interests of investigators as well as the funds available to support their work. It is not an accident that stem cell biology and regenerative medicine are so robust in California, where the \$3 billion approved for stem cell research in 2004 by Prop 71 have had such an enormous impact on the career choices of both new and seasoned investigators.

Changing economic forces as well as perceptions of career security can have profound impacts on newly minted MDs and PhDs. For decades there has been concern about the future of physician-scientists and scholars. Indeed, the high water mark for physician-scientists is truly past, having peaked in 1985 at 23,000 (or 4.6% of the MD workforce) to approximately 14,000 (or 1.4%) in 2004. Just staying even requires the entry of approximately 500 new physician-scientists each year. The challenge is even more pronounced due to the fact that the average age of the physician-scientist workforce is now 51 and the average age of the first RO1 grant is 42. While we have made progress in increasing the number of women physician-scientists, it is unfortunately also the case that attrition among women is higher – reflecting a multitude of individual, family and societal factors. Among the major issues impacting the decision to pursue a career as physician-scientist is the uncertainty of stable research and institutional support – which is accentuated by the noted shifts and changes in external funding.

These issues are of particular interest and concern to Stanford since our primary goal is to educate and train future physicians and scientists who are committed to scholarship and careers in academia. Indeed, career development is of great interest to our faculty, departments and the school – as well as our students and trainees. This was the topic of our Leadership Retreat in 2009 and will be a primary feature of our efforts over the next year(s). That said, the challenges are notable for both individuals and institutions. These concerns featured prominently in my comments to our trainees pursuing careers in clinical oncology and cancer research.

The first step for an individual is to define the type of career one wishes to pursue. For MDs the opportunities include career paths that are largely in patient care or more exclusively in research, or some combination of the two. For PhD graduates the opportunities are largely in academia or in industry. Ultimate career satisfaction for any individual rests on staying true to one's primary

passion – whether as a physician or a scientist. Each has a range of positive and negative attributes, and one's career is optimized by determining the path of greatest personal interest and not one driven by the expectations of mentors, colleagues or institutions or even by the personal economic awards or compromises. Of course, each of these factors does play a role in individual choice – but it is critical to own one's choice and not to feel molded or coerced by an institutional culture or expectation(s). At the same time, it is imperative to determine whether the institution is truly supportive of the career choice one is making.

A career as a clinician-educator (with the preponderance of one's time in direct patient care) or, at the other extreme, as a full-time investigator, brings with it the least ambiguous set of definitions, boundaries and expectations. A career as a physician-scientist, in contrast, is much more challenging, since the pushes and pulls of patient care demands are not infrequently pitted against those for academic development. This tension makes the institutional culture and support all the more important. The very opportunities to translate knowledge from the laboratory to the patient can be squandered or lost depending on the culture and priorities of institutions and their leaders.

Institutional culture is also hard to define, in part because it consists of numerous and variegated microcosms. Indeed, it might be said that there are at least four institutional cultures on our own campus – one for the university outside of the medical school, another for the medical school (which differs among and between basic and clinical science departments), a third at Stanford Hospital & Clinics and a fourth at Lucile Packard Children's Hospital. Further confounding this complexity is the variation in the perceived value and support for a career path as a clinician-educator, clinician-scholar/scientist, or investigator.

In addition to defining the type of career one wishes to pursue, individuals should obtain a clear understanding of the tangible institutional support available for their personal and professional development. Evidence for this begins with the resources allocated to launch one's career (which is highly dependent on the nature of the work being done) as well as the potential for long term support to sustain a career over time. For clinician-scientists this includes support for protected time to pursue academic development, a sufficient amount of time to achieve measurable success for promotion and retention (including tenure or continuing appointment), and a range of benefits and resources to support personal as well as professional development. Coupled with these is evidence of a robust mentoring program as well as workshops and resources that define and clarify the metrics for success in career development. Support programs to assist in childcare, eldercare, family and medical leave are also important. While by no means perfect, the programs in place at Stanford or those being introduced provide strong evidence of institutional support (see: http://deansnewsletter.stanford.edu/archive/07_27_09.html#1). These programs can certainly be further enhanced and improved, but even what exists now is designed to foster success – especially when there is a match between an individual's career choice and institutional expectations and support. When these are not aligned, opportunities for success, and especially career satisfaction, quickly become compromised.

Even when individual and institutional goals, expectations and support are aligned, societal commitments and support can alter the equation of success and satisfaction. As I have noted previously, this can be dramatically impacted by external sources of funding for research or

payments and expectations for clinical care and service. The future success of clinician-educators in academic medical centers will be influenced both positively and negatively by healthcare reform. In different ways, the success of scientists and physician-scientists will be affected by the nation's commitment to research – which for the NIH will be recast during FY11 when ARRA funding has been spent. This includes not only the total amount of research support but also the support for new and transitional investigators. Here a refinement of the “K-awards,” particularly to provide more salary support, is critical. So too is further expansion of the R29 program and, especially, the transition from K awards to R01 grants.

This transition is the area of greatest vulnerability, and attrition in the physician-scientist ranks occurs if the chasm from a K to an R award is not bridged. For both MDs and PhDs the next vulnerability comes about if R01 funding is not renewed or additional grant support not secured. These transitions are further accentuated by the competition for federal support between new and established investigators. An additional confounding factor in the present economic climate is that a number of the private research foundations that have traditionally complemented or supplemented public support have had to reduce or dramatically curtail awards because of the loss of endowment or gift opportunities.

While many of these issues are not new, there is no denying that they are more acute during times of uncertainty and constraints on resources - such as those we face today. This is why institutional commitment and support are so important – along with informed decisions by individuals. Despite the uncertainties, a career in academic medicine – as an investigator, clinician-scholar or clinician-educator – is enormously rewarding and fulfilling. While I have no doubt that we will need to make compromises and adjustments in the years ahead as individuals, institutions and as a society, I am also convinced that if we hold true to our vision and goals we can sustain and enhance the career development of future generations – for their sake and for our communities locally and globally.

Influenza Vaccine for Healthcare Providers

Most of you have received the seasonal influenza vaccine by now – which is important. Within the next weeks H1N1 immunizations will become available. As I described in the September 14th Newsletter (see: http://deansnewsletter.stanford.edu/archive/09_14_09.html#1), given the risks for widespread infection, it is imperative that all medical providers do everything possible to prevent the spread of H1N1. This includes infection control policies (i.e., handwashing, masks, appropriate isolation) and vaccination. Except for those with an allergy to eggs or a prior history of Guillan-Barre syndrome, it is imperative that all healthcare providers receive the H1N1 vaccination. The Medical Executive Committee for Stanford Hospital & Clinics and the Lucile Packard Children's Hospital will almost surely adopt this imperative, and it should be viewed as policy for all faculty, students and staff in the School of Medicine who are involved in patient contact.

As of October 9th 37 states are reporting widespread influenza, virtually all of which is H1N1. While the good news is that the morbidity and mortality related to H1N1 has not been greater than seasonal flu, it is important to underscore that we are still in the early days of this infection, and the opportunities for change in the profile or severity of this novel infection remain a

concern. Accordingly, our best response is prevention (which includes vaccination and infection control practices) as well as antiviral treatment of high-risk groups (pregnant women, infants and children, those > 65 years of age and individuals receiving immunosuppressive therapy) along with chemoprophylaxis for healthcare providers who are exposed to infection. With the imminent availability of the H1N1 vaccine, be sure to get vaccinated if you have any patient care activities. Updates on vaccine availability as well as other important information on influenza will be posted on the Stanford Emergency Preparedness website – see: <http://stanfordmedicine.org/flu/index.html>.

Stanford and Industry Relations

As most of you know, during the past several years we have established a number of governing principles, guidelines and policies regarding relationships with industry. These are codified on our website at <http://med.stanford.edu/coi/siip/>. While we seek ways to develop collaborative and productive relationships with industry, we want to avoid interactions that create overt or subtle influences or that engage Stanford directly or even inadvertently in marketing for industry. Our policies have been modeled by many other institutions, are consistent with or acknowledged by the Institute of Medicine (IOM) and Association of American Medical Colleges (AAMC) and graded “A” by the American Medical Student Association (AMSA). And while compliance is quite excellent (and much appreciated) there have been a couple of recent examples where faculty, primarily from basic science departments, proposed or planned education or training programs that could have led to violations of our policies had they not been discovered and corrected. These recent experiences prompt me to remind you about these policies and to encourage you to review them directly or the FAQs sheet that accompanies them (see: <http://med.stanford.edu/coi/siip/faqs.html>). Thank you.

The Role of Academic Health Centers in Workforce Planning During Healthcare Reform

Once again progress in national healthcare reform seems more likely, although its scope and depth await further debate and reconciliation between the Senate and House of Representatives. This seems slated to take place during the next weeks to months, although it should be expected that the full dimensions of reform will likely take years to unfold. We hope for changes that eventually lower healthcare costs, improve access as well as the quality of care and reverse some of the perverse incentives that have guided the medical marketplace. At the same time it must also be anticipated that virtually every sector (doctors, hospitals, insurance companies, the pharmaceutical and device industry, consumers and many others) will experience negative as well as (hopefully) positive impacts from the changes that place – even though many will be take years to be fully appreciated.

Because of their higher costs and multiple missions, which include education and research as well as patient care, academic medical centers (AMCs) are particularly vulnerable. Even though AMCs and teaching hospitals train physicians, nurses, dentists, pharmacists and other healthcare providers, and conduct basic and clinical research, they are rarely mentioned or featured prominently in the discussions and debates on healthcare reform. Although a number of professional societies and organizations have offered opinions to state and federal legislators as well as the Executive Branch, it is not clear that a consistent message is being delivered. Given

the complexity of the issues and the interests of the multiple constituencies that comprise an AMC this is hardly surprising. But it is not necessarily helpful.

The AAMC and AAHC have been among the organizations that have been highlighting the unique role and importance of AMCs. I have taken part in a number of these discussions, and on October 6th I participated in a congressional briefing on this topic. One of the key messages we delivered is that academic medical centers are critically important to our nation's future precisely because they are at the intersection of education, research and patient care. However, these missions are expensive and interconnected, and two of them (education and research) require institutional support to supplement the shortfalls from tuition or research grants and contracts. Because of their not-for-profit status, AMCs have supported education and research with funds received from the public sources (for state schools and universities), from gifts or endowment and from clinical income.

Given the economic downturn, public support has been severely contracted for nearly all state institutions, and gifts and endowment income have been dramatically diminished – and will likely remain so for years to come. This has made the dependency on support from clinical income, generated largely at teaching hospitals, more critical to many AMCs. At the same time, a report released by the AAMC on October 8th demonstrates how important AMCs are to the local and national economy. In the aggregate 131 medical schools and nearly 400 teaching hospitals are reported to have had an economic impact of over \$512 billion on state and national economies. The report notes that AMCs employ 1.86 million individuals and are directly or indirectly responsible for approximately 3.3 million full time jobs across the nation (for full report see:

https://services.aamc.org/publications/index.cfm?fuseaction=Product.displayForm&prd_id=268&prv_id=329).

Though there is wide recognition and support for cost containment as part of health care reform, reimbursement reforms need to take into account the collateral impact that could affect the sustainability of academic health centers. Among the concerns is support for graduate medical education (including the need to expand the number of Accreditation Council for Graduate Medical Education [ACGME] approved residency slots) through changes in Medicare. This has specific ramifications for defining the future healthcare provider workforce.

It is frequently noted that the ratio of primary care to specialty physicians is skewed toward specialists in the United States compared to other resource rich nations. Current efforts to increase the number of physicians graduating from medical school will not address this successfully unless there are changes in the opportunities and benefits for a career as a generalist (e.g., internist, pediatrician, family physician) – including compensation as well as perceived and real career satisfaction. In the current system these are often seen as disincentives, impacting also the geographic distribution of the physician workforce in both urban and rural settings. While many argue that the need for primary care providers mandates training more physicians, this should not be viewed as the sole solution. In many ways, the health and care needs of communities would be better served by teams of providers that include doctors, nurses and others trained to provide preventive and general care in addition to high-end and chronic care. Unfortunately, creating this balance is unlikely to take place in a rational way when various

providers and professional groups focus on their self-interests compared to the needs of the communities they should serve.

Because AMCs train the entire range of healthcare providers, they should play a more prominent role in orchestrating team-based education, training and care models. With that in mind, the AAHC has argued that too little attention is being paid to comprehensive workforce reform as an essential ingredient of healthcare reform. I agree, although this is also somewhat of a chicken and egg phenomenon – namely, the needed workforce will also be defined by the nature of the future healthcare system itself. That said, in our congressional briefing (as well as other meetings that have been held), we argued for a health workforce planning body to address the nation's urgent health workforce needs in a comprehensive and coordinated manner. This should be an integral part of healthcare reform.

Fall Issue of Stanford Magazine is out

I am pleased to let you know that the fall issue of the *Stanford Medicine* magazine is now available. This issue offers several timely stories, among them three tales of modern medical detection. Readers follow physician-scientists, the experts at solving medicine mysteries, as they use technologies to turn up clues unimagined in writer Arthur Conan Doyle's day – a telltale quirk in a gene's sequence, for example, or a peculiar hormonal secretion. The issue is available both online at <http://stanmed.stanford.edu> and in print (650 736-0297). For additional information, please contact Susan Ipaktchian at (650) 725 --5375 (susani@stanford.edu), or M.A. Malone at (650)723-6912 (mamalone@stanford.edu) or email medmag@stanford.edu.

Upcoming Event

Symposium: "Fetal Cardiac Intervention"

Thursday, November 5th

9:00 am - 3:00 pm

Freidenrich Auditorium, Lucile Packard Children's Hospital

Open to the public

This symposium will be led by Drs. Mike Longaker, Dan Bernstein and Frank Hanley. Keynote addresses will be given by Drs. Mike Harrison from UCSF and Deepak Srivastava from the Gladstone Institute. For more information, contact Subia Ahmad at (650) 736-1829; subia.ahmad@lpch.org or Lindsay Okamoto at (650) 497-8160; lindsay.okamoto@opsch.org.

Awards and Honors

- **Dr. Harry Greenberg**, Senior Associate Dean, Research and Training and the Joseph D. Grant Professor in the School of Medicine, will be this year's medical honoree at the American Liver Foundation (ALF) Salute to Excellence Awards Gala in March of 2010, in recognition of his many contributions to molecular virology and hepatitis. The ALF honors those who have made an outstanding contribution to biotechnology or medical innovation. Congratulations, Dr. Greenberg.

- **2009 McCormick Faculty Awardees:** The School of Medicine and the Office of Diversity and Leadership are pleased to announce the recipients of the 2009 McCormick Awards. These awards provide research/project funding to junior faculty women pursuing advancement, or to junior faculty men or women who support the advancement of women in medicine and/or medical research. This year's McCormick Award winners include:
 - **Claudia Mueller**, MD, PhD, Assistant Professor, Department of Surgery
 - **Kim Rhoads**, MD, Assistant Professor, Department of Surgery
 - **Erika Schillinger**, MD, Clinical Associate Professor, Department of Medicine, Family and Community Medicine

Congratulations to each.

- **Dr. Carla Shatz**, Professor of Biology and Neurology, is this year's recipient of The Mika Salpeter Lifetime Achievement Award. This award, which recognizes an individual with outstanding career achievements in neuroscience who has also significantly promoted the professional advancement of women in neuroscience, will be given on October 19th at the Annual Society for Neuroscience Meeting. Congratulations, Dr. Shatz.

Appointments and Promotions

Maja Artandi has been promoted to Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/09..

Kim D. A. Bullock has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 9/01/09.

Annette Chavez has been reappointed as Clinical Associate Professor (Affiliated) of Surgery, effective 9/01/09.

Susan Frayne has been reappointed to Associate Professor of Medicine at the Veterans Affairs Palo Alto Health Care System, effective 9/01/09.

Susan Galel has been reappointed to Associate Professor of Pathology at the Stanford University Medical Center, effective 9/01/09.

Gill Harcharan has been reappointed to Associate Professor of Urology at the Stanford University Medical Center, effective 9/01/09.

Kimberly Hill has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 9/01/09.

Peter H. Hwang has been promoted to Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 9/01/09.

Kathleen Kenny has been reappointed as Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/09.

Seung Kim has been promoted to Professor of Developmental Biology, effective 9/01/09.

James Lau has been appointed as Clinical Associate Professor of Surgery (General Surgery), effective 8/01/09.

Jason T. Lee has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 9/01/09.

Marc B. Lee has been promoted to Clinical Assistant Professor of Neurosurgery, effective 9/01/09.

Bryant Lin has been promoted to Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/09.

Kristine H. Luce has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 9/01/09.

Jeffrey A. Norton has been reappointed to Robert L. and Mary Ellenburg Professor in Surgery effective 9/01/09.

David Peng has been appointed as Clinical Associate Professor of Dermatology, effective January 1, 2010.

Rita Popat has been reappointed as Clinical Assistant Professor of Health Research and Policy, effective 9/01/09.

Zakia Rahman has been reappointed as Clinical Assistant Professor (Affiliated) of Dermatology, effective July 1, 2009.

Lisa Shieh was promoted to Clinical Associate Professor of Medicine (General Internal Medicine), effective 9/01/09.

Michael Snyder has been appointed to Professor of Genetics, effective 9/01/09.

Susan M. Swetter has been promoted to Professor of Dermatology at the Veterans Affairs Palo Alto Health Care System and at the Stanford University Medical Center, effective 9/01/09.

Ian Tong has been promoted to Clinical Assistant Professor of Medicine (General Internal Medicine), effective 9/01/09.

Mytilee Vemuri has been promoted to Clinical Assistant Professor of Psychiatry and Behavioral Sciences (Behavioral Medicine), effective 8/01/09.

Joanna Wysocka has been reappointed to Assistant Professor of Chemical and Systems Biology and of Developmental Biology, effective 9/01/09.

Dean's Newsletter

October 26, 2009

Learning and Knowledge from the East and the West

During the past week I have had the chance to view the Li Ka Shing Center for Learning and Knowledge (LKSC) from several perspectives. On October 16th, the LKSC Executive Committee reviewed the latest updates on construction, and I had the opportunity to tour the facility (including the impressive newly planted palm trees that lead from Campus Drive to the entrance) and review progress on the Foundations and Academic Walks, which comprise the accompanying art and history project that will integrate our new medical campus. I also reviewed updated plans with student leaders.

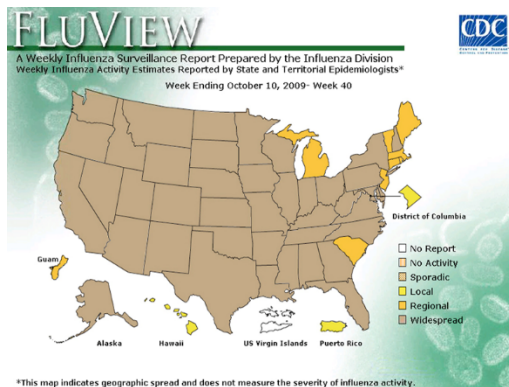

Then, on October 23rd, I met in Hong Kong with Mr. Li Ka Shing to thank him for the gift that will help transform Stanford Medicine. The LKSC is moving rapidly toward completion (see <http://lksc.stanford.edu/>) and will begin hosting selected events in the spring of 2010. We currently anticipate a phased move-in, beginning in March 2010 and extending through the summer. It will be ready for the opening of classes next August, and I am confident that it will more than live up to our hopes of creating a state-of-the-art center for education and learning that also serves as the front door to the medical school. With its completion Stanford Medicine will be the beneficiary of wonderful new resources for students and trainees.

Between the October 16th meeting of LKSC Executive Committee and the October 23rd visit with Mr. Li, I also had the opportunity to visit Shantou University in southern China as well as the Li Ka Shing Medical Faculty of the Hong Kong University. I was joined in the visits by Drs. Charles Prober, Senior Associate Dean for Medical Student Education, and David Gaba, Associate Dean for Immersive and Simulation-Based Learning. We had the opportunity to engage in a dialogue about approaches to medical education and about how the LKSC will contribute to global learning – particularly at Shantou University. As part of our East West Alliance and as an extension of the Stanford Challenge, these evolving global partnerships open new doors for shared learning as well as the generation of new knowledge.

Status on H1N1

H1N1, which now accounts for nearly all cases of flu in the USA, is widespread across 41 states, including California. Of note, the proportion of deaths attributed to pneumonia and influenza has increased and exceeds what is normally expected at this time of year (see CDC figures below). Of particular concern, deaths among children are increasing, even in those without antecedent illness or risk factors. According to the CDC, there have been 86 confirmed pediatric 2009

H1N1 deaths since April; 39 of these have been reported to CDC since August 30, 2009. While the H1N1 nasal spray has

Reported influenza like illnesses

arrived in California, the inactivated vaccine is still not available, although it is expected soon (see: <http://www.cdph.ca.gov/HealthInfo/discond/Pages/H1N1Vaccine.aspx>). As noted in earlier communications, several high risk groups have been identified who should be immunized as soon as the vaccine is available, including:

- Pregnant women
- Persons who live with or provide care for infants aged <6 months (e.g., parents, siblings, and daycare providers)
- Health-care and emergency medical services personnel. As noted in prior communications, the Medical Executive Committees at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital have determined that all medical staff and Advanced Practice Practitioners must be immunized to seasonal influenza and H1N1 unless there is a severe allergy to eggs, prior history of Guillan-Barre syndrome or certain other neuro-degenerative disorders. Failure to comply will result in suspension of medical privileges. Members who feel they have any other compelling reason for exemption should contact the Chief of Staff directly. Dr. Bryan Bohman, Chief of Staff, commented this policy in his October 23rd memorandum to the SHC Medical Staff entitled "Mandatory Flu Vaccination Policy Announcement."
- Persons aged 6 months through 24 years (note that children age 6 months – 9 years should receive two doses of the H1N1 vaccine. Children over 10 years of age should receive one dose)
- Persons aged 25 through 64 years who have medical conditions that put them at higher risk for influenza-related complications
- While persons over 65 should receive the vaccine, they are not included by CDC in the initial risk group (unless they have co-morbidities) since they are generally expected to have milder disease because of prior exposure and pre-existing antibody to H1N1.

For individuals diagnosed with H1N1, early antiviral intervention with oseltamivir (Tamiflu®) or zanamivir (Relenza®) is important for high-risk groups including:

- Children younger than 2 years old
- Persons aged 65 years or older
- Pregnant women and women up to 2 weeks postpartum (including following pregnancy loss)
- Persons of any age with certain chronic medical or immunosuppressive conditions
- Persons younger than 19 years of age who are receiving long-term aspirin therapy

It is important to remember that we are still very early in the flu-season and that the trends now being observed are concerning – mandating that we do all we can to prevent and treat infection as carefully and well as possible.

Review of the Stanford NCI Cancer Center is Underway

On Thursday, October 15th, more than 30 physicians and scientists from across the nation participated as site visitors in the review of Stanford's 3-year renewal as an NCI designated Cancer Center (see: <http://cancer.stanford.edu/>). Following many months of preparation and weeks of rehearsals, the site visit team listened to reports and updates from leading Stanford faculty about the research and clinical advances that have transpired in the three years since Stanford first achieved designation by the NCI in 2006.

In addition to thanking each of these Stanford leaders I want to specifically acknowledge Dr. Beverly Mitchell, George E. Becker Professor in Medicine and Professor, by courtesy, of Chemical and Systems Biology and Director of the Stanford Cancer Center. Since first joining Stanford as Deputy Director of the Cancer Center and, since August 2008, as Director (http://deansnewsletter.stanford.edu/archive/07_07_08.html#2), Dr. Mitchell has done an outstanding job in leading and directing the Cancer Center. She has worked tirelessly to assemble an outstanding team, create a community of excellence and cancer focus, and bring Stanford to ever higher levels of excellence in cancer-related education, research, patient care, advocacy and community service. Her many contributions were clearly evident during the NCI site visit. I know she has won the respect and confidence of everyone who has worked with her – and I want to add my thanks and appreciation as well.

NIH Director Interviewed by Paul Costello

Paul Costello, Executive Director of Communications and Public Affairs at the School of Medicine, recently interviewed Francis Collins, MD, PhD, who was confirmed and sworn in as Director of the NIH in August 2009. The interview is in the “1:2:1” research and policy podcast series conducted by Paul. The interview with Dr. Collins is timely given the concerns about the level of NIH funding we might see following the end of the ARRA (American Recovery and Reinvestment Act), which will become reality with the FY11 budget. Dr. Collins addresses the NIH budget, his priorities and more in his interview, which is at: <http://med.stanford.edu/121/2009/collins.html> .

2010 Employee of the Year Spirit Awards

In April 2010, the School of Medicine will again award Annual Employee of the Year SPIRIT Awards to two exceptional staff members. The winners will be selected based on outstanding performance, which includes dedication, initiative, motivation, positive attitude and customer service. Staff members must have outstanding performance and have been employed as regular employees, at 50% FTE or more, in one department/unit for the past 2 years. Nominations opened on Monday, October 12th. A special web site has been set up at <http://med.stanford.edu/SPIRIT/>. Please submit your nomination for the person you think should win the SPIRIT Award.

Celebrating Stem Research – and Irv Weissman – at Stanford

Since it was founded at the end of 2002, the Stanford Institute for Stem Cell Biology and Regenerative Medicine has become recognized around the world as one of the leading centers of excellence in this rapidly advancing field. Fueled by support from the California Institute of Regenerative Medicine (CIRM) and soon to be housed in the Lorry Lokey Stem Cell Research Building (Stanford Institutes of Medicine I), the success of the Institute is the work of remarkable faculty and leadership. Among these is Irv Weissman, who has served as Director since the Institute was founded and who, together with an incredible group of colleagues, has made incredible scientific advances that are literally creating new fields of stem cell biology – including areas that have a close association with cancer.

Stem cell biology took a pause recently to recognize and celebrate the 70th birthday of Irv Weissman in a symposium held on Saturday, October 17th. Leaders in stem cell biology and related disciplines traveled from around the world to share ideas, data and celebratory comments and reminiscences about Irv. He has had an integral relationship with Stanford for nearly 50 years, and Irv has helped to shape not only new fields of science but also the medical school that has been so closely aligned with his life and work. Stanford and Irv have a hand in glove relationship, and his reach has encompassed education, research, patient care, mentoring, leadership, good friendship (varyingly mixed with fly fishing, wine and [often unhealthy] food) – with fascinating insights and deep dedication. It was with fondness and great respect that I had the opportunity to join a chorus of Irv admirers from multiple generations of family, friends and colleagues to say thanks for all he has done and continues to do – and, of course, Happy 70th. We hope this will be a new beginning for Irv and Stanford.

Senior Faculty Transitions

On October 23rd, the Association of American Medical Colleges (AAMC) published an update on faculty age profiles at US medical schools during the past 40 years (from 1967-2007). During this time period, the overall number of faculty has increased from 17,584 to 119,018. Interestingly, the average age of faculty has risen from 41.4 in 1967, to 44.7 in 1987 to 48.5 in 2007 (the last year for which there is complete data). Similarly, the percentage of faculty over 55 years of age increased from 9% in 1967 to 19% in 1987 to 29% in 2007. These findings are consistent with my recent comments on the increasing age of first NIH awards (<http://deansnewsletter.stanford.edu/#1>).

There are, of course, multiple ways of viewing these data. On one hand, it is good news that faculty are able to sustain longer productive careers. On the other hand, it is important to consider the implications of a larger number of more senior faculty retiring over a short time period, especially as this would affect the faculty workforce. Regardless, it is important to seek ways to support the career development and longevity of senior as well as junior faculty. This is something we have taken to heart at Stanford with the work of the Senior Transitions Task Force that was led by Dr. Gary Schoolnik (see: http://deansnewsletter.stanford.edu/archive/08_25_08.html#4) which resulted in a website containing information we hope is helpful to our faculty (see: <http://med.stanford.edu/academicaffairs/senior-faculty/>). The AAMC report reminded me to reacquaint you with the information resources the Task Force assembled.

Congratulation to New Members of the Institute Of Medicine

The Institute of Medicine (IOM) of the National Academy of Sciences named 65 new members and five foreign associates on October 12th. Election to IOM is widely considered one of the highest honors in medicine and health and recognizes individuals who demonstrated outstanding achievements. The IOM was established in 1970 and is recognized as a national resource for “independent, scientifically informed analysis and recommendations on health issues.”

Among the 65 new members are five current Stanford Medical School faculty. These include:

Russ Altman, MD, PhD, Professor and Chair, Department of Bioengineering, and Professor of Genetics, Medicine, and Computer Science

Patrick Brown, MD, PhD, Investigator, Howard Hughes Medical Institute; and Professor, Department of Biochemistry

Michael L. Cleary, MD, Lindhard Family Professor in Pediatric Cancer Biology, Departments of Pathology and Pediatrics

Allan L. Reiss, MD, Howard C. Robbins Professor, Department of Psychiatry and Behavioral Sciences, and Director, Center for Interdisciplinary Brain Sciences Research

Lawrence Steinman, M.D., Professor of Neurology, Pediatrics, and Genetics, Department of Neurology and Neurological Sciences

The new members join the 57 existing Stanford faculty who are Members of the IOM. Congratulations to all!

Awards and Honors

- ***Scott Delp, PhD***, Professor of Bioengineering and of Mechanical Engineering, and, by courtesy, of Orthopaedic Surgery, and co-director of the Stanford Center for Biomedical Computation, has been appointed as an initial holder of the James H. Clark Professorship

in the School of Engineering. The James H. Clark Fund for Bioengineering was established in 1999 to support bioengineering faculty generally, and was previously used to support new faculty in starting up their labs. This is the first time that the fund will be used to support two endowed Professorships; the other is Jim Swartz. Congratulations to Dr. Delp.

- **Tom Krummel**, the Emile Holman Professor and chair of the Department of Surgery, was recently installed as the President of the Halsted Society for the 2010 Society year. This is one of the oldest and most prestigious surgical organizations in the country whose purpose is to further the scientific principles and ideals; to encourage exchange of ideas, free and informal discussion, and a spirit of sociability and good fellowship among its members. Congratulations Dr. Krummel.
- **David Stevenson**, Vice Dean and Senior Associate Dean for Academic Affairs, the Harold K. Faber Professor of Pediatrics and Professor, by courtesy, of Obstetrics and Gynecology, is the 2009 Hewlett Award Recipient and his grand rounds will take place on November 4th titled: "Targeted Chemoprevention of Neonatal Jaundice: Personalizing Medicine for Babies." Congratulations Dr. Stevenson.

Upcoming Event

Stanford School of Medicine's Eighth Annual Fall Forum on Community Health & Public Service

Tuesday, October 27th

5:30 – 7:30 pm

Frances C. Arrillaga Alumni Center (326 Galvez Street)

Keynote address by *Winston F Wong, MD, MS*, Medical Director for Kaiser Community Benefit and a former Medical Director at Asian Health Services in Oakland. Keynote Title: "Resuscitating the Body Politic." More information can be found at: http://och.stanford.edu/fall_forum.html

Please mark your calendar and plan to join us as we celebrate student contributions to community health through public service and community partnership research. The event is free and open to the public. If you have any questions, please contact Fall Forum coordinators: Dinah Arumainayagam (dinah.arum@gmail.com) and Vinca Chow (vincachow@gmail.com).

Appointments and Promotions

- **Sanjeev Dutta** has been promoted to Associate Professor of Surgery and of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 10/01/09.

- **Michael Kaplan** has been reappointed to Professor of Otolaryngology – Head and Neck Surgery and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 10/01/09.
- **Lawrence Recht** has been reappointed to Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, at the Stanford University Medical Center, effective 10/01/09.

Dean's Newsletter November 9, 2009

Public Disclosure of Industry Relationships

Earlier this year, Stanford School of Medicine became one of the first medical schools in the country to adopt a policy of public disclosure of financial relations of faculty with industry. We felt it was important for faculty to have as honest and transparent relations with students, colleagues, patients and the public we serve as possible. Accordingly, we extended our 2006 Stanford Industry Interactions Policy to include public disclosure on the School of Medicine's website of all industry interactions that exceed \$5000 per year beginning in late August of 2009 (see: http://deansnewsletter.stanford.edu/archive/03_30_09.html#6) and http://deansnewsletter.stanford.edu/archive/08_31_09.html#5).

As I have also discussed in prior issues of the *Dean's Newsletter* (see: http://deansnewsletter.stanford.edu/archive/03_30_09.html#6), Senator Charles Grassley (R-IO) has introduced legislation entitled "The Physician Sunshine Act" that would require the pharmaceutical and device industries to publicly disclose payments to physicians for consulting, lecturing, etc. In anticipation of the legislation, a number of industries have begun websites making such disclosures. The November 5th *New York Times* (<http://www.nytimes.com/2009/11/04/health/policy/04sunshineside.html>) reported the names of individuals who received the highest quarterly payments from Eli Lilly. Included in the list was an Adjunct Clinical Instructor in Stanford Department of Psychiatry and Behavioral Sciences. The inclusion of this individual attracted considerable media coverage and, at least for me, was a surprise. Let me begin by saying that I am extremely appreciative of the time, knowledge and expertise our ACF faculty provide to our students, trainees and community. And we are grateful that they do this *pro bono*. In turn we are pleased to extend a Stanford title to those who fulfill the criteria for appointment to the ACF (see: <http://med.stanford.edu/academicaffairs/acf/>).

Recognizing that our ACF colleagues are almost always in full-time clinical practice and that their Stanford teaching responsibilities constitute a small percentage of their time, we have tried to respect the boundaries of their Stanford responsibilities. Accordingly we have limited our policies on industry relations and conflict of interest (see: <http://med.stanford.edu/coi/siip/>) to their official Stanford responsibilities. But the recently reported situation raises the question of whether such a compartmentalization is feasible or achievable. That is, once a Stanford title is bestowed, it is hard for the public (including industry) to distinguish whether a physician is acting on her or his own or in a Stanford capacity.

Accordingly, I have appointed a Task Force to examine how our Industry Interactions Policy and conflict of interest disclosure policies (including public disclosure) should apply to Adjunct Clinical Faculty. It is likely that the vast majority of ACF have little to no industry relations. But it should not be forgotten that recent surveys have indicated that approximately 94% of physicians (including those in clinical practice) receive gifts or payments from industry. And, in the case of the ACF individual reported by Eli Lilly, the amount of payment was considerable. While I am not passing a judgment on a specific case or individual, I do think it is important that we acknowledge that any person with a Stanford faculty title (including ACF) bears responsibility for how the title is used and how relationships with industry are performed and disclosed. I will have more to report on this in a few weeks.

Education versus Marketing: Use of Stanford Facilities for Promotional Videos

Over the past several weeks a number of questions have been raised about the appropriate use of Stanford's space, name and trademarks to promote commercial and business interests of outside third parties. Stanford's resources exist to support the University's missions of the creation, preservation and dissemination of knowledge. The use of Stanford's name to imply support for an outside business entity or by inference the endorsement of a product or service has the potential of distorting the University's primary teaching and research mission and is not permissible.

Several administrative policies detail specific guidelines concerning the use of Stanford's name, space (which includes the use of Stanford University Medical Center services or facilities) and trademarks. I urge you to refer to these policies in the Stanford Administrative Guide (see below) should you have any questions about participating in a video for an outside business interest.

For additional counsel on this issue, you can contact Paul Costello, Executive Director of Communication and Public Affairs at Paul.Costello@Stanford.edu. The relevant policies are: <http://adminguide.stanford.edu/14.pdf> and http://adminguide.stanford.edu/15_5.pdf.

Stem Cell Biology and Regenerative Medicine

Since its inception in 2003, the Stanford Institute for Stem Cell Biology and Regenerative Medicine has continued to develop in stature and achievement. Building on the fundamental discoveries in stem cell biology that have been made by Stanford faculty and their colleagues, a new phase of research is emerging in the form of proposals and plans to translate important discoveries from the bench to the bedside. These efforts begin with a compelling idea and engage interdisciplinary teams of investigators at Stanford and collaborating institutions around the world. To foster the translation of science into clinical practice, unique relations with industry and with the FDA will also be needed. To facilitate this new phase of research, the California Institute of Regenerative Medicine (CIRM) has taken the bold step of providing major financial support (up to \$20 million per project) for competitive proposals by "disease teams" ready to

make progress toward initiation of a clinical trial within 48 months after the start of the funding. Clearly this is a major commitment for CIRM as well as for the disease teams, and it brings with it considerable and important shared expectations and accountability.

At the October 28th meeting of the ICOC (the governing board for CIRM, of which I am a member), Stanford faculty proved highly successful in the competition for “disease team” funding. Indeed, of the fourteen disease teams that were approved by the ICOC (of course I had to recuse myself from any consideration of the Stanford applications), three faculty were approved as Principal Investigators (PI) and one as a Co-PI. This is a remarkable achievement in its own right, although it is also consistent with the success of Stanford faculty in past CIRM competitions.

The Stanford disease teams include projects in leukemia, stroke and the dermatologic disorder dystrophic epidermolysis bullosa (see also: <http://med.stanford.edu/ism/2009/october/cirm.html>). Other CIRM funded disease teams will address potential stem cell treatments for HIV/AIDS, sickle cell disease, brain tumors and solid tumors, diabetes, macular degeneration, cardiomyopathy, and amyotrophic lateral sclerosis. Many different approaches and technologies are employed and the assembled teams include collaborators from the USA, Canada, and the UK. The Stanford led disease teams are:

- ***Principal Investigator Al Lane***, Professor and Chair of Dermatology (with Anthony Oro and Marius Wernig as Co-PIs) “*iPS Cell Based Treatment of Dominant Dystrophic Epidermolysis Bullosa*”
- ***Principal Investigator Gary Steinberg***, Professor and Chair of Neurosurgery (with Stanley Carmichael of UCLA as Co-PI) “*Embryonic-Derived Neural Stem Cells for Treatment of Motor Sequelae Following Sub-cortical Stroke*”
- ***Principal Investigator Irv Weissman***, Professor of Pathology and of Developmental Biology and Director of the Institute for Stem Cell Biology and Regenerative Medicine (Ravindra Majeti and Bev Mitchell as Co-PIs) “*Development of Therapeutic Antibodies Targeting Human Acute Myeloid Leukemia Stem Cells*”
- ***Co-Principal Investigator Gary Nolan***, Professor of Microbiology and Immunology (with Dennis Slamon of UCLA as Principal Investigator and Michael Press of USC as Co-PI) “*Therapeutic Opportunities to Target Tumor Initiating Cells in Solid Tumors*”

The funding is tracked to the PI and, based on that, Stanford will receive \$51.7 million. With these new awards, Stanford has received 42 of the 321 grants awarded by CIRM – which translates into a total of \$162,979,744. This is the largest amount of CIRM funding of any institution in California – which now totals \$1.01 billion. This is an incredible contribution by the citizens of California (through Prop 71, which created CIRM) to support stem cell research. Clearly the next several years will be tremendously exciting scientifically.

In addition to support from California and CIRM for stem cell and regenerative medicine research, several Stanford faculty were also successful in receiving major awards from the

National Heart, Lung, and Blood Institute (NHLBI), one of the National Institutes of Health, for pioneering stem cell research. They are:

- **John Cooke**, Professor of Medicine, and Alan Friedman of Johns Hopkins University will focus on the safe reprogramming and differentiation of adult cells to blood-forming cell lines for eventual application to blood or vascular disorders.
- **Robert Robbins**, Professor and Chair of Cardiothoracic Surgery and Director of the Cardiovascular Institute, and Deepak Srivastava of the J. David Gladstone Institutes, San Francisco, plan to produce usable and reliable induced pluripotent stem cells that can be used for cell therapy in the heart.
- **Mark Krasnow and Irving Weissman** will focus on identifying and characterizing progenitor cells involved in healthy lung and blood development that ultimately may be used in addressing disease or injured states.

Taken all together, Stanford's programs in stem cell biology and regenerative medicine are moving forward with remarkable vigor and results. These efforts will also be more tangibly visible when the Lorry Lokey Building for Stem Cell Research (a.k.a. the Stanford Institutes of Medicine I) opens in the summer of 2010.

Dr. Emmanuel Mignot is Appointed Director of the newly created Stanford Sleep Center

Thanks to the pioneering work of Dr. William Dement, Stanford has long been seen as a leading center in sleep medicine – and in many ways the architect of the field. The program has been anchored in the Department of Psychiatry and Behavioral Sciences and has made major contributions to the science of sleep and its disorders as well as significant advances in the diagnosis and treatment of sleep disorders. Of note, in February of 2009, a state-of-the-art Sleep Center opened at the new Redwood City Ambulatory Center that is owned and operated by Stanford Hospital & Clinics.

Over the years the science and medicine related to sleep has evolved, matured and become more interdisciplinary. Accordingly, a Task Force led by Dr. David Stevenson and Dr. Kathy Gillam was appointed in 2008 to examine the best models and organizational structure to sustain and enhance the excellence of the sleep research and clinical programs at Stanford. While a number of models were proposed, we ultimately settled on establishing the Stanford Center for Sleep Sciences and Medicine (SCSSM). In doing so, we recognized that the optimal starting point was a “hybrid model” that anchored the new Center in the Department of Psychiatry while also permitting it to reach out and collaborate with other departments and disciplines in the medical school and university.

To foster the interdisciplinary focus of the SCSSM, it was determined that the director would report to the Dean (or Vice Dean) and that there would be a Steering Committee of department chairs and hospital administrators involved in sleep related activities. The goal of the SCSSM will be to “engage the broad Stanford community in research, education and patient care in sleep medicine.” It was also determined that the leader of the SCSSM would be appointed by the Chair of the Department of Psychiatry as the Chief of the Division of Sleep Medicine, thus aligning the

Center and Division as a organizational unit that is located administratively in the Department of Psychiatry while also serving as an interdepartmental Center that serves the broader community.

I am very pleased to announce that Dr. Emmanuel Mignot has accepted my offer to become the first Director of the SCSSM. Concurrently, Dr. Alan Schatzberg has appointed Dr. Mignot Chief of the Division of Sleep Medicine in the Department of Psychiatry. Dr. Mignot is the Craig Reynolds Professor of Sleep Medicine and is internationally recognized for his pioneering research in narcolepsy and other sleep disorders. He has received numerous awards and honors and is an elected Member of the Institute of Medicine of the National Academy of Institutes. I join Dr. Schatzberg in being extremely pleased that Dr. Mignot will lead our new Center for Sleep Science and Medicine.

Evolving Agenda in Clinical and Translational Research

On Friday, October 30th the Spectrum Strategic Advisory Board met to review the progress of Stanford's Clinical and Translational Science Award (CTSA). Stanford is one of 46 institutions across the USA that has received an NIH CTSA award. These awards are designed to assist medical centers to develop a transformative home for clinical and translational science through innovation, education and the optimization of resources. Stanford's CTSA, also known as Spectrum, receives \$5 million annually from the NIH (and an additional \$3M from the School and University). It is unique in being anchored in the broader university and in its efforts to reach out to the Schools of Engineering, Humanities & Sciences, Business, Law, Education and Earth Science – as well as to the interdisciplinary Institutes on the Environment and on Human Health and to community initiatives, both locally and globally.

Stanford's Clinical and Translational Research Unit (<http://sccter.stanford.edu/>) has sought to bring together adult and pediatric programs (under the banner of Spectrum Child Health: <http://spectrumchildhealth.stanford.edu/>) and to create the infrastructure for clinical research, including regulatory and compliance functions as well as the panoply of requirements (e.g., core facilities, clinical trials budgeting, informatics and statistics support) that enable effective and optimized clinical research. One of the important objectives of Stanford's CTU is to forge connections with industry and development partners through SPARK (led by Dr. Daria Mochly-Rosen) and the Biodesign Program (led by Dr. Paul Yock). The Stanford CTU also helps foster novel research through pilot funding programs and has also developed unique Stanford connections – such as between the medical school and the Stanford Synchrotron Radiation Laboratory (SSRL) at SLAC to enhance drug discovery.

The Stanford CTR has also been building education and training programs designed to develop future physician-scientists and scholars as well as to prime the pipeline for diversity and excellence. These include programs that enrich science learning for high school students in addition to leadership and community training for faculty and trainees. In tandem are an increasing number of efforts to develop community programs and interactions – both locally and globally.

During our Spectrum Advisory Meeting we had excellent updates on each of these initiatives and I was very pleased by the progress being made in our overall clinical and translational research

efforts. I am particularly grateful to Dr. Harry Greenberg, the PI for our CTSA and Director of Spectrum, as well as the Co-Directors Drs. Phil Lavori, Charles Prober, Brandy Sikic and David Stevenson. While this is very much of a work in progress, it is clearly gaining momentum and excellence. Thanks to all – and especially our faculty, students and trainees.

NIH Director's Major Initiatives

During the November 5th Board Meeting of the Foundation for the NIH, Francis Collins, newly appointed NIH Director, outlined five of his major priorities. These include:

1. ***The application of new technology to understanding how life works and goes wrong.*** He referred to big science projects like expanded genomics and imaging that might catalogue “all proteins and all genes” and how they are related to normal and abnormal life processes.
2. ***Translating basic science discoveries into new and better treatments.*** He referenced improving the pipeline for discoveries and innovations and specifically commented on high throughput technologies and chemical genomics and the TREND project.
3. ***Putting science to work for the benefit of health care reform,*** including the use of evidence based medicine, quality outcomes research, pharmacogenomics and the use of mobile technologies to monitor and improve health outcomes.
4. ***Encouraging a greater focus on global health,*** including communicable and non-communicable diseases and also neglected tropical diseases.
5. ***Reinvigorating and empowering the biomedical research community,*** including focusing on the pipeline for new biomedical scientists as well as the funding to support bioscience research.

While these themes are important, they are largely about more big science initiatives and did not focus on basic research as a primary underpinning. I would hope that future presentations would offer a greater attention to basic research as an underpinning to translational research and medicine.

Laptop Security and Encryption

I brought to your attention in a past Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/04_07_08.html) the critical issues of laptop security, privacy of information and the need for encryption. At the Executive Committee meeting on Friday, November 6th, Todd Ferris, Associate CIO – IT Services, and Ellen Amsel, Director, Information Security Services, provided an update on these topics. They reminded us that if identifiable patient or research subject health information is stored on a laptop or any other removable media (e.g., USB drive, CD, portable hard drive), that information must be encrypted (Stanford University Data Classification: http://www.stanford.edu/group/security/securecomputing/dataclass_chart.html), and they provided the following information:

Stanford's central IT organization, ITS, has funded PGP, which is encryption software that is compatible with both PCs and Macs. PGP is available to everyone at Stanford at no cost. ITS is providing 24/7 support for PGP, and each user can have up to three licenses for use on three different computers. Information on PGP can be found at: <http://www.stanford.edu/services/encryption/wholedisk/index.html>. We strongly encourage the use of PGP (or other encryption tool) and remind you that current, reliable backups of your data are always important. If your laptop is stolen, even if it is encrypted, you will need a copy of your data so you can continue your work. Backups, of course, should also be properly protected. Additional information can be found at the School of Medicine website: http://irt.stanford.edu/security/encryption_main.html.

Contact your local IT support person to help you with PGP or another encryption solution that best fits your needs. You can also contact the School of Medicine Service Desk at 725-8000. In the event of a lost or stolen laptop, contact the School of Medicine Privacy Officer at 725-1825. There is a presentation that contains all of this information and more at: <http://med.stanford.edu/irt/security/protecting/EncryptionPresentation>.

I urge you to take the necessary steps to assure that you are in compliance with this important policy.

Opportunities to Help Our Neighbors

The Dean's Office is excited to rally in aid of our community and run a food & fund drive to benefit Second Harvest Food Bank of Santa Clara and San Mateo Counties. Most of us know someone who is struggling to make ends meet, and we have the opportunity to ensure that no child, family or senior goes hungry. Through your generosity we can provide hope for the 207,000 people Second Harvest feeds each month. Please join us in this effort to feed our neighbors who, each month, have to decide between paying for rent, utilities, or medicine and providing food for their loved ones.

Drop off food donations in the barrels located in the Dean's office, Alway building, M-121. Please note the most needed foods:

- *Meals in a can (Stew, Chili, and Soup)*
- *Peanut Butter*
- *Cans with pop top lids*
- *100% Fruit Juices*
- *Canned Fruits*
- *Canned Vegetables*
- *Tuna/Canned Meat*
- *Low-Sugar Cereal*

The Dean's Office will be collecting donations until **Friday, December 18**.

In addition, the Dean's Office is holding a coat drive over the next few weeks. Coats of all shapes and sizes are welcome. Just bring your clean, gently used coats and jackets to the Dean's Office between **November 9 and December 4**. In conjunction with the One Warm Coat organization, all reusable coats will be distributed free of charge directly to local people in need.

Thank you in advance for your participation!

Upcoming Event

National Health Forum:

New Responsibilities for Scientists, Clinicians and Policy Makers

Thursday, November 18

4:00 – 5:30 pm

Byers Auditorium, Genetech Hall, UCSF Mission Bay Campus

On Thursday November 18th the Institute of Medicine of the National Academy of Sciences will sponsor a regional meeting to which all are welcome. The meeting will be moderated by Dr. Bernie Lo, Professor of Medicine and Director of the Program in Medical Ethics at UCSF, and will feature presentations by Drs. Susan Fisher (UCSF), Sandra Hernandez (The San Francisco Foundation and Board Member at LPCH) and Ralph Horwitz, Chair of Medicine at Stanford. Registration is at www.iom.edu/sfregional.

Awards and Honors

- **Dr. Alan Garber**, Stanford Health Policy Director, has been awarded the Society for Medical Decision Making's Career Achievement Award. Presented at the SMDM annual conference, the award recognizes senior investigators who have made significant contributions to the field of medical decision making.
- **Dr. Lucy Shapiro**, Ludwig Professor of Developmental Biology, will be 2010 recipient of the Abbott Lifetime Achievement Award, the highest honor bestowed by the American Society of Microbiology.
- **Dr. David Stevenson**, Harold Faber Professor of Pediatrics, Vice Dean and Senior Associate Dean for Academic Affairs, received the 2009 Albion Walter Hewlett Award from the Department of Medicine. This award honors "an extraordinary physician in the Stanford community...who has consistently, over decades, demonstrated the exemplary combination of a scientific approach to medicine and compassionate patient care." Dr. Stevenson is the 21st recipient of the Hewlett Award.

- The Academic Council of Stanford University has elected four School of Medicine faculty members to serve on the Advisory Board. The Provost has offered his commendations to each and I share their names with you:
 - **Dr. Ben Barres**, Professor and Chair of the Department of Neurobiology
 - **Dr. Linda Boxer**, Professor of Medicine and Chief of the Division of Hematology, Department of Medicine
 - **Dr. Dr. John Boothroyd**, Professor of Microbiology and Immunology and Associate Vice-Provost for Graduate Education
 - **Dr. Steve Galli**, Mary Hewitt Loveless Professor and Chair, Department of Pathology
- **Yi-Ren Chen**, SMS, has been selected to participate in the 8th Annual Paul Ambrose Scholars Program – one of only 44 medical students across the nation to be selected for this program.

2009 CTSA Seed Grant Awardees: The Office of Community Health is pleased to announce the recipients of the 2009 CTSA Seed Grants. These awards provide research/project funding for Stanford faculty to form new community-based partnerships, enhance existing partnerships or support implementation of a community-based research project with community-based organizations in San Mateo or Santa Clara counties. This year's award recipients include:

- **Lisa Chamberlain**, M.D., MPH , Assistant Professor of Pediatrics and **Meg Itoh**, M.D., Pediatric Resident, Lucile Packard Children's Hospital for: Understanding the Lives and Health Needs of Refugee Foster Care Youth in Santa Clara County
- **Halsted R. Holman**, M.D. , Professor of Medicine, Emeritus for: Improving Care for Chronic Disease through a Community Partnership
- **Samuel So**, M.D., FACS, Director, The Asian Liver Center at Stanford University for: Studying the Efficacy of Education and Community Center Vaccination and Screening Services to Reduce Chronic Hepatitis B
- **Dee West**, Ph.D. Professor, Department of Health Research and Policy and **Bang Nguyen**, Dr.PH , Consulting Assistant Professor, Department of Health Research Policy for: Building Community Academic Partnerships for Cancer Control Research
- **Eunice Rodriguez**, Dr.PH , Associate Professor, Department of Pediatrics and Center for Education in Family and Community Medicine and **Nancy Morioka-Douglas**, M.D., MPH, Clinic Professor, Clinic Chief, Stanford Family and Community Medicine for: Refining and Disseminating HealthyU: A Health Science Learning Journey
- **Michaela Kiernan**, Ph.D. Senior Research Scientist, Stanford Prevention Research Center for: Translation of Group-Based Behavioral Obesity Treatments to Extend Community Reach

Appointments and Promotions

Elias N. Aboujaoude has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/01/09.

Euan A. Ashley has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 12/01/09.

Rashmi Bhandari has been reappointed as Clinical Assistant Professor of Anesthesia (Pediatric Anesthesia), effective 11/01/09.

Richard J. Bloom has been reappointed as Clinical Associate Professor (Affiliated) of Surgery, effective 9/01/09.

Carlos Bustamante has been appointed to Professor of Genetics, effective 1/01/10.

Manish J. Butte has been appointed to Assistant Professor of Pediatrics, effective 11/01/09.

Emilie V. Cheung has been reappointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 12/01/09.

Ramsey Cheung has been promoted to Professor of Medicine at the Veterans Affairs Palo Alto Health Care System effective 11/01/09.

Ronald Cohen has been reappointed as Clinical Professor of Pediatrics (Neonatal and Developmental Medicine), effective 6/01/09.

Todd Dray has been reappointed as Clinical Assistant Professor (Affiliated) of Otolaryngology – Head and Neck Surgery, effective 9/01/09.

Ting-Ting Huang has been promoted to Associate Professor (Research) of Neurology and Neurological Sciences, effective 11/01/09.

James I. Huddleston has been reappointed to Assistant Professor of Orthopaedic Surgery at the Stanford University Medical Center, effective 12/01/09.

Peter J. Koltai has been reappointed to Professor of Otolaryngology – Head and Neck Surgery at the Stanford University Medical Center, effective 11/01/09.

Ware Kuschner has been reappointed to Associate Professor of Medicine at the Veterans Affairs Palo Alto Health Care System, , effective 11/01/09.

Ralph S. Lachman has been appointed as Clinical Professor of Radiology, effective 10/01/09.

Julie Livingston has been promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Brian J. Feldman has been appointed to Assistant Professor of Pediatrics , effective 11/01/09.

Sandra Luna-Fineman has been appointed as Clinical Associate Professor of Pediatrics (Hematology and Oncology), effective 1/21/10.

Daphne Ly has been appointed as Clinical Assistant Professor (Affiliated) of Surgery (General Surgery), effective 8/01/09.

Lawrence McGlynn has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 9/01/09.

Ashraf I. Osman has been appointed as Clinical Assistant Professor of Cardiothoracic Surgery, effective 1/01/10.

Cheryl Pan has been reappointed as Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Krystle Q. Pham has been promoted to Clinical Assistant Professor (Affiliated) of Obstetrics and Gynecology, effective 9/01/09.

Claude Rogé has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics (Pediatric Cardiology), effective 9/01/09.

Jonathan R. Strayer has been appointed as Clinical Associate Professor of Neurosurgery, effective 11/01/09.

Jesse Tannenbaum has been reappointed as Clinical Assistant Professor (Affiliated) of Pediatrics, effective 9/01/09.

Fan Yang has been appointed to Assistant Professor of Orthopaedic Surgery and of Bioengineering, effective 11/01/09.

Dean's Newsletter

November 23, 2009

2009 Summit On Clinical Excellence

On November 19th the Stanford University Medical Center held its third annual Summit on Clinical Excellence. Sponsored by the School of Medicine, the Stanford Hospital & Clinics and

the Lucile Packard Children's Hospital, this year's Summit focused on communications, teamwork and the ever increasing challenge of "hand-offs" in the clinical setting. Bryan Bohman, Chief of Staff at SHC, serving as the course director and moderator, did an excellent job in both capacities.

In my opinion, this was the best of the Clinical Summits to date, largely because it engaged a broad array of SUMC faculty and staff in its planning and leadership. One of the most striking and important features was the transparency and honesty about what is working at SUMC and, importantly, what is not working. Indeed the Summit began with a recitation of failures or near misses in clinical excellence and reflected a willingness on the part of our community to acknowledge our failings as a way to make future improvements.

It is clear that SUMC has made significant strides in quality excellence over the past three years. But it is also abundantly clear that much work remains – and, importantly, that continued efforts are needed to prevent backsliding. All faculty and staff must embrace a commitment to quality excellence. It is also clear that these efforts need support and commitment by institutional leaders. This was evident at the Summit by the attendance and comments from members of the SHC and LPCH Board of Directors, including Mariann Byerwalter, Chair of the SHC Board of Directors, and John Lillie, Chair of the LPCH Board of Directors. CEOs Martha Marsh (SHC) and Chris Dawes (LPCH) also expressed their support to quality excellence. I offered my support as well and underscored that a commitment to excellence in the quality and excellence of patient care needs to be as embedded and embraced as is our very evident commitment to excellence in research. Creating a better balance of our missions at Stanford was a topic I addressed in some detail in my February 17, 2009 Newsletter (see: http://deansnewsletter.stanford.edu/archive/02_17_09.html#2c).

In addition to excellent presentations by Clarence Braddock, Professor of Medicine and Medical Director for Quality at SHC, and Christy Sandborg, LPCH Chief of Staff, the Summit featured a presentation by Dr. Allan Frankel from the Institute for Healthcare Improvement and Division of General Medicine at the Brigham & Women's Hospital in Boston on the critical role that communication plays in promoting or reducing errors. He demonstrated how critical teamwork is and showed how much the value of teams differs in the healthcare field compared to the airline industry, which has put a premium on teamwork and error reduction through communications, checklists and a culture that makes everyone responsible for assuring safety. In medicine this will require rebasing the traditional hierarchical order of medical practice to one that empowers all providers to engage in the identification and elimination of potential safety or quality errors without a fear of retribution or retaliation. To do this there needs to be interplay between the attributes of leaders, the norms of conduct of teams and the focus on improvement in the units responsible for safe, effective and quality driven patient care. Among the characteristics are:

Attributes of Leaders	Norm of Conduct of Teams	Improvements Sought by Units
<i>Ensure Respect</i>	<i>Plan Forward</i>	<i>Continuously Test</i>
<i>Ensure Psychological Safety</i>	<i>Reflect Backward</i>	<i>Relentlessly Seek to Improve</i>
<i>Set Expectations</i>	<i>Communicate Clearly</i>	

	<i>Resolve Conflicts</i>	
--	---------------------------------	--

Improving communication among clinical teams at SHC and LPCH was an action item at the Summit. Multidisciplinary teams of physicians, nurses, and other healthcare professionals met in small groups to develop specific action plans addressing some of the most challenging areas of communication. The efforts they began at the Summit will be followed-up in the months ahead as their plans are further developed and then implemented.

Summits and retreats are helpful in bringing diverse communities together to share knowledge and experience and to develop plans for the future. They are successful if the plans are further developed and then brought to fruition. Clearly this is the challenge and the goal. But there can be no doubt that the November 17th Summit for Clinical Excellence highlighted important issues and created a forum for assuring clinical excellence.

Faculty Forward: School of Medicine Job Satisfaction Survey

One of my overarching priorities is to foster a workplace that is valued by our faculty, students and staff. There is no doubting that the pressures of an academic medical center are significant – especially during periods of constraint such as those as we have experienced in recent times. Nonetheless it is important that we continuously strive to do more to support our community and, periodically, assess how we are performing and what further might be done at the division, department or school-wide level. In 2007 Stanford participated in a pilot project of the AAMC and the Collaborative on Academic Careers in Higher Education (COACHE). I reported on the results of that survey in the February 17, 2009 Dean’s Newsletter (see: http://deansnewsletter.stanford.edu/archive/02_17_09.html#2b).

In April 2009, Stanford was one of 23 medical schools that participated in the next phase of the Faculty Forward COACHE project. In this survey, locally coordinated by Dr. Hannah Valantine, Senior Associate Dean for Diversity and Leadership, we asked all faculty to participate (Investigators, Clinician Scholars/Investigators, Clinician Educators). Surveys were sent to 1,061 individuals, and responses were received from 467 (44%), including 54 (45.4%) of the 119 basic science faculty and 413 (43.8%) of clinical faculty. A disproportionate percentage of women (180/325 or 55.4%) compared to men (287/736 – 39.0%) responded.

Responses were grouped into nine themes, including the nature of the work; climate, culture, collegiality; collaboration/mentoring/feedback; promotion; compensation/benefits; recruitment and retention; governance and operations; clinical practice and global satisfaction. The data was presented in various ways, including peer and cohort comparisons, areas of strength and weakness and gender or minority status. In this update I want to share the categories in which Stanford was ranked first or second out of five in a peer group comparison and in the top half of the overall cohort. I think it is best to consider these results as global trends, although there is similarity to the earlier survey, giving this update some added strength. Here are the data in the aforementioned categories by strength and then weakness.

Areas of Strength (Top of the Group)

1. Nature of Work

- a. Value placed on research/scholarship at the medical school, department and division levels
- 2. *Climate, Culture, Collegiality***
 - a. The intellectual vitality of departments
 - b. That work is appreciated by patients, students and residents
 - c. The culture of the medical school in cultivating interdisciplinary work, entrepreneurialism and excellence
- 3. *Collaboration/Mentoring/Feedback***
 - a. Opportunities to collaborate with faculty in other departments in the medical school and with faculty in other schools at the university
- 4. *Promotion***
 - a. The criteria for promotion around research and scholarship are clear
 - b. The opportunities for professional development at the medical school level
- 5. *Compensation/Benefits***
 - a. Positively seen (compared to peers) are housing benefits, tuition benefits, assistance with spousal hiring, parental leave, availability and the quality of childcare
- 6. *Recruitment and Retention***
 - a. The medical school is seen as successful in hiring high quality faculty members – as are departments and divisions
 - b. Similarly, the school, departments and divisions are seen as successful in retaining high quality faculty members
 - c. Success is seen in retaining female faculty members
- 7. *Governance and Operations***
 - a. Positively seen are communications from the dean’s office to the faculty about the medical school – including explaining overall finances to the faculty
 - b. Also ranked high are the dean’s priorities for the medical school and the pace of decision making at the school and department level
 - c. Faculty feel they can express their opinions about the medical school without fear of retribution
- 8. *Global Satisfaction***
 - a. The department and medical school as a place to work
 - b. “If I had it to all over again, I would again choose to work at this medical school”
 - c. “If I had it do all over again, I would choose an academic career”

Areas of Potential Weakness (areas ranked low in comparison to peers and the entire cohort)

- 1. *Nature of Work***
 - a. The number of hours worked in an average week and the control that one has over one’s schedule
 - b. The value the medical school and department (as well as the department chair and division chief) place on teaching, patient care, community service, administration
- 2. *Climate, Culture, Collegiality***
 - a. How well one “fits” (a sense of belonging) in one’s department
 - b. The quality of personal interactions with departmental colleagues

- c. Respect of departmental colleagues of “my efforts to balance work and home responsibilities”
 - d. The faculty in my department get along well together
 - e. My work is appreciated by my immediate supervisor
 - f. The workplace culture fosters collegiality or opportunities to all faculty regardless of race/ethnicity
- 3. Collaboration/Mentoring/Feedback**
- a. Usefulness and frequency from unit head on career performance
- 4. Promotion**
- a. Criteria for promotion based on teaching, patient care, institutional service
 - b. Female and male faculty have equal opportunities for promotion rank.
 - c. Minority and non-minority faculty have equal opportunities for promotion in rank
- 5. Compensation/Benefits**
- a. Salary, health benefits and retirement benefits
- 6. Governance & Operations**
- a. The availability and quality of research space
 - b. The equity in distribution of research space among faculty
 - c. “My department does a good job explaining departmental finances to faculty”
 - d. Availability of administrative support to do one’s job
- 7. Clinical Practice**
- a. Support from administrative or office staff for ones clinical care activities
 - b. Opportunities for physician input in management decisions

In a number of important ways, the results of the most recent survey mirror those of others we have conducted over the years. It is true (and appreciated) that we have made progress in closing some of the gaps in gender disparity. However, with respect to our core missions, we still have a culture where contributions to patient care and education do not appear to be as highly valued as are contributions to research. I have previously discussed this and won’t recite all the reasons this belief arose and why it continues to be fostered. And I do want to underscore that I too value contributions to research as a core value. That said, I also view contributions to education and patient care as equally important to the overall success of our medical school and medical center. In reviewing the data in more detail, I note that it appears that some of the perceptions that contributions to patient care and education are of less value than research contributions are arising at the department and division level. It is important for leaders and faculty throughout the school to foster a better sense that excellence in contributions in all of our missions contribute equally to our overall success.

Perceptions of what is valued are within our control and, just as we need to cultivate an environment that fosters excellence in quality in patient care (see above), so too do we need to foster a sense of balance and quality across all of our missions – another topic I have focused on in past Newsletters (see: http://deansnewsletter.stanford.edu/archive/02_11_08.html#b) since this was also the topic of our 2008 Leadership Retreat. Career development and faculty support will also be an important ongoing initiative and a major topic for review at our 2010 Leadership Retreat.

Supporting the Research Mission in Academic Medical Centers

At the recent Association of American Medical Colleges (AAMC) meeting I chaired a session about how medical centers are preparing for changes in the support for research in the years ahead. There can be no doubt that the USA has excelled in biomedical research during the last half of the 20th century and the beginning of the 21st, largely through sponsored federal research support from agencies like the National Institutes of Health (NIH), the National Science Foundation (NSF) and, in defined areas, the Departments of Energy and Defense, among others. This support led to the rapid growth of academic medical centers across the USA, evidenced by a more than tenfold increase in the size of faculty and the expansion of research facilities (some much more than others) at virtually every academic medical center.

Despite a research budget just above \$30 billion for the NIH in 2009 (not counting stimulus support from the *American Recovery and Reinvestment Act of 2009* [ARRA]), the competition for research support is significant and, even when successful and fully funded, institutions need to invest considerable additional resources from other sources in order to support a mission in research. The amounts and sources of cross-subsidization for research vary among institutions and generally include clinical income, gifts, endowment or institutional reserves and for some institutions, state support.

While this model has been highly successful for decades, the last several years have witnessed a number of threats to its sustainability. Among these was the downturn in research support to below inflation levels from 2003-2009 (coupled with a sometimes pernicious attitude toward science emanating from both the government as well as the private sector). The magnitude of this problem was significantly worsened by the economic downturn that reached crisis proportions in late 2008 and that resulted in major losses of endowments in universities, non-profit foundations and, in tandem, private and institutional philanthropy in support of research. The full impact of these dramatic funding reductions has been at least temporarily offset by ARRA, which has injected \$8.2 billion into biomedical research. Indeed ARRA funding has had a major positive impact on Stanford (as well as virtually every academic center) but this reprieve may be short lived since ARRA ends with fiscal year 2010. Accordingly, the amount of money that will support research in fiscal year 2011 remains unknown but must be a source of concern – given the overall national budget and looming extraordinary deficits.

There is already considerable debate about whether ARRA support has been meaningful. This question needs to be put into context. A study recently commissioned by the AAMC showed that the nation's 131 medical schools and 400 teaching hospitals employ 1.86 million full-time employees and are directly or indirectly responsible for 3.3 million full-time jobs. Based on the expenditures of academic medical centers the annual total economic impact is estimated as \$512 billion – which means that academic medical centers comprise 20% of the health-care sector of the economy (see <http://med.stanford.edu/ism/2009/november/academic.html> for further detail). ARRA funding has thus been directed to a significant segment of our economy. At Stanford we believe that ARRA has had a significant impact on our research programs and on the preservation and creation of jobs in our community, and we have recently posted a website that describes these positive effects (see: <http://med.stanford.edu/stimulus/>).

The immediate challenge – and the topic of my comments at the AAMC meeting – is how to prepare for the post ARRA funding environment, which begins next year. I highlighted ten issues that are worthy of consideration – all of which we are exploring at Stanford.

1. ***Recruiting and retaining the most talented individuals***: While we have had to impose a hiring freeze during the past two years (especially for basic science faculty), we are hopeful that we will be able to resume hiring selected junior faculty in the next couple of years. We recognize that they are our future lifeblood and best source for continued excellence in discovery and innovation. But we also recognize that considerable institutional resources are needed to recruit the most talented junior scientists. In tandem, we continue to work on retaining our most talented faculty, and we recognize that our faculty are often considered targets of opportunity by other institutions. Successful retention includes providing interim support for faculty whose research funding may have temporarily lapsed. More importantly, it includes fostering an environment that remains attractive and stimulating to the most exciting investigators.
2. ***Being selective in the number of faculty recruited at any one time***: While there is a need to create a critical mass and to sustain excellence in defined areas, it is also true that searching for the best faculty requires time and effort and that ultimate selectivity cannot be compromised. If a search fails to define a candidate of exceptional excellence, it is better to pause and start over rather than to make a compromise that might sacrifice future excellence. A common theme among our departments is the desire to find someone “better than themselves” who provides new talents and skills. This requires considerable effort, and running too many searches at once can dilute focus and lead to inadvertent compromise.
3. ***Being thoughtful about the overall size of the faculty***: A common refrain among medical schools is an expressed desire to grow their faculty and become more prominent in the NIH rankings of institutional funding. I think this is not a wise focus. It is far better to fall short on total funding in favor of having individual faculty who are highly supported and competitive for peer-reviewed funding. This may mean limiting the growth of faculty – which is very much part of the culture at Stanford. However, this view is not shared at most medical schools. I would argue, though, that when resources are constrained – as they are likely to be in the years ahead – it is preferable to have fewer faculty who are each highly competitive and accomplished than to have a larger number of faculty who may compete only on the margin during times when funding pay lines are reduced. I do recognize that most institutions and leaders do not share this perspective – but it should at least be considered.
4. ***Being careful about the size and amount of research space***: A frequent hallmark of success is the number of buildings devoted to research and the amount of laboratory space available to individual investigators. Indeed, a number of institutions have viewed the number of construction cranes on site as a measure of institutional success and even excellence. I would argue to the contrary. It is preferable to have more limited space that is fully occupied and supported than to have excess capacity. Further, it is likely going to

be important to reconsider the amount of space and people any single faculty member or investigator can support.

At Stanford we have long employed space charges to place a premium on research space and have tried to plan new space based on clear faculty projections. We are also focused on supporting common space and shared equipment. Going forward we need to be more focused on reducing the cost of research by faculty, departments and centers. The concept of building space with the hopes of recruiting faculty who will bring considerable research funding with them is a somewhat dangerous strategy and will likely become even more hazardous in the years ahead. I recognize that peer institutions may not share this point of view, but I think it too deserves consideration.

5. ***Reducing expenses:*** I know that individual investigators exercise considerable rigor in controlling research expenses. But I am also confident that, just as in every other endeavor, better ways to reduce administrative expenses and overhead are achievable. This will require considerable effort and planning, since expense control has not been a focus (or even a sought after characteristic) of most faculty – who are appropriately more interested in advancing discovery and innovation. Working more creatively with teams focused on expense reduction and even incentivizing success are strategies that need to be pursued.
6. ***Creating expectations:*** There are major differences in the amount of institutional support provided to faculty in a medical school in comparison to other parts of a university. In fact it is almost invariably considerably less for faculty in medical schools. We think it is important to have defined expectations about how much of a faculty member's compensation and support should be based on grants. This is graded according to faculty seniority and ranges 40 to 60% (or more) for more senior faculty. Clearly this is a source of stress at times when grant funding is diminished, and thus it is important to have some base of support for research faculty as well as resources for bridge funding to cover lapses in funding.

At Stanford we have a defined bridge-funding program in place that, thankfully, has been relatively infrequently used to date. Fortunately, nearly every faculty member who has received funding from this source has been able to restore research funding over time. But there needs to be an expectation that, if grant funding is not successful after bridge funding (and assuming no other extraordinary factors), reductions in compensation are to be anticipated. That is, there cannot be an expectation that research faculty who are not able to support their salary and programs can depend on departmental or institutional support. It is best when this is baked into the culture and is applicable to all faculty members.

7. ***Leveraging funding:*** We have had an active program of providing modest and competitive seed grants to faculty who are addressing new research themes, especially if they are interdisciplinary and/or create bridges between basic and clinical faculty. While results are still somewhat anecdotal, it appears that these seed grants leverage about a 5-10 fold success in subsequent peer-reviewed funding support. They also enable faculty who would not otherwise have necessarily worked with each other to connect – and that

opens new venues for innovation. We have not done enough to support program project grants or big science efforts, since that has run against our traditional institutional priorities and culture. But we are doing that more selectively and will need to put more effort into that in future years – especially if that becomes an increasing focus of NIH support.

8. ***Seeking new funding sources:*** It is also important to seek new sources of funding that can complement or create synergies with traditional federal sponsored research. These might come from non-profit foundations or industry (although attention to potential conflict of interest and intellectual property are important caveats). In California, we have been major beneficiaries of state support for research, especially through the California Institute of Regenerative Medicine (CIRM). CIRM is supported by the 2004 Proposition 71, which allocated \$3 billion to this endeavor. Other states have also begun supporting research in stem cell biology; Texas has recently begun a major funding program for cancer research. These state funding sources are important and can compensate for reductions in federal support. But they may create inadvertent disparities across the nation and could even lead to an expectation that states should fill in the shortfalls of the federal investment in research – which would be potentially dangerous for the future prominence of the USA in biomedical research.

In addition to state, foundation and industry support, it is likely that clinical income will also continue to be sources for funding research at academic medical centers. However it should be expected that this source will be impacted over time by health care reform, which will lead to reduced payments to medical centers and narrower margins. Significant healthcare reform is a clear priority, but it will have consequences on the research mission of many academic centers, especially those that have relied on clinical income as a source for research support.

9. ***Creating buffers:*** Our hope before the economic downturn was to create a buffer for our faculty by raising gifts to support and even endow graduate education. We also hoped to generate significant philanthropic support to provide graduated endowment support for junior faculty that would increase with promotion and tenure. This remains a priority, but our timeline is delayed by the economic downturn. In future years we will hope to generate such support for our medical school faculty in order to provide better insulation against the undulations in sponsored research support.
10. ***Advocating for research funding:*** In addition to doing all we can to better manage our institutions and support our faculty and students, it is essential that leaders of academic medical centers and faculty do all they can to advocate for more stable research funding that, at a minimum, keeps pace with inflation. It would be a tragedy if the economic forces now at play resulted in a deterioration of the unique role the USA has played in advancing research discoveries and innovations. We need to do all we can to support this unique contribution to global health and security.

I have provided a high-level outline of some of the issues we need to address. The list is certainly not comprehensive and the examples are incomplete. But I hope they foster discussion and also

attract comments and suggestions about how we can better support our research mission in the years ahead. Please don't hesitate to offer input and suggestions.

What Students and Trainees (and the Rest of Us) Need to Know about Privacy and Security

In recent weeks several issues have emerged that prompt a review of privacy and security issues that should be available to and known by our learning community. The following list has been generated and provided by the Office of General Counsel, and I provide them for your consideration.

1. **“Need to know” access:** Under federal and state privacy requirements, you cannot access anyone's identifiable health information (“protected health information” or “PHI”) without written authorization, unless you have a need to know for a permissible reason. For medical students, permissible reasons include:

(1) treatment of a patient for whom you have responsibility; and (2) participation in Stanford training programs (*e.g.*, classroom lectures, case studies, morning reports, student presentations, and clinical instruction in the treatment setting). There are a limited number of other permissible reasons to share PHI, such as if it is required by law or necessary for certain health care operations in which you are participating (such as quality-of-care reviews). Research access is addressed below.

Note that PHI is defined *extremely* broadly. It includes not only patient name, medical record number, and contact information, but even initials, treatment dates, birth date, patient zip code, images, a relative's name or identifiable information, and other information that, together with what is otherwise known, could reasonably be used to identify a person. PHI is protected whether the person is living or deceased. PHI can be in any form: written, electronic, or verbal.

Activities that do not meet the “need to know” standard include, for example: using electronic medical record systems to look up a patient for whom you have no treatment responsibility; talking with a family member or friend about a patient case with any reference to PHI; forwarding to or discussing PHI in a School of Medicine chat room or on a social networking site such as Facebook; and sharing PHI with anyone, even at Stanford, who does not have a specific job-related need to know.

1. **Minimum necessary:** You may use, share, or access only the minimum necessary PHI. Accessing more than the minimum necessary PHI is against the law. If you are helping to treat a patient, the minimum necessary could be the full medical record. In contrast, if de-identified information suffices for some educational activities or presentations, or very minimal PHI could be used, then that is all that you may use. Note that Stanford privacy policies restrict the use of certain PHI (such as mental health information) for training or educational purposes; this reflects stricter confidentiality requirements for sensitive information.
2. **Research:** If you are conducting any research using PHI, you need prior IRB approval. Even before you initiate your research, if you need to know whether there are enough

patients with a specific condition to propose a research study, you must have prior IRB approval and/or approval of the School of Medicine privacy officer; you cannot search the electronic medical records to find this out without prior written approval.

In many studies, the IRB requires researchers to obtain written authorization from individuals to use their PHI for research. The IRB may waive authorization (e.g., in retrospective record studies) if legal criteria are met. Keep documentation of your IRB approvals, both for general recordkeeping purposes and so that you can show your access was permissible if any question is raised.

1. **Security**: Use excellent judgment and follow Stanford security policies to protect the security of PHI. Do not share your password; you will be deemed responsible for access to PHI under your login name. Do not take patient information home or away from the School or Hospital unless it is properly secured (e.g., encrypted for electronic files and a locked container for paper). Avoid using PHI in emails if possible, and if it is necessary, use secure email and follow Hospital patient-email policies.

If you learn of a possible breach of privacy or security, report it immediately to the School of Medicine or Hospital privacy officers at 650-725-1828 or 650-724-2572. Federal and state laws require Stanford to investigate and report breaches very quickly to the government and affected individuals, so it is critical for you to share any information about such an incident immediately with the above contacts.

1. **Legal and public relations risks to you and Stanford**: As electronic medical record systems proliferate and high-profile privacy and security breaches in California and elsewhere have occurred, federal and state officials have enacted new privacy and security laws, which are being aggressively enforced. Significant fines (thousands to millions of dollars) may be imposed on individuals and institutions for a breach or other violation of privacy and security laws, depending on the severity and circumstances.

The California Department of Public Health reports individuals who have violated privacy laws to the relevant licensing boards for review and disciplinary action. In addition, privacy and security breaches are posted on state and federal government websites, and institutions have a legal duty to notify the media of certain breaches.

As one example of the dramatic change in the enforcement climate, federal rules formerly excused a violation if a health care provider did not know of the privacy violation, and could not have known of it even through reasonable efforts. Now, even though the provider did not know of the breach, that same scenario triggers fines, although at a lower level (\$100-\$50,000 per violation) than if the facts show a knowing violation.

Your best protection is to access, use, or share only the minimum necessary PHI, and then only when you have a permissible need to know. Use de-identified information, or encrypted PHI, whenever possible. Keep any PHI secure to avoid unintentional access or a breach.

Some Notable Recent Events

1. ***Frontiers in Human Health***: On November 11th we hosted the first in our new series of cutting edge science and medical topics for the community. This first program focused on Regenerative Medicine and was designed to describe the importance of basic research in creating new knowledge in its own right and as a source of potential and future improvements in human health. This was a dinner event (paid for by the more than 300 attendees) that featured prominent faculty at each table to foster discussion and dialogue. The event also featured an interactive dialogue on regenerative medicine by three faculty members representing different fields and disciplines. They included **Ben Barres**, MD, PhD, Professor of Neurobiology, Developmental Biology and Neurology and Neurological Sciences (and Associate Member of the Neurosciences Institute); **Jennifer Cochran**, PhD, Assistant Professor of Bioengineering; and **Marius Wernig**, MD, Assistant Professor of Pathology (and Member of the Institute for Stem Cell Biology and Regenerative Medicine). Following brief comments and reflections on their own work, Paul Costello, Executive Director of the Office of Communication and Public Affairs, led a panel discussion with Drs. Barres, Cochran and Wernig as well as with the audience. It was a highly successful event – also evidenced by the fact that more than 100 individuals were on a waiting list to attend. We will be doing a series of similar events in the future.
2. ***Women's Cancer Center: Under One Umbrella***: Thanks to the outstanding efforts of a volunteer host committee led by **Lisa Schatz** along with Co-Chairs **Susie Fox**, **Lainie Garrick**, **Lisa Goldman** and **Dianne Taube** and an excellent committee as well as outstanding support from our Office of Medical Development, we hosted a terrific event benefiting the Women's Cancer Program at Stanford. I should quickly add that this event was catalyzed by the participation and attendance of Academy Award winning actress **Nicole Kidman** and her Grammy Award winning husband **Keith Urban**. Ms. Kidman has been a long-time friend and supporter of **Dr. Jonathan Berek**, Professor and Chair of Obstetrics and Gynecology at Stanford and director of the Women's Cancer Center. In addition to wonderful comments by Ms. Kidman, which were especially laudatory about Dr. Berek and his wife Deborah, the event also featured a performance by Keith Urban. And as wonderful as these were, most moving were the comments **Dr. Ellie Guardino**, Assistant Professor of Medicine, who recounted her commitment to improving the lives of women facing breast cancer through research and its ultimate application to patient care. Her message was made even more poignant by her recounting of her own recent struggle with cancer and how it transformed her life and family – and led to a rededication to being a physician- scientist who helps others. Dr. Guardino's comments reminded us why our cause and mission are so important. And the several hundred attendees who were the beneficiaries of this moving benefit will hopefully be even stronger advocates and supporters of the Stanford Cancer Center.
3. ***Alumni Gathering in Boston***: On the evening of Sunday, November 15th, the Stanford Medical Center Alumni Center hosted an event in Boston in conjunction with the annual AAMC meeting. Nearly a hundred alumni (out of the over 400 in the greater Boston area) attended. **Dr. Linda Clever**, Associate Dean for Alumni Affairs, hosted the event, which permitted alumni to reconnect and refresh their memories of their time at Stanford. I gave

an update on our activities, especially in education, and we had a terrific discussion with Stanford alumni across many generations.

4. **Team Science Training 2009:** During the week of October 26th, over 60 faculty, students, and staff gathered at Quadrus Conference Center to participate in the medical school's first ever "Team Science Training Program." This course was led by Dr. Margaret Neale, a professor of organizational behavior at the Stanford Graduate School of Business. Sponsored by the Career Development and Diversity portion of the Stanford Clinical and Translational Science Award (CTSA), the program was designed to equip scientific teams with the knowledge and tools needed to improve their productivity.

Given the importance of teamwork in the conduct of clinical and translational research, this type of training will continue to be an important focus of the current CTSA. More information about the Team Science Training Program is available at: <http://med.stanford.edu/diversity/ctsa/pastprograms.html>

Upcoming Events

Stanford Health Policy Forum:

Key Challenges in Pharmaceutical Regulation

A Discussion with Donald Kennedy, PhD, President Emeritus of Stanford University and John C. Martin, PhD, Chairman and CEO, Gilead Sciences

Moderated By **Daniel P. Kessler**, Stanford University

Wednesday, December 9, 2009

11:00 a.m. to 12:30 p.m.

Clark Center Auditorium

This forum is free and open to the public, however due to space limitations, please RSVP online at <http://www.stanfordtickets.org/> or visit <http://healthpolicyforum.stanford.edu/> Additional information on Stanford Health Policy Forums can be found at <http://healthpolicyforum.stanford.edu/or> or by calling 650-725-3339.

Awards and Honors

- **Dr. David Relman** was named the first Thomas C. and Joan M. Merigan Professor: The event formally announcing Dr. David Relman as the first Merigan Professor was notable and significant on multiple levels. First, the new professorship is named in honor of Dr. Tom Merigan and his wife Joan. As you likely know, Tom Merigan is one of the world's pioneers in infectious disease research with a particular focus on chronic viral infections, especially hepatitis and HIV/AIDS. His contributions are nonpareil. In addition to the honor of an endowed chair that recognizes Dr. Merigan, it is also notable that the financial source for the chair comes from his own personal resources and those of his family and friends. Clearly this is a wonderful affirmation of a life committed to science that will now be sustained in perpetuity. Dr. Relman, in his still relatively short career, has opened new vistas to the novel diagnosis and pathogenesis of bacterial disorders and

to the greater role of bacteria in global ecology, biodiversity, biosecurity and beyond. The new chair provided a wonderful opportunity to celebrate both the career of Tom Merigan and the exceptional contributions of Dr. Relman. Please join me in extending our appreciation to Tom and Joan Merigan and our congratulations to Dr. Relman.

- ***Dr. Lucy Shapiro, Virginia and DK Ludwig Professor of Developmental Biology and Dr. Harley McAdams, Professor of Developmental Biology*** are the 2009 co-recipients of the 2009 John Scott Award. This prestigious award was first given in 1834. Previous recipients include such notable inventors and discoverers as Madame Marie Curie, Thomas Edison, the Wright brothers, and Jonas Salk, among others. Drs. Shapiro and McAdams received the 2009 John Scott in recognition of “their application of electrical circuit analysis to genetic networks, which enlightened our understanding of living cells.” The award was presented on November 20th in Philadelphia.
- ***Dr. Craig Miller***, the Thelma and Henry Doelger Professor of Cardiovascular Surgery, received the Eugene Brauwald Academic Mentorship Award from the American Heart Association on November 15th for “his exceptional 30-year record of training, mentoring and enriching the career development of emerging cardiovascular surgeons and researchers.”
- ***Dr. Sandy Napel***, Professor of Radiology, has been elected to the College of Fellows of the American Institute for Medical and Biological engineering (AIMBE). Located in Washington, D.C., AIMBE is the leading advocacy group for medical and biological engineering and is comprised of some of the most important leaders in science and engineering, the top 2% of medical and biological engineers.
- ***Alan M. Garber***, Henry J. Kaiser Jr. Professor and Prof of Medicine &, by court, of Economics, HRP & Economics in the GSB & Senior Fellow at FSI & SIEPR and Stanford Health Policy Director, has been awarded the Society for Medical Decision Making’s career achievement award. Presented at the SMDM annual conference, the award recognizes senior investigators who have made significant contributions to the field of medical decision making.

2009 CTSA Seed Grant Awardees: The Office of Community Health is pleased to announce the recipients of the 2009 CTSA Seed Grants. These awards provide research/project funding for Stanford faculty to form new community-based partnerships, enhance existing partnerships or support implementation of a community-based research project with community-based organizations in San Mateo or Santa Clara counties. This year’s award recipients include:

- **Lisa Chamberlain, M.D., MPH** , Assistant Professor of Pediatrics and **Meg Itoh, M.D.**, Pediatric Resident, Lucile Packard Children’s Hospital for: Understanding the Lives and Health Needs of Refugee Foster Care Youth in Santa Clara County
- **Halsted R. Holman, M.D.** , Professor of Medicine, Emeritus for: Improving Care for Chronic Disease through a Community Partnership

- **Samuel So**, M.D., FACS, Director, The Asian Liver Center at Stanford University for: Studying the Efficacy of Education and Community Center Vaccination and Screening Services to Reduce Chronic Hepatitis B
- **Dee West**, Ph.D. Professor, Department of Health Research and Policy and **Bang Nguyen**, Dr.PH , Consulting Assistant Professor, Department of Health Research Policy for: Building Community Academic Partnerships for Cancer Control Research
- **Eunice Rodriguez**, Dr.PH , Associate Professor, Department of Pediatrics and Center for Education in Family and Community Medicine and **Nancy Morioka-Douglas**, M.D., MPH, Clinic Professor, Clinic Chief, Stanford Family and Community Medicine for: Refining and Disseminating HealthyU: A Health Science Learning Journey
- **Michaela Kiernan**, Ph.D. Senior Research Scientist, Stanford Prevention Research Center for: Translation of Group-Based Behavioral Obesity Treatments to Extend Community Reach

Congratulations to all.

Appointments and Promotions

- **Michael Dake** has been appointed to Professor of Cardiothoracic Surgery, effective 12/01/09.
- **Craig Levin** has been appointed to Professor (Research) of Radiology effective 12/01/09.

Dean's Newsletter December 14, 2009

Happy Holidays!

I want to wish you and your family a very Happy Holiday Season. I know this has been a challenging year for everyone – both personally and professionally. I am deeply grateful and indebted to our students, staff and faculty for their incredible work and many accomplishments during 2009. I recognize that the life of a medical center never really stops but I do hope that each of you can find some restful time during the University's Winter Closure. It is perhaps the only time of the year when campus activity – and notably email traffic – really does slow down. I hope you each have time with family and friends (or whatever you choose to do) but would encourage each of you to use discretion in sending email communications – limiting them will be a good way of giving the gift of “peace and goodwill” to your Stanford friends and colleagues. Best wishes for 2010!

2009: A Notable and Memorable Year

There can be no denying that 2009 has been a remarkable year, with major ups and downs in the economy, our national agenda, our image on the world stage and, closer to home, our very sense of personal and institutional security and well-being. I'm sure I don't need to remind you that the economic meltdown that became so apparent in September 2008 has dominated much of our attention and agenda this year. As 2009, the 50th Anniversary of the school's move to the Stanford campus, draws to a close, I am reminded of the many successes of our students, staff and faculty despite the enormous challenges each has faced personally and professionally. That said, there is no denying that each of us has faced significant losses in personal savings and financial security. Nonetheless, for the most part, we have much to be thankful for.

I don't deny that we anticipate a number of major challenges in the years ahead. However, as a school, we have weathered the storm as well or better than nearly all other medical schools and, at least for 2010 we don't anticipate any major changes in our overall portfolio. Our success to date is a tribute to the diligent work of many leaders throughout the school – at the individual, division, department, center, and institute level. Many hard decisions and choices were made, not always with popularity or even appreciation, but in the aggregate they have provided stability at a time of major loss and uncertainty. I am grateful to everyone but want to thank in particular the work of Marcia Cohen, Senior Associate Dean for Finance and Administration, for her diligence and leadership during a most challenging year. Despite a major downturn in our endowment, gifts and support from foundations, the School's consolidated financial statement at the end of the fiscal year ending August 31, 2009 showed a surplus of \$34 million. While there was a loss in our central administrative units, nearly all of our clinical departments posted a positive margin – which, given the incredible events of 2009, is quite remarkable.

How did this happen? There is no denying that everyone sacrificed in some manner over this past year. Except for equity purposes or promotions, compensation for faculty and staff was held flat and, in some cases, voluntarily reduced. The school's central administrative units reduced expenditure by nearly 15% and, unfortunately, had to layoff or reduce effort levels for 40 staff members due to programmatic changes or closures. While such cutbacks were proportionally lower in our departments, especially the clinical departments, they experienced a number of cost shifts and expenditures that required considerable sacrifice as well.

More specifically, the consolidated FY09 (September 1, 2008 – August 31, 2009) year revenues for the school totaled \$1.115 billion. The major sources of revenues were: sponsored research (direct costs of \$280 million and indirect cost recovery of \$108 million), which were up 1 and 3% respectively compared to FY08; clinical income, \$356 million (up 14% from FY08); and designated funds of \$105 million (up 15%). We are distinctive even among research-intensive peers in having slightly more income from sponsored research (34% of total revenues) than clinical income (32% of total revenues). I should hasten to add that while the faculty did extremely well in competing for ARRA (American Recovery and Reinvestment Act) funding (aka "stimulus funding"), the impact on the FY09 budget is minimal given the timing in the fiscal year of receipt of the funding from the NIH. Not surprisingly, expendable gifts were down 9% in FY09 compared to FY08 (\$67 vs. \$74 million).

Viewed from the perspective of financial stability, it should be noted that because of the work of our faculty, each of the clinical departments had a year-end clinical surplus – some of which will

be used to pay incentive bonuses that are part of faculty compensation. Another measure of our financial integrity is the strength of our endowment and reserve balances (or expendable fund balances). As I have reported in past newsletters, the Stanford University endowment was significantly impacted by the 2009 fiscal crisis. The School of Medicine endowment, which is invested with the University Merged Endowment Pool, experienced a loss of 26.4% or \$601 million, resulting in an August 31, 2009 market value of \$1.676 billion – which is still the second highest among US medical schools. Coupled with this are expendable reserves of \$473.6 million (\$318.2 of which is in departments and, to significant extent, in restricted faculty accounts). It should not be missed that this level of fiscal stability is superior to most any medical school and greater than many universities in the aggregate.

Based on these financial results, we believe that our FY10 budget gaps have been largely addressed, and we don't anticipate (at this time) any new major expenses or revenue losses. That said, an important lesson of 2009 is how volatile the financial marketplace can be, underscoring the importance of fiscal prudence and financial cushions to weather stormy times (and we have had quite a tsunami this past year). Looking forward, we will benefit over the next year from our ARRA research awards of \$87 million to date but, at the same time, we need to get ready for a likely downturn in NIH funding in FY11. Despite the President's clear commitment to science and technology, early forecasts is that the base NIH budget (that is, without the ARRA stimulus of \$10.4 billion) will rise at 2% -- less than inflation. This will almost surely mean a return to the constrained research funding we all experienced in the post-NIH doubling era from 2003-2009. Anticipating and preparing for this will be an enormous challenge – although, given the overall excellence of our faculty and the fact that we are not carrying significant debt or underutilized research space, we are as well positioned as any school to meet it..

As I write this newsletter (while returning from Washington DC and meetings with the Association of American Medical Colleges), the impact of healthcare reform stands as the big unknown. Needless to say, the scope of the proposed reform is a slim shadow of what might have been, and its overall impact is uncertain. Given the continued rise in healthcare costs it is inevitable that downward pressures on costs and expenditures are inevitable, and the only thing that seems certain at this time is that revenues for healthcare will decline. While this will surely be a challenge, it is also a necessity – but the size, scope and nature of the changing healthcare economy could have major impacts on academic medical centers.

Regardless of the external economic pressures, it is incumbent on Stanford to strive for excellence in the delivery of innovative, highest quality patient care with the lowest possible costs and excellent patient service. It is also imperative that we plan carefully for the further development and maturation of the shared integrated clinical services of the School of Medicine, Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. These services need to embrace not only the Medical Center but our community regionally and more broadly.

Given the obvious challenges of supporting our missions in education, research and patient care, I would be remiss in not highlighting at least a few of the accomplishments of our students, faculty and staff during this past year. We have continued to admit amazingly talented medical and graduate students and to be able to educate them in highly successful programs and with among the lowest overall debt burdens in the nation. And in just a handful of months we will

begin educating our students in the new Li Ka Shing Center for Learning and Knowledge (LKSC), which will offer unparalleled opportunities for innovative approaches for knowledge and skill acquisition. Not only will the LKSC be central to student education, it will also become the locus for pioneering continuing and life-long education for faculty and the community and for a paradigm shift in how medical education is conducted.

Also in 2009 we reached out to the community in a number of novel education and learning programs, most notably our Mini-Medical School, the first quarter of which (The Dynamics of Human Health) enrolled more students than any other course in the history of the Stanford's Continuing Studies Program. I want to thank Kathy Gillam for her incredible help with this course and Dr. Sherry Wren for serving as the course co-director – along with the amazing faculty who taught these sessions. In case you are interested, they will be available on Stanford iTunes in early 2010.

In addition to the big boost from ARRA funding, among the most notable events of 2009 was President Obama's affirmation of the importance of science and innovation – a statement that began the reversal of the anti-science sentiments that dominated the prior eight years. An enormous amount of advocacy work remains to be done in order for research funding to break away from the past decade's peaks and valleys and arrive at a more predictable level of support that keeps pace with inflation. Still, we must be thankful for the ARRA boost, which came at a critical juncture for Stanford's and our nation's biomedical research enterprise.

Even more important from my perspective than the purely quantitative success of research awards is the nature of the awards our faculty continue to receive. Stanford boasts the highest number of NIH Pioneer awards of any university in the nation (four new ones were added in 2009) along with an amazing number of Innovation Awards, Challenge and Grand Opportunity Awards. In addition, Stanford has the largest number of awards and amount funding of any school in California from the California Institute for Regenerative Medicine (CIRM), including, most recently, three of the 14 major CIRM translational disease awards. The number of distinguished research awards from foundations is equally remarkable, as is an incredible number of faculty awards and honors. What makes a university great is the quality of its faculty and here Stanford is exceptional. At the same time, we have been limited by economics in the recruitment of new basic science faculty – which has been a real source of disappointment and is something I hope we can begin reversing in 2010 and beyond.

One of my major goals over the past years has been to foster the development of our clinical programs to be as excellent as our efforts in research. Thanks to the recruitment of a number of excellent chairs, the combined efforts of faculty leaders across the school and important partnerships with SHC and LPCH, we have witnessed important successes – especially in national rankings on quality metrics – and some improvements in overall service (although much work remains in this arena). The new programs sponsored by SHC at the North Campus in Redwood City along with the Sherman Avenue Imaging Center have been notable additions. So too is our increasing presence as an NCI Cancer Center – the three-year review for which occurred in mid-October. And our increasing success in clinical and translational research is being fostered by the CTSA, the SPARK program and important collaborations including the one with the Northern California Cancer Center. Further, the number of community- based programs

is growing, and opportunities in global health are becoming more robust with the creation of the Office of Global Health this past year.

Despite the pressures of the past year, faculty support and development have been a focus of departments and the school, and progress is being demonstrated in enhancing diversity and leadership as well as the retention of women faculty. It is notable that in the most recent COACHE survey, Stanford faculty are clear (compared to peers) in their overall satisfaction at the School of Medicine (for more information, see <http://deansnewsletter.stanford.edu/#2>). That said, there are many aspects of faculty development and support that need improvement at the departmental as well as school-wide levels, and this must be a continuing emphasis for the future.

So, as we reach the end of 2009 it seems clear that despite the many challenges, we have done well as a community and as a school and medical center. This is directly proportional to the efforts of our staff, faculty and students, and it is important to pause and both celebrate and thank each of them. But we can't pause too long since the next wave of opportunities and challenges loom before us. I am confident that we will find ways to succeed despite constraint and adversity as long as we function as a community that supports each other and our important missions. That is always a challenge in a time of constraint – but, in the end, it is what distinguishes leaders and institutions.

Laurel Price Jones Named AVP and Director of the Office of Medical Development

I am very pleased to announce that Laurel Price Jones will become our Associate Vice President and Director of the Office of Medical Development on January 1, 2010. She succeeds Doug Stewart, who left this position in February 2010.

Ms. Price Jones has most recently served as the Vice President for Development and Alumni Affairs at George Washington University, where she doubled the fundraising success, secured two of the university's largest gifts in its history and supervised a staff of 224 individuals. Prior to her position at GW, Ms Price Jones served as the Vice President for Development and Alumni Affairs at the Rochester Institute of Technology. In addition to her university-wide experience, Ms Price Jones has had notable medical center experience, having previously served as the Managing Director of the Development Department at University Hospitals of Cleveland and the Director of Corporate and Foundation Relations at the Cleveland Clinic. She began her career in development at Oberlin College, where she also graduated with a Bachelor's degree in Physics and a Master's degree in Biology.

Ms. Price Jones brings an outstanding record of experience and accomplishment to her new role at Stanford. Importantly, she has won respect and praise from trustees, faculty and university leaders in all facets of her career. She was selected through a national search, and I am extremely pleased she has accepted this incredibly important leadership position in the School of Medicine. Please join me in welcoming Ms. Price Jones to Stanford.

Department Success in Faculty Counseling

One of the most important activities of departments is their essential role in mentoring, counseling and guiding the career development of junior faculty. Giving feedback to faculty is a critical part of this process and is something that is taken seriously at the departmental and school level. Each year the Office of Academic Affairs tracks the success of departments in documenting compliance in annual faculty counseling. For the past three years twelve (12) departments have had 100% success in faculty counseling, and I would like to single them out for special thanks and appreciation. They are:

Departments with 100% Success in Faculty Counseling for the Past 3 Years	Department Chair
Anesthesia	Dr. Ron Pearl
Comparative Medicine	Dr. Sherril Green (and previously Dr. Linda Cork)
Dermatology	Dr. Al Lane
Developmental Biology	Dr. Roel Nusse
Health Research and Policy	Dr. Phil Lavori
Medicine	Dr. Ralph Horwitz
Neurobiology	Dr. Ben Barres
Neurology and Neurological Sciences	Dr. Frank Longo
Ophthalmology	Dr. Mark Blumenkranz
Orthopaedic Surgery	Dr. Bill Maloney
Otolaryngology: Head and Neck Surgery	Dr. Rob Jackler
Pathology	Dr. Steve Galli

I offer my appreciation and commendations to each of these departments and to their Chairs. I hope that in the future all of our departments will have a 100% success rate.

The 2010 & 2011 School of Medicine Faculty Fellows

The Office of Diversity and Leadership received a wealth of nominations for outstanding candidates for the 2010 Faculty Fellows program. Owing to the broad range of seniority within the pool of nominated candidates, the review committee selected one cohort of Faculty Fellows for 2010, and a class of more senior Fellows who will participate in this year long program beginning in 2011.

We are delighted to announce the selection of the 2010 Faculty Fellows: Amin Al-Ahmad, MD (Medicine), Eliza Chakravarty, MD (Medicine, Immunology/ Rheumatology), Alan Cheng, MD (Pediatric Otolaryngology), Emilie Cheung, MD (Orthopaedic Surgery), Robert Dodd, MD (Neurosurgery), Hayley Gans, MD (Pediatrics), Neeraja Kambham, MD (Pathology), Jonathan Kim, MD (Ophthalmology), Maarten Lansberg, MD, PhD (Neurology), Jason Lee, MD (Surgery), Chris Longhurst, MD (Pediatrics), Merritt Maduke, PhD (Molecular & Cellular Physiology), Karen Parker, PhD (Psychiatry), Anna Penn, MD, PhD (Pediatrics/Neonatology),

Matthew Strehlow, MD (Surgery/ Emergency Medicine), and Lu Tian, ScD (Health Research & Policy).

The candidates chosen for the 2011 class are: Annelise Baron, PhD (Bioengineering), Matthew Bogyo, PhD (Pathology), James Brooks, MD (Urology), A. Dimintrios Colevas, MD (Medicine/ Oncology), Tina Cowan, MD (Pathology), David Firoentino, MD, PhD (Dermatology), Miriam Goodman, PhD (Molecular & Cellular Physiology), Steven Lindley, MD, PhD (Psychiatry), Sean Mackey, MD, PhD (Anesthesia), Nancy Ewen Wang, MD (Surgery/ Emergency Medicine), David Weill, MD (Medicine), and Wei Zhou, MD (Surgery).

The Faculty Fellows program brings these faculty members together for monthly meetings featuring invited leaders who serve as role models by sharing their own leadership journeys, describing their own leadership styles and addressing specific challenges they have faced in their own careers. In addition, small mentoring groups led by senior faculty mentors meet once between each of the dinner meetings to discuss leadership challenges specifically and in general. Other topics, such as work/life balance issues, are also open for discussion.

Fellows also engage in a structured development planning process aimed at identifying opportunities for growth and development. The result is a personalized career development plan that they implement with their chair or division chief.

Candidates are nominated by their department chairs and other supervisors and are ranked on the basis of leadership potential and demonstrated commitment to building diversity. A review committee consisting of Drs. Hannah Valentine, Julie Moseley, Richard Shaw, Juliana Barr and Sanjeev Dutta, actively participated in selecting these two groups.

School of Medicine Staff Recognition Program

The School of Medicine's Annual Staff Recognition Program has been a long-standing great tradition to honor staff contributing many years of service to the school. This year, a new program is planned. It will include a multimedia event/reception to be held on Thursday, April 22, 2010 at the new Li Ka Shing Center for Learning and Knowledge (LKSC), from 4:00 to 6:00 PM. This recognition event will honor staff who celebrated anniversary dates in calendar year 2009 for 5, 10, 15, 20, 25, 30, 35, and 40 years of service. SPIRIT Award winners will also be honored at this event.

Staff members who reached a service date mentioned above in the calendar year 2009, will receive their invitation for the April event this month. The invitation will include additional information about the Recognition Program. In March, a brand new employee recognition web site will be launched with videos, photos, and comments from awardees and supervisors.

Stay tuned for more communications and information as we plan this new program. We look forward to honoring many employees who have contributed so many years to the success of the School of Medicine!

Awards and Honors

- ***Fellowship and Faculty Awards benefiting the Lucile Packard Children's Hospital and the pediatric programs at Stanford University School of Medicine*** were acknowledged and celebrated at an event on November 30th. Thanks to the generous support from individuals committed to advancing the health of children, 72 fellows and faculty – along with a number of the individuals who made these awards – were honored for their important contributions.
- ***The Radiological Society of North America (RSNA)*** made major awards to two Stanford faculty members. **Dr. Gary Glazer**, Professor and Chair of the Department of Radiology, was awarded the Gold Medal, the Society's highest honor, in Chicago at the RSNA's annual meeting in December (<http://med.stanford.edu/mcr/2009/glazer-0626.html> for the earlier announcement of this honor). Dr. Glazer joins other Stanford luminaries in receiving this honor – notably Malcolm Bradshaw (1999), Herbert Abrams (1995) and Robert Newell (1958).

In addition, **Dr. Sam Gambhir** is the 2009 RSNA Outstanding Researcher Award winner. This award is given “to recognize and honor one senior individual who has made original and significant contributions to the field of radiology or radiologic sciences throughout a career of research.”

Please join me in congratulating Drs. Glazer and Gambhir.

Appointments and Promotions

Denis P. Bouvier has been appointed to Clinical Associate Professor of Medicine (General Internal Medicine), effective 12/01/09.

Jauhtai Joseph Cheng has been appointed to Clinical Assistant Professor (Affiliated) of Psychiatry and Behavioral Sciences (Geriatric Medicine), effective 11/01/09.

Melissa M. Chin has been promoted to Clinical Assistant Professor (Affiliated) of Medicine (General Internal Medicine), effective 10/01/09.

Jenifer L. Culver has been promoted to Clinical Associate Professor of Psychiatry and Behavioral Sciences, effective 12/01/09.

Jeffrey L. Fraser has been reappointed to Clinical Associate Professor (Affiliated) of Neurology, effective 11/01/09.

Julieta M. Gabiola has been promoted to Clinical Associate Professor of Medicine (General Internal Medicine), effective 11/01/09.

Phillip M. Harter has been appointed to Associate Professor (Teaching) of Surgery, effective 12/01/09.

Gary E. Hartman has been reappointed to Clinical Professor of Surgery (Pediatric Surgery), effective 10/01/09.

Frank T. Kagawa has been reappointed to Clinical Professor (Affiliated) of Medicine (Respiratory and Critical Care Medicine), effective 9/01/09.

David M. Kahn has been promoted to Clinical Associate Professor of Surgery (Plastic and Reconstructive Surgery), effective 11/16/09.

Cynthia J. Kapphahn has been reappointed to Clinical Associate Professor of Pediatrics (Adolescent Medicine), effective 9/01/09.

Albert C. Koong has been promoted to Associate Professor of Radiation Oncology, effective 12/01/09.

Vladimir Nekhendzy has been reappointed to Clinical Associate Professor of Anesthesia and of Otolaryngology – Head and Neck Surgery, effective 12/01/09.

Harman Singh Paintal has been appointed to Clinical Assistant Professor (Affiliated) of Medicine (Pulmonary and Critical Care Medicine), effective 10/01/09.

Kimberly G. Shepard has been promoted to Clinical Associate Professor (Affiliated) of Otolaryngology – Head and Neck Surgery, effective 10/01/09.

John Stevenson has been reappointed to Clinical Assistant Professor (Affiliated) of Surgery (General Surgery), effective 9/01/09.

John M. Sum has been reappointed to Clinical Associate Professor (Affiliated) of Pediatrics (Neurology), effective August 1, 2009.

Gloria W. Wang has been appointed to Clinical Assistant Professor (Affiliated) of Ophthalmology, effective 10/31/07.

Lauren J. Witcoff has been reappointed to Clinical Associate Professor of Pediatrics (Pediatric Pulmonary Medicine), effective 9/01/09.

Dean's Newsletter

January 11, 2010

Questions, Challenges and Opportunities for 2010

As we came to the end of 2009, many pundits focused on the negative aspects and “disasters” of the first decade of the 21st Century. Of course there can be no denying the ups and (mostly) downs of the past decade, which opened with high anxiety over Y2K and closed with high

anxiety over the national and global economic crisis (amid many other problems). This approach leads many to be happy to bid adieu to the past 10 years of job losses, stock market crises, unpopular wars and terrorism, among so many other problems. Some critics said that the movie “Up in the Air” would be seen in the future as describing our moral condition and national mood in 2009 in the same way that “It’s a Wonderful Life” depicted the end of the 1930’s. What a horrible thought!

While not minimizing or overlooking the very serious financial, human and moral issues that characterized the past decade, I believe that it nevertheless represented a period of excellence for the School of Medicine. We emerged from the unfortunate merger and de-merger with UCSF with a clearer sense of mission, and over the past decade we have achieved remarkable success in each of our missions of education, research and patient care. And we also performed well in improving our financial security, despite the very difficult challenges and losses we experienced in 2009 (see <http://deansnewsletter.stanford.edu/#2>). For instance, in education, the past decade witnessed an innovative new curriculum for medical education, a new Masters in Medicine program for PhD students, the ARTS program for clinical fellows, and the launch of the Stanford Society of Physician Scholars program, which links residents with each other and with our students as well as with our broader academic mission and opportunities. Now we have an additional goal of developing new venues for enriching the pipeline for educating future physicians and scientists through programs that extend to the high school level.

During the past decade we have also seen remarkable accomplishments by students and faculty who won many major and highly coveted awards and honors – some in numbers disproportionate to the size of our Stanford community. We recruited hundreds of new faculty, enriched our leadership and opened many new and exciting programs. We launched the Stanford Institutes of Medicine, which complemented the success of our basic and clinical departments, centers – and of course individual faculty. Our clinical programs have expanded, and relations with our major affiliates (Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital) have become further integrated and robust; these are complemented by important relations with the VA Palo Alto Health Care System and the Santa Clara Valley Medical Center.

We are witnessing a transformation of our medical campus, fueled in part by fund raising – over \$1.17 billion since 2001. Our image in the media has been transformed and now highlights the successes of our faculty and school rather than misdeeds. And we have played important leadership roles in some of the most important debates in academic medicine – including embryonic stem cell research, individual and institutional conflict of interest and academia - industry relationships, funding for research and the future of health care and its reform. While I am also aware of missed opportunities, I do believe that the state of health of the Stanford School of Medicine is far better than it was at the beginning of the past decade. Because of our individual and collective contributions we have overcome and even exceeded many challenges and obstacles, and we stand poised for exciting times ahead.

As I look forward to 2010 and beyond, a number of important challenges and questions come to mind. Because we have so many important constituencies and interlinked missions, it is not appropriate or fair to focus on just one aspect of our broad enterprise. Of course we ultimately need to prioritize what can be addressed or accomplished during any particular span of time, but

keeping a running list of important issues, challenges and needs is also important. So, I will take the liberty of sharing some of my thoughts regarding questions and issues I am thinking about in a number of key areas. I want to underscore that these thoughts are not exclusive nor do they convey promissory notes. Rather they are meant to highlight what I think are important areas for focus and hopefully to provoke you to comment on them and add additional reflections and recommendations.

Since this is an iterative process it is best to view the following as a list of issues as of the beginning of 2010 – with adjustments, additions, deletions and prioritizations to occur during the next year and beyond. To help organize them, I am listing my issues and questions in specific categories – although I do recognize that there is considerable overlap as well. In some ways this is similar to the process I followed in initiating our Strategic Plan *Translating Discoveries*, when I highlighted questions and opportunities in my first Dean’s Newsletter on April 2, 2001 – my first day at Stanford (see: http://deansnewsletter.stanford.edu/archive/04_02_01.html).

- **Medical Student Education:** The New Stanford Curriculum was launched in the Fall of 2003 and has been fine tuned since then. It brought a major realignment of basic and clinical science education along with a requirement for Scholarly Concentrations. The New Curriculum initially focused on the preclinical years but has subsequently been complemented by changes in clinical education as well as the more recent introduction of Educators 4 Care and other innovations.
 - With the opening of the Li Ka Shing Center for Learning and Knowledge (LKSC) and, in particular, the Goodman Simulation Center, scheduled for mid-2010, the question of how clinical education will evolve and change with greater access to simulation and immersive learning becomes important. Of course it is our hope that there will be highly significant changes in this area– but this will be a work-in-progress that really commences in 2010.
 - During 2010 we need to bring to resolution and implementation the policies, process and procedures for evaluating the performance of medical students during clinical education.
 - The work of the task force on medical student tuition needs be concluded and implemented.
 - Our financial aid program for medical students remains among the best in the nation (although our endowment resources have been dramatically reduced because of the 2009 fiscal crisis), but we need to reassess how financial aid is provided and ask whether new approaches (including selective merit based scholarships) should become part of the overall portfolio.
 - It is important to re-examine the length and scope of medical education and its continuum through residency and fellowship training. Among the issues needing evaluation is whether we can alter the length or expectations of undergraduate education for selected students admitted to Stanford and whether specific medical school tracks or pathways can be coupled with modifications of residency and fellowship training. The goal is to assure academic excellence as well as to shorten the overall duration of training.
 - As I have noted in prior communications, the Association of American Medical Colleges (AAMC) has called on medical schools to increase class size by 30%.

While the putative reason for this proposal is to address a projected physician workforce shortage (especially in primary care), it is not clear that simply increasing class size will be of benefit unless accompanied by concurrent changes in postgraduate (residency and fellowship) training as well as new career opportunities. For example, to make primary care more attractive, it is important to adjust compensation opportunities as well as work expectations.

I have previously noted that more attention needs to be given to how non-physician healthcare providers can contribute to the medical workforce and how the role of physicians as primary care providers or specialists should be redefined. As part of our mission in training physician leaders and scholars it is important for Stanford to engage in this debate. The question of whether we should increase our class size and, if so, to what purpose also needs further debate and discussion. In addressing these issues it will be imperative to balance our resources and stay true to our key missions.

- ***Graduate Student Education***

- We continue to attract outstanding students who pursue PhD degrees. There is no question that the small and focused department structure at Stanford affords excellent settings for creating a critical mass for mentoring students. But the question of whether the current departmental structure promotes sufficient interdisciplinary opportunities for students that transcends departmental boundaries remains unresolved. The idea of changing the current structure has proponents and detractors, but this is an area worthy of continued discussion.
- A proposal for a new PhD program in Stem Cell Biology and Regenerative Medicine was recently reviewed and endorsed by the School's Executive Committee. This proposal, which will now proceed to the University Academic Council, has also raised the question of how many degree granting programs (whether departmental or interdisciplinary) – and indeed how many graduate students – the School of Medicine can support, especially at times of fiscal constraint.
- We need to develop additional institutional resources to support the costs of graduate education. This is a major fundraising goal.
- While progress has been made, we need to do more to enhance the diversity of our graduate students. A number of innovative programs are in place through the Office of Graduate Education as well as other programs that seek to prime the pipeline at the high school and college level. This is a long-term and high priority.
- The Masters in Medicine program, founded by Professor Ben Barres, is an innovative offering that has become highly sought after by incoming PhD students. It offers a potential pathway for educating scientists who are skilled and conversant in translational research and clinical medicine. It will be important to assess the impact of this program as well as mechanisms for continuing its support over time.

- ***Postdoctoral Scholars*** (aka Fellows) remain our largest single group of trainees. They include “postdocs,” who have joined specific faculty and research projects and clinical

fellows (see below), who join clinical departments for specialty and research training. Postdocs and clinical fellows are often the unsung heroes of our research and clinical programs. However, given the process of their selection and the highly individualized nature of their work, they can also become the most disenfranchised group in the medical school.

- An important goal must be to continue to improve the professional and personal lives of our postdoctoral fellows. This rung on the training ladder is the closest step to either a faculty position or another initial professional career opportunity. Finding the right balance between mentored research and career independence remains a key goal - particularly in guiding the transition from trainee to Principal Investigator. Of course, mentoring is both essential and something we do with varying success. This is an area in which we need to improve further.
 - Because postdoctoral trainees are lab and program based, it is easy for them to become isolated from each other and from broader university life. The Office of Postdoctoral Affairs (<http://postdocs.stanford.edu/>) has made strides in developing programs for this special group of trainees. Further, the Stanford University Postdoctoral Association (see: <http://www.stanford.edu/group/supd/index.shtml>) provides opportunities for networking and community activities. Supporting and enhancing these programs is a key goal – and I am certainly interested in suggestions about how we might improve the opportunities for postdoctoral scholars at Stanford.
- ***Residents and Clinical Fellows:*** In most institutions, including Stanford, graduate medical education (which defines those serving as residents and clinical fellows) falls under the province of clinical departments and teaching hospitals. This is also true at Stanford. While this is the correct affiliation, it is important to foster greater integration and contiguity from medical school through residency, fellowship and practice. A major new program, the Stanford Society of Physician Scholars , is being launched as a collaborative effort between clinical departments and the Dean’s Office to create new and innovative linkages between undergraduate and post-graduate medical education (see: <http://ssps.stanford.edu/>). This is an important opportunity to develop a truly unique program for Stanford. But given the demands on the time available to residents and the stresses of clinical training, it will be challenging as well and we will need to monitor the program’s impact carefully and critically.
- ***Continuing Medical Education (CME):*** In 2008 Stanford became the first medical school to restrict industry support for specific CME courses or programs in order to control and limit bias and commercial financial influence on our curriculum.
 - Given the changes in academe – industry relations, we have an opportunity to change the paradigm of CME and to focus more thoughtfully on providing physicians with evidence-based learning opportunities as well as a focus on quality and effectiveness in clinical care. This opportunity will be particularly enriched by the resources available for immersive learning and simulation technologies in the Li Ka Shing Learning and Knowledge Center, which will open in the early Fall of 2010.

- We have also been exploring possibilities for rebasing our relationship with industry to promote education while avoiding financial influence or bias. This will be an experiment that will require rigorous oversight and monitoring.
 - The 2009 Fall Quarter and first installment of our “mini-medical school” was highly successful and exceeded all enrollment numbers of Stanford’s Continuing Education programs – ever (see: http://deansnewsletter.stanford.edu/archive/09_28_09.html#4). On Tuesday, January 12th we begin our second quarter of the mini-medical school, which is entitled *Medicine, Human Health, and the Frontiers of Science*, and once again we have reached full capacity (250 students – the limit that can fit into the Braun Auditorium). We look forward to another two excellent quarters of outstanding lectures by our superb faculty.
- ***Alumni Relations and Affairs:*** This has been a year of transition in leadership of the Alumni Affairs with Dr. Linda Clever taking over as Associate Dean from Dr. Ross Bright, who served in this position for nearly two decades. We thank Ross Bright for his major contributions, which included championing and overseeing the new alumni magazine *Bench and Bedside*. Dr. Clever brings incredible energy, experience and commitment to her role, and she will partner with the Stanford Medical Center Alumni Association leaders to improve our interaction with alumni from across the medical center. This is an incredibly important area that must be high priority for the years ahead.
 - ***Basic Research*** remains the fundamental underpinning of Stanford’s excellence and uniqueness – but without continued support its excellence can be vulnerable.
 - During the past couple of years we have had to freeze or hold most basic science recruitments. We need to change this over the next years both to renew excellence and to promote diversity. We also need to better balance the distribution of junior and senior faculty – which has become too tilted toward senior faculty.
 - While research funding in 2009 and 2010 has been significantly improved by the American Recovery and Reinvestment Action (ARRA), which infused \$8.2 billion into the NIH (along with significant increases to NSF and other federal agencies), the stimulus funding ends with this fiscal year. The forecasts for NIH funding in FY11 are markedly reduced by comparison to the level of stimulus funding and will once again pose major challenges for faculty – since pay lines for funding are likely to reach all-time lows. Once again we will need to do all we can to help bridge faculty through rough patches in sponsored research funding. And we will need to do all we can to make the case to Congress and the American public of the importance of supporting and funding basic science research – we are already deeply engaged in advocacy efforts in this area.
 - A major goal remains raising philanthropic support to support our research faculty – ideally beginning with a graduated endowment that commences with the initial appointment and increases at reappointment, tenure and beyond up to an endowed professorship. Given the fiscal meltdown, achieving this will be more difficult – but it is a very high priority.
 - Seed grants through our Stanford Institutes of Medicine and Strategic Centers have been a terrific way to initiate innovative new research and interdisciplinary

research programs, innovations and discoveries. These funds have also leveraged successful competition for sponsored research funding. We need to be able to find ways to continue these seed programs.

- We need to continue to examine the cores and service centers that support basic research and try to establish more successful methods for their support. This may require some consolidation as well as, potentially, co-locations and modified management systems and expectations.
 - An ongoing challenge is our serious limitation in animal space as well as the per diem costs for animal use. A strategic planning effort is underway to address immediate as well as long term plans. We will also need to consider creative and open minded options, including offsite animal facilities that support our broad research programs.
- ***Clinical and Translational Research:*** When our Strategic Plan, *Translating Discoveries*, was initiated in 2002, it reflected our aspirations more than our realities. Over the past several years considerable progress has been made at the departmental and school-wide levels, including a successful application to become an NCI-designated Cancer Center, a successful CTSA application and the launch of the Spectrum Program. These are important accomplishments, but many challenges remain.
 - The pipeline for educating, training and then supporting physician clinical investigators as well as scientists who participate in or lead translational research efforts remains a challenge. While we have made progress we need to do more to enrich the pipeline – and to help foster and develop successful career pathways. This will be a major topic at our 2010 Leadership Retreat – with more to follow.
 - The infrastructure necessary to support clinical and translational research is significant and is made more challenging by the ever-increasing array of compliance requirements and regulatory demands in human subjects research. Finding successful ways to meet these requirements while still fostering innovative clinical research will require continued focus and effort – a process that is underway but which is very challenging.
 - Supporting the career development of clinical investigators is challenging because, among other reasons, these faculty are trying to balance the demands of clinical practice with the stresses of developing a successful portfolio in clinical research. Time and financial pressures are significant – especially the challenge of finding funding sources for clinical research time.
 - We need to develop additional strengths in population science that complement our excellence in basic and clinical research.
 - We need to find better ways to extend our clinical research and clinical trials into the community and to develop more innovative community partnerships that promote diversity and excellence.
 - Continuing to foster connections and interactions between basic and clinical science faculty – as well as those from other disciplines – is critical if we are to promote the most innovative research. Improving communication, shared education and seed funding are among the important aids – but this also requires support from the school’s clinical and basic science chairs and other leaders. This will also be a major topic at our 2010 Leadership Retreat.

- ***Global Health:*** While a number of our faculty and many students have long been engaged in research and education with colleagues around the world, until this year we have not had an organized effort in global health. With the arrival of Dr. Michele Barry as Senior Associate Dean for Global Health we have a unique opportunity to create specific programs as well as an umbrella organization that helps organize and codify important global health initiatives. Building on Stanford's strong entrepreneurial spirit of discovery, Dr. Barry and her colleagues will seek novel ways to foster design, innovation and evaluation on a global and local level. A strategic planning effort is underway and will be rolled out over the course of the next several years.
- ***Patient Care Issues.*** As an academic medical center, we hold clinical care as one of our three core missions, along with education and research. In 2010 and beyond, healthcare reform (in whatever manner and rate it unfolds) will affect how the United States organizes, pays for and delivers patient care. During the past years (and in some cases decades) Stanford has developed considerable excellence in tertiary and quaternary care. While this will remain our core strength and area of excellence we face some major challenges.
 - We need to continue to seek opportunities that differentiate Stanford Medicine as a leader in patient care delivery, innovation, quality outcomes, patient service satisfaction and cost efficiency.
 - We need to develop methods to align a broader physician care network regionally in the Bay Area and beyond that focuses on both primary and specialty care.
 - We are developing a Center for Quality and Efficiency as a joint program with Stanford Hospital & Clinics that will be led by a nationally recognized physician. Further announcements about this will be forthcoming.
 - We need to continue the joint planning activities between the School of Medicine and both SHC and LPCH that reaffirm and recalibrate prior efforts at integrated planning. These strategic planning efforts should help determine the areas for ambulatory and inpatient opportunity, focus and growth, as well as the numbers and skill sets of physicians and faculty needed to assure continued and enhanced success. These efforts need to be interdepartmental and fully aligned with SHC and LPCH.
 - We are currently doing the planned five year review of the "funds flow model" with SHC and are in the final stages of a new "funds flow model" with LPCH. The outcome of these discussions and negotiations will have major implications for the faculty, school and hospitals.
 - We need to engage in more comprehensive planning with the VA Palo Alto Health Services and the Santa Clara County Valley Medical Center, which are important affiliations for the School of Medicine.
- ***Faculty Development, Leadership, Diversity and Satisfaction***
 - Over the past several years we have made considerable progress in fostering faculty development, leadership and diversity – thanks in particular to the efforts of Drs. Hannah Valentine, David Stevenson and their colleagues. But we still have a long distance to travel to achieve the overall excellence we all want in this

critical area. Over the next years the Offices of Diversity and Leadership and Academic Affairs will continue the programs that have been put in place during the last several years and will add new opportunities to promote faculty support and interaction. This is a work in progress – but surely one of the most important areas of need.

- Recent surveys have shown that faculty satisfaction has improved and that in comparison to other medical schools around the country, the overall satisfaction of Stanford faculty stands at the top. But this cannot be interpreted as overall success, since there are clearly many stresses and strains that impact faculty development, especially for the clinical faculty, who bear the continuing pressure of serving multiple missions simultaneously. We are exploring ways of reducing stress, including implementation of alternative work schedules. I am particularly concerned about the career development of our outstanding women faculty, since national data continue to demonstrate their disproportionate loss from faculty ranks – especially early in career development. We will be reviewing proposals to address these issues at upcoming Executive Committee meetings and I will share the results with you as they unfold.
- I have previously reported that faculty at Stanford feel certain that research is highly valued but are less clear about the perceived value of our missions in clinical care and education at both departmental and school-wide levels (see: http://deansnewsletter.stanford.edu/archive/11_23_09.html#2). I have also been clear in my own communications about this, emphasizing that our future success as an academic medical center mandates that we value equally and support each of our missions – education, research and patient care. This also means that we value our faculty carrying out these missions – as investigators, clinician/scholars, and clinician/educators. Based on the discussions we had at the 2009 Leadership Retreat we have not achieved this goal – especially for clinician/educators. A number of departmental task forces were assembled this past year to come up with creative strategies to better understand and value the role of clinician/educators. We will be discussing those reports at upcoming Executive Committee meetings. Again, I will share those results with you in future Dean's Newsletters.
- In addition to improving the role, contributions and value of clinician/educators, we have also been further developing the criteria for assessing clinician/scholars. Specifically, metrics for evaluating clinical performance have been added to the appointment and promotion process and in the near future, improved criteria for assessing the impact of contributions to education will be added. We want to affirm the importance of high quality patient care as well as teaching as criteria for promotion.
- A number of important leadership searches are currently underway, including the chairs of Psychiatry and Dermatology and the Medical Director of the Cancer Center, and we anticipate a number of new leadership searches during 2010. Each of these searches and of course the candidates ultimately recruited to Stanford will have a major impact on our future. As I have noted in prior communications, our most important resource is the quality and excellence of our faculty, staff and

students, and identifying and recruiting the very best talent we can find will truly shape our future.

- ***Compliance and Regulation.*** Over the last decade the number of compliance and regulatory requirements for faculty and institutions has grown enormously and now consumes vast amounts of time, energy and resources. The impact of these compliance and regulatory requirements on each of our missions is enormous, especially when coupled with the number of institutional and departmental accreditation and certification requirements. I recognize that the goal of many of these policies and rules is to protect students, research integrity, patient confidentiality and safety, as well as institutional integrity and the public trust. Nevertheless, a general outcome has been that the requirements have become increasingly stringent, comprehensive and demanding over time.

We have worked with organizations like the Association of Academic Health Centers to help develop rational standards for some of the compliance requirements, and we have also been a leader in developing policies to address some onerous issues – including individual and institutional conflict of interest (see: <http://med.stanford.edu/coi/>). This is an evolving area and one in which Stanford has shown leadership. But it is one in which rules and expectations change relatively rapidly and vulnerabilities arise frequently. And it is one where the pendulum can swing too far in one direction or another, so that it is important to seek a balance that promotes innovation and an entrepreneurial spirit without compromising the public trust.

- ***Facilities and Infrastructure***
 - During 2010 the first phase of our on-campus master plan will be completed with the opening this summer of the Li Ka Shing Center for Learning and Knowledge and the Lorry Lokey Stem Cell Research Building (SIM1). Together with the below ground tunnels and infrastructures that have been put in place to connect buildings and move all deliveries underground, the School of Medicine will have spent nearly \$350 million in construction costs (which is more than the Graduate School of Business is spending to re-do its entire campus!). That said, these new facilities will provide major new resources for education and research and will begin the process of developing a medical school campus that looks and feels more integrated and coordinated. It will open a new door to the University and in particular the Science and Engineering Quad via Foundations Walk, and it will provide a corridor that links the Clark Center (and eventually Biology and Chemistry) to the school's research and education facilities along Academic Walk. We are planning opening ceremonies for early Fall and look forward to sharing these wonderful new facilities with you.
 - On the immediate horizon is the Jill and John Freidenrich Center for Translational Research, which will be housed at 800 Welch Road and which is slated for completion in 2012-13.
 - At the beginning of 2008 (before the economic meltdown) we anticipated that FIM1 (Foundations in Medicine I) would open by 2014 on the lawn footprint just north of CCSR, and that SIM2 would follow in around 2016. Now the timing of

these facilities is less clear, although we are proceeding with programmatic planning for FIM1.

- We are also examining all of our off-campus space, which currently includes a number of sites on California Avenue, Sand Hill Road, Arastradero Road and in Menlo Park and beyond to determine whether there are more creative and economically sounder ways of consolidating sites and potentially developing new opportunities that foster innovation and discovery.
 - And of course we are eager to help our hospital colleagues with the planned rebuilding of SHC and the expansion of LPCH. These facilities are still undergoing entitlement review by the City of Palo Alto, and a decision by the City Council is expected by the end of the year (or hopefully sooner). Taken together, the new facilities at the Medical School and both hospitals will transform the Medical Center in extraordinary ways.
- ***Information Resources and Technology:*** Thanks to the leadership of Dr. Henry Lowe and the IRT group he has assembled, Stanford Medicine has one of the most advanced and interactive websites of any medical school in the nation (or world). Special commendation goes to Michael Halaas for his many contributions. The continuing evolution of our web presence and its ability to create greater interactivity internally among students, trainees and faculty are incredible assets – as is its power to create greater connectivity to our communities locally and globally. Over the past two decades all of us have become more digital. This change has offered unique opportunities for accessing data and knowledge – but it also carries vulnerabilities in the areas of privacy, theft and misinformation.

We are also witnessing the incredible transformation of our library from a repository for books and journals to an on-line service that connects faculty, staff and students to knowledge sources at any time and from any place. This raises some important questions – including what the future of a medical library will be going forward and how we will differentiate Stanford from other medical schools. A strategic planning process for knowledge and library services is being completed and I will be happy to share the results when it is finished. But we are clearly in a new world order – and we want to play an important role in leading and directing the library of the future.

- ***Finance and Administration.*** In my last Newsletter of 2009 (see: <http://deansnewsletter.stanford.edu/#2>) I detailed the financial performance of the School of Medicine this past and very challenging year. Although we suffered major losses in endowment and received less support from foundations and philanthropic donors than in past years, we still emerged in a strong financial position. This is not to say that we haven't had challenges (we had to reduce expenses – especially in our central administration – by nearly 15%, and this has had consequent negative programmatic and human capital costs). But we have been judicious in our financial planning and have been benefited from strong leadership and oversight in this important area. Going forward, we must anticipate declines in research funding (with the expiration of the stimulus ARRA funding this September) as well as the still untold economic consequences of healthcare reform. Coupled with the overall financial climate in California and nationally, it is

imperative that we remain vigilant and prudent in our short and long-term planning. At the same time, we do not want to miss important opportunities in recruitment, programmatic innovation or facilities and infrastructure.

I have tried to be as transparent as I can be about our resources and how they are distributed between the central administration and the departments. I fully recognize that each faculty member has unique needs and certainly we would love to meet everyone's expectations. But for the foreseeable future, I expect our investments will need to be constrained and prudent – which will certainly result in some frustration and disappointment. But it is better that we be conservative and prepare for the future wisely than to overstep our financial bounds (as some peer institutions have done) and end up truncating our future opportunities. We also need to examine whether the way we are organized and structured to support our missions in education, research and patient care still makes sense – or whether other models for finance and administration need to be developed and employed.

- ***Communication, Advocacy and Public Policy.*** We have continued to make major strides in our communications internally, to our colleagues at Stanford and to the general public. I believe that we have among the very best offices of communication of any medical school in the nation, and I appreciate the leadership that Paul Costello and his colleagues have brought to this area. The contributions of the Office of Communication and Public Affairs to our website, to the media and in publications (particularly *Stanford Medicine*) are exceptional. So too are the Podcasts and other innovations that have been developed. A recent example is “Scope,” a blog from the Office of Communication and Public Affairs that covers achievements of Stanford faculty, students and staff, but also offers insights on medical and scientific developments around the world. Members of the Office of Communication and Public Affairs staff aim to discuss on Scope stories and issues that might not be given adequate attention or analysis by the mainstream media. The blog can be found at <http://scopeblog.stanford.edu>.

Scope is the latest offering in a series of new media initiatives from the Office, including its “1:2:1” podcast, which features interviews with notable scientists, policy makers and journalists; a Flickr photo stream; a YouTube channel; a Twitter feed; and a Facebook fan page. Links to those resources can be found at <http://mednews.stanford.edu>. And I will try to continue doing my part through the bi-weekly Dean’s Newsletter – now in its 9th year of continued reporting! In addition to communication, a number of Stanford faculty (myself included) have spent considerable time in advocacy and public policy issues around research, healthcare reform and education. A number of important contributions have been offered, and this will clearly remain an ongoing and important activity for many faculty, students and staff.

- ***Philanthropy and Resource Development.*** Key to our future success will be a robust fundraising program. As noted earlier in this Newsletter, the School of Medicine has raised \$1.17 billion since 2001, which has helped fund new facilities and programs. While the economic downturn that began in 2008 has affected our fundraising efforts, we have continued to enjoy and benefit from the incredible loyalty, support and generosity of

friends and alumni. On January 1st Laurel Price Jones joined the School as our new Associate Vice President for Medical Development (see: <http://deansnewsletter.stanford.edu/#3>). A key part of our past success has been developing a clear and focused message around priorities and then casting them as “big and transformative” ideas. This will need to be our goal going forward as we attempt to generate support for students, faculty, programs and facilities. Needless to say, this is an area that I am also heavily and personally invested in for the School.

As noted earlier, this list is best viewed as a series of priorities, ongoing activities, opportunities and challenges as I have been reflecting on them. The list is certainly incomplete and is not intended to be all-inclusive. My reason for sharing it with you is that these issues (among others) are ones that come to my mind as I think about the immediate and future concerns and challenges facing the school, medical center and university. I have left out information that is proprietary or still too confidential. But I have also tried to be transparent with the hope that you will feel free to add your thoughts, suggestions or recommendations. Please don't hesitate to share your views with me.

Best wishes for the New Year and beyond.

Appointments & Promotions

Christopher Barnard has been promoted to Adjunct Clinical Associate Professor of Dermatology effective 1/01/10.

Gregory A. Denari has been promoted to Adjunct Clinical Associate Professor of Medicine, Division of General Internal Medicine effective 9/01/09.

Mehran Farid-Moayer has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 1/01/10.

Bernard Fine has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of Hematology effective 9/01/09.

Nancy Hua has been promoted to Adjunct Clinical Assistant Professor of Medicine, Division of General Internal Medicine effective 9/01/09.

Manuela Kogon has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 1/01/10.

Vivian Levy has been promoted to Adjust Clinical Assistant Professor of Medicine, Division of Infectious Diseases and Geographic Medicine effective 1/01/10.

Vinod Menon has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences effective 1/01/10.

Judith A. Stewart has been promoted to Adjunct Clinical Assistant Professor of Psychiatry and Behavioral Sciences effective 1/01/10.

Dean's Newsletter

January 25, 2010

Trends in Healthcare: Some Forecasts from The Advisory Board and Related Reflections

The past year has been filled with forecasts of healthcare reform and its impact. As the Congress moves to its next phase of reconciliation and then a vote on its lumbering plan, we can begin to anticipate the many changes that will unfold over the next years. These will affect physician and provider workforces, physician compensation, the balance between specialty and primary care services, the graduate medical education pipeline, hospital services and the balance between inpatient and ambulatory care, hospital (and medical center) margins, and over time, cost controls. While the attention in the news has been on extending coverage and access to care, a focus on quality, information technology and the overall use of technology will continue to be major themes. The thorny but central issue of fee-for-service, when it is really addressed, will impact many of the current impasses— and the major constituencies who continue to lobby and press for sustaining the present (and past) rather than fully planning for the future.

The Advisory Board, a provider of comprehensive performance improvement services to the health care and education sectors, recently presented an interesting summary. While there are many views that will be at variance with their findings, some of the commentary is of interest and will likely be relevant to our own planning at Stanford Medicine. Among these is that 59% of institutions responding to a survey on patient volumes do not expect inpatient surgical growth in 2010. At the same time, many institutions believe that they have already made significant expense reductions in recent years – thus affecting their options on both the revenue and expense sides of the equation.

Overall, changes resulting from health care reform (although it is more uncertain at this moment about what is likely to happen this year) are likely to impact hospital margins that are sensitive to higher cost technical and procedural (including surgical) services. With changes in the economy as well as consumer education and overall costs, there could be more shifts away from surgical to medical or other treatment options – again affecting overall hospital revenues. Utilization management groups and decision support services that insurance companies are setting up to control expenditures will likely influence these shifts in the locus and scope of care. The forecasts, taken as a whole, predict that these and other changes will decrease inpatient services across a wide spectrum of disciplines. Utilization may also decrease in outpatient services, although less than for inpatient volumes.

While these are general projections and their impact will surely differ in various regions and communities of the country, it is hard to escape the conclusion that some features will have a local impact. In part this expectation also relates to overall changes in national and institutional economic foundations that affect debt capacity, investment income, operating income and philanthropy. The economic downturn has influenced each of these factors and has resulted in a lower capital base against which to secure debt capacity or investment income. I have written

about the effects of these changes on the university and medical school (see: http://deansnewsletter.stanford.edu/archive/12_14_09.html#2), and there is every reason to believe that they will also impact our healthcare facilities equally if not moreso.

At most academic medical centers – as well as medical centers in general – most projected growth is in Medicare, which has significant implications since Medicare reimbursements are significantly less than those of commercial payers. With an increasing chronic disease burden in the USA, costs will increase along with pressures to increase cost effectiveness and improve coordination – which clearly makes sense. This will be accompanied by a number of new accountability and bundling models of care – something that I hope we can impact as we establish, together with Stanford Hospital & Clinics (SHC), a new Center of Quality and Effectiveness later this year (with details to follow in a future newsletter). To control costs (or, in the new vernacular, “bend the cost curve”) a better balance of in-patient and ambulatory services along with utilization of technology and higher cost practices and procedures will be sought – although like all of these changes, they will likely unfold over an extended timeline. On a local level, opportunities to improve care delivery, coordination, quality and cost will likely be fostered – and Innovation Zones have been advocated to stimulate these initiatives.

The Advisory Board (as noted above) has put forth some possible implications of the interplay between increasing the number of individuals in the USA covered with insurance together with payment innovation and delivery system reform. Again, these are still opinions but they should provoke critical thinking. They include the following:

1. The transition to outcomes –focused reimbursement will materially increase risks to revenue growth
2. Operating efficiency will challenge top-line growth as the driver of future inpatient profitability
3. Bundled payments and other reimbursement innovations will make specialty care more rare and less profitable
4. Rewards in primary care practice will evolve to focus on coordination, chronic disease management and population health
5. Total cost management will begin to supplant fee-for-service incentives in the health systems business model
6. All providers will maintain tighter and fewer affiliations across the delivery system
7. M&A (merger and acquisition) strategy will expand in scope to focus increasingly on (functional) vertical integration
8. Information-driven care, not simply information technology adoption, will ascend as a competitive differentiator
9. Consumer-driven health care will be driven (further) to the margins
10. New regulatory frameworks and entities will emerge

I share these observations more to provoke discussion than to provide a specific set of predictions. As I stated at the outset, a lot of pundits have offered forecasts about healthcare reform. That said, now more than a year into the debate and political and legislative process, some things are becoming clearer and more likely. At a minimum they compel us to think creatively about how to lead rather than wait for change to emerge or be instituted and to think

more broadly across the domains of inpatient and ambulatory care to develop ways of improving the health of local and regional communities. There will not be a single solution but there will be lots of opportunities for change and evolution. Like all evolutionary processes a lack of adaptation to a new landscape can have serious consequences for individuals and institutions. And since healthcare systems are likely to change over the next decade, the need to be thoughtful and creative is an imperative for all of us.

Human Tragedy Comes on Different Scales But Is Always Painful

It is natural that we feel the loss of individuals who are members of our family and community. On December 17th Dr. Brant Walton, a young and promising faculty member in the Department of Anesthesia, died of colon cancer, leaving his wife Melissa and 3-year old son Will. His friends and colleagues felt his loss deeply and acknowledged his life in a ceremony at Memorial Church on January 19th.

On January 7th, Dan Begovich, husband of Stanford University Board Member Mariann Byerwalter, died unexpectedly, leaving behind his wife and three young boys – Joseph, Daniel and Neal. Hundreds of members of the Stanford, Bay Area and global communities shared his loss and celebrated his life in an exceptionally moving and meaningful memorial service at St. Catherine of Siena Catholic Church on January 14th – also Dan's birthday.

Death is part of the human condition and something we all will face. As a pediatric oncologist and AIDS specialist for children, I have witnessed the death of children over a number of decades. Even when death comes as an end to suffering, it creates a deep void in those left behind – especially family, friends and community. This void runs even deeper when death occurs suddenly and unexpectedly or at a young age and for those leaving behind young families. And it can impact our collective human consciousness, as it did with the recent tragedy in Haiti. The catastrophic events that have transpired in Haiti over the past nearly two weeks is beyond words. Many have reached out to help as best as they can, including a dedicated group of physicians and nurses from the Stanford Emergency Department (see: <http://med.stanford.edu/ism/2010/january/haiti-team.html>). They deserve our deep admiration and respect.

I also want to thank the Stanford community for contributing to the relief efforts in Haiti. One of the many forms this is taking is a challenge grant program from the Stanford Medical Center (including departments, Stanford Hospital and Clinics) and the President and Provost's office. To date more than 1000 individuals have made personal contributions totaling over \$118,000. The money will go to support operations at the Hospital Albert Schweitzer, which is located near Port-au-Prince. I thank Dr. Michele Barry, Senior Associate Dean for Global Health, for initiating this match program (see: <http://med.stanford.edu/ism/2010/january/haiti.html> for details on how to give to the challenge grant). I also thank the wonderful Stanford community for their support.

These personal and global tragedies are devastating – especially for the individuals and families directly and immediately affected. Our hearts go out to them. But these events are also reminders

of our human fragility and of why it is important to support each other, not only at times of crisis and loss – but throughout our lives as well.

Continued Work on Faculty Development and Leadership

Faculty diversity, leadership, development and satisfaction are enormously high priorities for me and for the School of Medicine. In numerous ways we have worked diligently to enrich diversity, promote leadership, foster faculty development and enhance career satisfaction. According to Senior Associate Dean Dr. Hannah Valentine, who updated our Executive Committee on January 15th, we have made progress in the past several years, especially since the Office of Diversity and Leadership that she leads was founded in November 2004.

In the November 23, 2009 Dean's Newsletter (see:

http://deansnewsletter.stanford.edu/archive/11_23_09.html#2) I provided updated results from the AAMC COACHE Survey, which assesses faculty satisfaction. Recognizing that every survey has its limitations, this follow-up study demonstrated that, among the participating institutions, Stanford faculty had the highest score among the subset designated as our peers as well as among all participating institutions on the two measures of "global satisfaction." Specifically, overall, more than three-quarters of those responding indicated that they are "satisfied or very satisfied" with Stanford as a place to work and (separately) that if they had to do it over again, they would still choose academia and Stanford as the place to be. This is good news and for many would be sufficient to say that we are doing well by our faculty. And while I do believe that we are trying to be as supportive as possible, neither I, nor Dr Valentine nor others in leadership positions believe that we have achieved all that we can or should.

Indeed, we believe we have work to do in creating the correct sense of value among those engaged in missions of education, research and patient care – especially education and patient care. We believe we have work to do in improving the services and resources to support faculty at all stages of career development, especially at the department and division level, in promoting an environment that fosters better balance between home and work, that addresses perceptions or realities of opportunities based on gender and ethnicity, and that does a better job in mentoring and guiding faculty through their career development. These are not new topics or issues, but they are ones that require additional effort. In fact they are themes we will be discussing further at the Annual School of Medicine Leadership Retreat on February 5th.

One initiative that has achieved unquestioned success and broad respect is the Faculty Fellows Program, which graduated its fourth class on January 20th. This program brings together faculty from clinical and basic science departments and creates small communities guided by a faculty mentor along with community sessions that explore the careers and life journeys of Stanford leaders. I had the opportunity to speak to this group last year along with the President, Provost and others from the medical center and university. At the graduation dinner the fellows reflected on how the program benefited them individually and even collectively. Among the most important lessons I learned from their comments is the importance of community and how their experience as Faculty Fellows connects them in a significant way with each other, the medical school and the university. They have the opportunity to learn about leadership through the stories and experiences of others and from each other. And their personal assessments, reflected through

the eyes of Julie Moseley, Director of Organizational Effectiveness, provides each of them with new and invaluable insights for self reflection.

I offer my commendations and congratulations to the 2009 Faculty Fellows and look forward to working with them in the years ahead. This year's Fellows include:

Timothy Angelotti	<i>Associate Professor of Anesthesia</i>
Juliana Barr	<i>Associate Professor of Anesthesia</i>
Preetha Basaviah	<i>Clinical Associate Professor of Medicine</i>
Helen Bronte-Stewart	<i>Associate Professor of Neurology</i>
Kay Chang	<i>Associate Professor of Otolaryngology</i>
Waldo Conception	<i>Associate Professor of Surgery</i>
Firdaus Dhabhar	<i>Associate Professor of Psychiatry</i>
James Fann	<i>Associate Professor of CT Surgery</i>
Lauren Gerson	<i>Associate Professor of Medicine</i>
Geoffrey Gurtner	<i>Professor of Surgery</i>
Peter Kao	<i>Associate Professor of Medicine</i>
Anna Messner	<i>Professor of Otolaryngology</i>
Ruth O'Hara	<i>Associate Professor of Psychiatry</i>
Steve Roth	<i>Associate Professor of Pediatrics</i>
Richard Shaw	<i>Professor of Psychiatry</i>
Gavin Sherlock	<i>Assistant Professor of Genetics</i>
Rebecca Smith-Coggins	<i>Associate Professor of Surgery</i>
Julie Theriot	<i>Associate Professor of Biochemistry</i>
P.J. Utz	<i>Associate Professor of Medicine</i>

In addition to congratulating our 2009 Faculty Fellows I also want to thank the incredible contributions of this year's Faculty Mentors. They really helped to make the program the success it turned out to be and we are deeply indebted to them. They included:
